good coating of cocoa-nut fibre refuse—a capital medium for protection—and a mulching I found agreeable to the plants.

I have invariably found the early part of June to be the best period for planting out stock propagated the previous season, as the plants then had the summer entirely before them in which to take full hold of and make thorough acquaintance with their new quarters. I should, except in very favoured gardens, strongly advise that the broad-leaved caulescent forms, such as *K. caulescens*, *K. Northiæ*, &c., should be planted in the warmest and most sheltered situations, and even under such favourable circumstances, it would be wise to protect them in severe weather, as the fleshy stems of these species are extremely liable to be hit during a spell of hard frost. Then, again, the Leichtlinii race, some of which are deciduous, should receive an extra covering of fibre, dry leaves, or mats, with a hell-glass or

young stock may be plunged in a cold frame, where they will at once commence to root, and thus form sturdy vigorous plants during the winter and spring, in readiness to turn out when the planting period shall have again come round, when the young plants would start into immediate growth without having received any appreciable check.

Plants obtained from the nurseries in the autumn are all the better for the same treatment, while those received in pots may with advantage be given the protection of a frame, or be plunged under and at the sunny side of a sheltering wall or fence, always bearing in mind that December, January, and February are the worst months of the year for removal or division.

It will, by way of precaution, be well to propagate the more tender and scarcer forms as soon as they become strong enough to do so, as it is a very safe policy to have a spare plant or two in

reserve in case a specimen or original plant may suddenly fall into ill-health, and ultimately disappear altogether, a casualty that sometimes occurs after a wet sunless summer, as the past has been, especially if such a summer should be followed by a wet winter, and a subsequent period of sharp frost in spring. The more robust growers, such as *nobilis*, *Saundersii*, *Le Géant*, *nobilis pallida*, *Uvaria largiskapa*, &c., having good constitutions, may with safety be let alone as long as they appear to be happy and content with themselves, and the conditions under which they exist, having recourse only to the breaking-up process when the plants show signs of deterioration, or declining vigour. *W. J. Grant, Monmouthshire.*

KNIPHOFIA NORTHLE.

This fine-foliaged species of a handsome genus of autumn-blooming plants has been recently fully botanically described in the *Gardeners' Chronicle* by Mr. J. G. Baker, F.R.S., and the accompanying illustration of the entire plant, as now growing in the open air at Belgrove, gives a good idea of the fine appearance of its handsome foliage (see fig. 45, on the opposite page). It is, however, only valuable, from a horticultural point of view, for its foliage, as its flowers are unfortunately of no beauty whatever, having, when produced under glass, as in the Succulent-house at Kew, when more or less starved in a pot, a pale green tube with white tips; and when bloomed in the open air from a fully-nourished plant, flowers of a dull orange colour with lighter tips. *W. E. Gumbleton.*

[Our engraving was reproduced from a photograph of the plant taken by the Rev. C. W. Roberts, Middleton, co. Cork. E.S.]

NEW OR NOTEWORTHY PLANTS.

AÉRIDES LAWRENCEÆ, *Rehb. f.*, VAR. AMESIANA, *Sander.*

This is a new and wonderful variety of a handsome plant. The flower-stalks are more than 2 feet long, and except at the very base, densely crowded with richly-coloured and splendid flowers. In size, the flowers rather exceed the largest of those of the typical *A. Lawrenceæ*. The general colouring is a light orange-yellow, spreading over the whole flower to the top of the spur, which is not green as in the type. The purple tips of the sepals and petals, and the middle lobe of the labellum, are larger, and the purplish line in the throat of the labellum is broader, and bordered with many radiating stripes of purplish spots, and blotches of the same colour.

As regards the flowers only, there can be scarcely a doubt that we have before us but a darker-coloured form of the var. *Sanderiana*; but a glance at the whole plant shows us that we have to do with a specimen which, if there were no identity in botanical characteristics of the flower, must be regarded as a true species. It is well known that *A. Lawrenceæ*—the type—is a sturdy grower, with leaves 2 feet in length, and of considerable breadth; it is also known that the *Sanderian* variety, with its deeper-coloured flowers, has much narrower leaves, which are shorter than the spikes, and a more flaccid growth. In our new variety, *Amesiana*, we find a growth even more robust than in the typical *A. Lawrenceæ*, with shorter, more rigid, darker green leaves, which are much shorter than the spikes; and these characteristics are further marked by the presence of the darkest colours to be seen in any *Aérides*.

A gardener as well as a botanist who studies not the flowers alone, but the whole plants, will easily distinguish the type and the two varieties from the habit of growth, and he might suppose that these three different kinds of stems and leaves must produce three different forms of flowers; but man proposes, and these capricious Orchids dispose. As the growth of *A. Lawrenceæ Amesiana* is quite dis-

tinct, and the leaves are shorter, darker, and stronger than even in the typical plant, and quite different from those of Mr. Sander's variety, it is certain that we have not in this case to deal with "natural hybrids." This term is the flag beneath which all little-known variations of well-known species sail; but that we must admit an extent of variation greater than we supposed before, and large enough to include, perhaps, still more varieties.

We received splendid specimens of leaves and flowers from Messrs. F. Sander & Co., St. Albans, who introduced the type in 1883, and this year sent out this new variety. If any doubt still remained, it must have been dispelled by comparing living speci-

FIG. 16.—MALE FLOWERS OF AÉRIDES LAWRENCEÆ. (SEE P. 395.)

mens, as we had the opportunity of doing on the occasion of our pleasant visit to St. Albans last July. *Dr. F. Kraenzlin.*

CYPRIPEDIUM GODEFROYÆ LUTEUM, *n. var.*

Flowering out of a batch of the ordinary *Cypridium Godefroyæ*, in the nurseries of Messrs. Hugh Low & Co., at Clapton, is an extraordinary form with flowers, in which the ground colour is of a clear soft primrose-yellow, and the spotting pale rosy-lilac, in its softness of tint very different from any other form of *C. Godefroyæ*, not forgetting the variety with a yellow ground colour, previously named by the late Professor Reichenbach *C. Godefroyæ hemixanthemum*. It is a very delicately tinted and pretty form, and a decided novelty. *J. O'Brien.*

KEW NOTES.

WATSONIA IRIDIFOLIA VAR. *O'BRIENI*.—This plant was introduced and flowered in September of 1889, by Mr. J. O'Brien, who exhibited it at one of the meetings of the Royal Horticultural Society, when it obtained a first-class certificate. Mr. N. E. Brown described it in the *Gardeners' Chronicle*, vol. vi. 1889, p. 330, as "a lovely plant, very similar to *W. rosea* in general appearance, but with pure white flowers, and fragrant. This year some bulbs of it were obtained for Kew from Port Elizabeth, and these are now flowering out-of-doors. The stoutest plants bear scapes 4 feet high, with five or six branches, and numerous long-tubed broad-mouthed flowers, fully 2 inches across, and of the purest white. There are from twelve to twenty flowers on each branch, arranged distichously, about ½ inch apart, and four of them open together on each branch. In habit and size of leaf and inflorescence, there is very little difference between this and the so-called species *W. Meriana*, *W. rosea*, *W. angusta*, and several others. I have never seen *W. roseo-alba*, which I believe is cultivated in Holland as *W. alba*; does it differ from Mr. O'Brien's plant?

Watsonia densiflora var. *alba*.—This is another pure white-flowered variety of a species the type of which may be seen in the *Botanical Magazine*, t. 6400, where it is represented with rose-red flowers from a plant introduced from Natal by Messrs. J. Veitch & Sons in 1878. We received seeds of the white-flowered variety from Natal two years ago, and the plants raised from them were kept in a border in a cold-house until May this year, when they were put outside in a round bed on the south side of the T-range, where some of them are now in flower. In the *Botanical Magazine* the leaves of *W. densiflora* are described as linear, reaching a length of 1½ foot, and a breadth of half an inch, but in the white-flowered variety now in bloom at Kew the leaves are 2 feet long and 1 inch broad, very rigid, with a yellowish margin, and a stiff almost spiny tip. The scape is over 2 feet in height, and bears a dense head or spike, 6 inches long, of tubular white flowers 1 inch long and broad, each springing from a brown close-fitting spathe-valve. These overlapping spathe-valves are arranged so regularly, and overlap each other so closely, that the head before the flowers burst through, looks like a long Wheat-ear. The plant is altogether distinct and pretty. Mr. Medley Wood, writing from Natal in 1882, with reference to the occurrence of the white-flowered variety, stated that "it is always found in company with the type, but is, I think, more plentiful in some seasons than in others." The plants now in flower at Kew prove that the white variety comes true from seeds.

Gladiolus Milleri.—Bulbs of this, received from the Botanical Gardens at Port Elizabeth, are now flowering freely in the open border at Kew. There are two colour varieties of it, one with white segments streaked with rosy-purple, the other creamy-yellow with brownish stripes. Both forms are pretty, and the flowers are as large as those of *G. handus*, and quite as numerous on the spikes. There is a figure of this species in the *Botanical Magazine*, vol. xviii., which volume, by the way, contains a number of most interesting Cape plants, Iridaceous chiefly. It is there stated that *G. Milleri* was raised from seeds by Philip Miller in 1757, and was figured by him as *Antholyza foliis linearibus*, &c. It very closely resembles *G. floribundus* and *G. undulatus*.

Zephyranthes candida is a most useful plant for edging borders, as may be seen by its behaviour at Kew, where a border containing *Belladonna* and *Jacobæa Lilies*, and other hardy hulchous plants, is edged with it. Its hardiness is shown by its not suffering in the least degree during the severe frost of last winter; and its sturdy constitution enables it to grow freely in poor soil, and bear division without a sign of suffering therefrom. All through the summer, its elegant dark green grassy foliage is studded with its starry pure white flowers, and it continues to bloom until the frost stops it. As a

pleasant change from the eternal Box edging, or a fringe to hide an ugly tile edging, this *Zephyranthes* ought to become a general favourite.

ORCHID NOTES AND GLEANINGS.

CYCNOCHES VERSICOLOR.

This rare and, perhaps, unique plant, so far as Europe is concerned, has again flowered in the collection of Sir Trevor Lawrence, at Barford Lodge, and two of the flowers have been sent to Kew for preservation. It was described by Reichenbach, in these columns, about three years ago (1888, November 24, p. 596). The plant bears a drooping raceme of numerous flowers, which measure 2½ inches in diameter. The sepals and petals are of a very peculiar olive-green, somewhat inclining to yellow, very difficult to describe, and like velvet. The lip is ovate-elliptical, acute, and very fleshy, in colour pale whitish-yellow, a little dusky at the base and sides, and with about eight to twelve red-brown spots in front of the pair of erect fleshy tubercles in the centre of the lip. The slender column is light green, with numerous small black spots on the basal half. The flower is a male, and thus belongs to the same section as *C. Loddigesii* and *C. chlorochilon*. Some of these days it may surprise us by producing female flowers, an event awaited with considerable interest.

CYCNOCHES CHLOROCHILON ♂ and ♀.

Attention was called to the production of flowers of both sexes of this handsome species in the collection of M. Houzeau de Lehaie, at page 69 of this volume. Immediately afterwards, both sexes appeared in the collection of Messrs. F. Sander & Co., of St. Albans, and during a visit to that establishment the other day, I observed, in a fine batch of this species, two plants, both of which bore a single female flower. Several males were also in flower, but in no case were both sexes borne on the same individual. M. Houzeau has now flowered both sexes on the same plant, thus removing all doubt as to their specific identity. They are being preserved at Kew. It is rather interesting to record the fact that no fewer than four individuals should suddenly produce female flowers in one season, especially as the males alone have been known for so many years. *R. A. Rolfe*.

AREUNDINA HAMBUSIFOLIA, &c.

This pretty *Sobralia*-like Orchid is at present in flower at Clare Lawn, East Sheen. The flowering-stems are 1 foot high, clothed with its bright green leaves. The sepals and petals are coloured magenta-rose; the lip is of rich rose, and the throat white striped with orange. It is a plant that grows freely in the stove, and forms a useful addition to the Orchids which flower at this season. Another pretty Orchid in flower is *Catasetum Bungeorthii*. Contrary to the usual practice, we grow our *Catasetums* in the same material as the *Calanthes*, viz., fibry loam and a little peat, sand, and cow-manure, and the manner in which they grow and flower testifies to the suitability of this kind of compost. One plant has seven large flowers. *W. H. V.*

ORCHIDS AT MESSRS. HUGH LOW & CO.'S.

In the Clapton nurseries the *Cattleyas* are in an especially fine condition this season, the later-flowering ones as *Cattleya Trianae*, of which there are large quantities, promising well for bloom. The *Cattleya Gaskelliana*, which are now nearly past their best, have made a great show, and some fine and highly-coloured forms remain; also a good specimen of *C. Gaskelliana albens*, flowers pure white with a light tint of rose on the labellum. Two houses full of healthy plants of *Vanda cœrulea*, and a like quantity of the favourite *V. Kimballiana* were to be seen lately, with many of the imates in bloom—one fine specimen of the former having nine spikes of flowers. In the *Angraecum*-house a pretty group was made up of specimens of the white *A. articu-*

latum, arranged with flowering plants of *Dendrobium formosum giganteum* and *Odontoglossum Roezlii*. The *Phalenopsis* are in grand health, but with little flower at this season; and the six neat span-roofed houses which shelter the *Cypripediums*, have in bloom some grand examples of *C. Parishii*, many *C. Godefroyae*, among which is a new yellow form; a quantity of *C. niveum*, *C. bellatulum*, and other species and crosses. Amongst other Orchids in bloom here were *Odontoglossums*, *Aerides Lobbii*, *Acineta densa*, *Stanhopea Wardii*, *Catasetum fimbriatum*, many *Lælia Dayana*; a fine lot of the large-flowered form of *Oncidium cucullatum*, *Lælia elegans*, *Masdevallia macrura*. *Dendrobes* are very extensively grown at Clapton, and very fine flowering growths are now being completed on the thousands of *D. Wardianum Lowii*, and other showy species.

LÆLIA GRANDIS TENEBROSA.

A handsome form of this variety is in flower in the collection of G. C. Raphael, Esq., Castle Hill, Englefield Green. The flower, as seen, is 7 inches across; the sepals and petals of Indian yellow colour, tinged and obscurely veined with purple; the labellum, which is equal in size and showiness to that of a *L. purpurata*, is white at the base, which is marked in close stripes with purple, deepening in the middle of the lip to maroon; the front and side lobes of the lip have a broad lilac margin, into which the purple lines of the basal portion extend. The flower, in addition to its being handsome and lasting, has a delicate fragrance. *J. O'B.*

COCHLIODA NOEZLIANA.

Flowers of this handsome cool-house Orchid, from l'Horticulture Internationale, Park Leopold, Brussels, demonstrate the fact that its merits were underrated by its introducers, and that even the showy plate in the English edition of the *Lindensia*, February, 1891, fails to depict the beauties of its individual flowers, although it gives a good representation of its general character. The flowers before us are fleshy in texture, about 1½ inch across, and closely arranged on the racemes. The flowers are orange coloured, the petals, sepals, and side lobes of the lip being overlaid with vermilion, which contrasts well with the clear orange colour on the lip, and the prominent orange-coloured column, with its curiously-hooded reddish apex. It has proved a very free plant in the *Odontoglossum*-house, and when thoroughly established in gardens, it will be a great favourite. *J. O'B.*

MILTONIA VEXILLARIA SANDERIANA, n. var.

Out of the thousands of the different types of *Miltonia vexillaria* which have been imported by Messrs. F. Sander & Co., and flowered at St. Albans, many distinct and handsome varieties have appeared, the best of which hitherto recorded, perhaps, is *M. v. Leopoldi*, which it was thought could not be surpassed. Now, however, another grand form has flowered, which, for distinct characteristics, showiness, and rich colouring, would be preferred by most connoisseurs to any other variety. The plant is of robust habit, with unusually broad leaves, and long gracefully arching scapes, which bear flowers of the size usually found in the large-flowered forms of the species. The sepals are white, suffused with a bright rosy-flush, the two lower ones having dotted lines of crimson near the column; the petals are broader and rather darker in tint than the sepals; and the labellum, which is the more attractive part, is slightly shell-shaped, and concave, which may or may not be a constant feature. At the base of the labellum, and extending forward in the middle line, nearly to the cleft in the front lobe of the lip, is an irregular triangular blotch of bright purplish-maroon, with several thick lines of the same colour of various lengths running from the main blotch on each side, the middle one being the longest. The rest of the lip is bright rosy-crimson. Description fails to do justice to this grand variety, although it serves to record it. *James O'Brien*.

FRUIT PACKING.

HAVING received applications for further details in connection with the best system of packing fruit to prevent decay (see *Gardeners' Chronicle*, August 8, p. 157), I applied to Professor F. H. Storer, of the Bussey Institution, Mass., U.S., who very courteously supplied me with the following information. As the subject is of great practical importance to all fruit growers, I venture to give the main portion of Professor Storer's reply:—

"The common method of keeping fruit here, and it is practised upon a very large scale, is by 'cold storage.' Special houses are fitted with apparatus similar to that used for making artificial ice, by means of which an atmosphere of chilled air is supplied constantly to the fruit."

Professor Storer is assured, however, by very competent observers, that while the process above mentioned is essential for the preservation of the softer fruits, such as those Pears which ripen in late summer or early autumn, much simpler means will answer for "winter Apples," such as ripen in October. In Massachusetts, winter Apples are, in fact, preserved perfectly by packing them in barrels, and storing the barrels in a house "built like an ice-house;" that is to say, the house is built with a hollow wall, which is packed full of dry sawdust. Or rather, when Apples are to be stored, the hollow wall is built with a partition (down the middle of the hollow space), so that the actual wall of the house is lined inside with two distinct vertical layers or walls of the non-conducting sawdust; which ensures a very constant temperature inside the house.

In October, after the Apples have been put in, the storing-house is left open in the cool autumnal weather until it has come to a temperature of about 40° Fahr., in all its parts, when it is closed for good.

It is said to be well, however, to test the temperature occasionally by thrusting a thermometer into the house through a small window or shutter; and in case the temperature should be found to be any higher than 45° Fahr. or so, a door should be left open for some hours in order that enough of the winter air outside might be let in to cool down the whole house.

We are given to understand that this simple method is applicable only to winter Apples, or to winter Pears, which naturally keep a long while—namely, which normally live a long life after they have been plucked from the tree.

Professor Storer considers the subject of great importance commercially, and of high scientific interest, and suggests that some competent, practical man, be sent to New England, for the purpose of collecting information, and to report upon the American methods of preserving fruit. *J. J. Willis, Harpenden*.

NOTES ON GRAPES AT EDINBURGH.

The display of Grapes at the International Show, recently held, was in many respects a most remarkable one. One striking feature to be found throughout the exhibits was the excellent finish, with scarcely an exception. The bunches, taken as a whole, were of large size, hardly any of abnormal growth were to be found without including those, as a matter of course, which were shown for mere weight of bunch. With respect to the varieties shown, there were some instructive facts worth noticing. Of black Grapes, *Gros Maroc* has come prominently to the front since the last exhibition of this kind was held. Admitting that it is not of first-class flavour, no one will deny that it is a noble-looking Grape, and one which usually finishes well; it was shown in remarkably fine condition by several exhibitors. The mistake made, however, in more than one instance was that of insufficient thinning. Where this had been done sufficiently, the berries were of great size, adding greatly to its appearance. *Alnwick Seedling* was to be found in

fine condition from several growers, some showing the large double bunches which this variety produces when very vigorous; others had the smaller bunches, but with berries approaching Gros Maroc in size. These latter were more taking in appearance, being also better suited for the dessert dish. Gros Colmar was shown of excellent colour by a few exhibitors, in one instance both finish, size of bunch and berries were all one could desire. Other exhibits, however, wanted a longer time to bring them to perfection, notably the bunch to which the 1st prize was awarded for weight in the black class. The present can hardly be considered a good season for this variety, which is in best condition after the New Year, the flavour then being considerably better. The old favourite Black Hamburg was shown well by a few exhibitors only. These few were very fine as regards bunches and colour, but hardly so large in berries as are at times to be seen. The quality of the Black Hamburgs in one instance, no doubt, weighed heavily with the judges

which were usually well coloured—some were not quite ripe. This variety was shown in all-round better condition at the Crystal Palace the previous week, so also was Black Hamburg, as a whole. Some first-rate examples of Lady Downes' Seedling were shown, the bunches being of large size and well finished—in some few instances a more liberal thinning would have improved them, as well as adding to their better keeping qualities. Mrs. Pince, mostly a fickle variety, was in a few instances shown well, being even better coloured than usual—in one case the berries were very fine, but the colour not good; this variety, like the Muscat Hamburg, does not evidently find general favour, even with the northern growers. A few large clusters of Gros Guillaume of excellent colour, and with large berries, were shown. If, however, it is compared with other late Grapes, it is surpassed for utility and for flavour also. On the exhibition board it looks well when staged, as in a few instances on this occasion; it is, however, but a show

mended for extended culture in any case. I was pleased to see such good examples of Golden Hamburg, the best being very fine of the kind, both in berry and colour, the bunches also much more compact than this Grape is usually seen. This Grape does not appear to be so much grown now. Buckland Sweetwater has no doubt in a great measure taken its place. The examples of this latter Grape, however, were not so good as those of the Golden Hamburg. The Buckland is, I consider, better grown as a second early kind when it has a chance of being used sooner; if kept too long there is a loss of flavour, and it is not much better than a bag of water. In this respect the preference must be given to the first-named kind. Some few well-coloured and in other respects capital bunches of Raisin de Calabre were staged, this Grape must, in spite of this fact, be classed with Gros Guillaume as a mere show kind. Some few excellent bunches of Foster's Seedling were shown, these should, as far as flavour is concerned, have occupied better positions. Until Muscat of Alexandria is well ripe, it is still one of the best Grapes for dessert. It should, I think, have had a class to itself, as well as Buckland Sweetwater. Canon Hall Muscat, in a non-competitive group, was in prime condition, the berries large and well-coloured. It was not well-represented in the competing classes. The following Grapes were not shown, or if present, only second-rate, viz., West's St. Peter's, still an excellent variety, and far better in flavour than many late kinds; Mrs. Pearson, which, when well grown, is a splendid Grape, both as regards appearance and flavour, hanging well after it is ripe—it should, I think, take the place of both Buckland Sweetwater and Raisin de Calabre. White Tokay: this does not seem to be grown so much now; some first-rate bunches of it and Mrs. Pearson were, however, staged at the Crystal Palace the week previous. White Lady Downes' I did not see either, and it is rarely to be seen in anything like good condition. Black Prince, which a few years back would have found a place for size of bunch alone, was absent; so also was Trentham Black and the Frontignans.

Of the new Grapes not yet in commerce, the palm must be given to Black Duke, of which, no doubt, we shall see more examples another season; it bids fair to be an excellent keeping kind, with the additional advantage of superior flavour and a good constitution. Appley Towers Seedling, shown against it, was not sufficiently ripe, but it is a most promising kind, the bunches compact, the berries large and well coloured. This exhibition of Grapes must be considered as one of the best displays ever brought together, and that in spite of a season which has not been the most favourable in many respects for attaining a high degree of finish. *Vitis.*

ABIES WEBBIANA.

In order to complete our illustrations of this noble species, we now add details of the young cone as sent to us some months since by Mr. Rashleigh, of Menabilly. The drawing (fig. 47) tells its own tale, save in so far as regards the hue, which is of the deepest violet or plum colour. The foliage is remarkably handsome, bold, and silvery-white on the under surface, so that this species, at any rate in the southern counties, may be commended as one of the handsomest. We have seen it doing well in Shropshire, but how far north it may be grown successfully we cannot tell. As a denizen of the Himalayas, it is not cold that it fears so much as damp, and the treacherous character of our springs.

FOREIGN CORRESPONDENCE.

MARKET MEASURES.

CHICAGO, ILL., U.S.A., August 6, 1891.—I am a subscriber to the *Gardeners' Chronicle*, and generally lend it to friends who cannot afford to subscribe for it; and weekly or oftener some of them come to me

FIG. 47.—ABIES WEBBIANA. YOUNG FEMALE CONE; RICU PURPLE LEAVES, SILVERY-WHITE BENEATH.

in making their awards; one bunch shown in a single bunch class was a model of this standard kind. Madresfield Court fully maintained its reputation as a Grape of the first rank. It was grandly shown in one instance, the berries of that peculiarly large size and depth which is indicative of careful thinning. In nearly every case, this kind was coloured well, and without traces of "cracking," which, considering the season, speaks well for those exhibitors who showed it in such good form. Muscat Hamburg was but poorly represented; only in one or two instances was it to be seen in good condition as regards colour, size of bunch and berries.

The bunch to which the first prize was awarded for flavour in the black class was, in other respects, but a poor example, being of a foxy colour. Considering we have such a fine variety in Madresfield Court, between which and the Muscat Hamburg there is but little if anything to choose as regards flavour when well ripened, it does not seem worth while to continue its culture, the former kind having so many other points in its favour. Black Alicante was represented by some excellent all-round bunches,

Grape at the best, cropping qualities and flavour duly considered.

In Muscat of Alexandria the white Grapes were splendidly represented. Many of the exhibits were of superb quality in every respect. The competition, although good in the chief class, did not equal that at the International at Manchester on the last occasion. The colour of the 1st prize lots was in nearly every instance all that one could possibly desire to attain. The best of these Muscats were run closely by the three grand bunches of Golden Champion amongst one of the collections of fruits. These were probably as fine in berry, bunch, and colour as this Grape has ever been shown; the skin of the berries was perfectly clear, there being no trace of the brownish markings which often characterise this otherwise fine Grape. Duke of Buccleuch was not shown anything like as good as the foregoing, hardly an exhibition sample, with one or two exceptions being staged, the bunches being mostly small, but the berries good. Golden Queen in one instance was quite free from its peculiar blemish; it is not, however, a Grape that can be recom-

for explanations of terms they see in your columns, especially in those giving market quotations. For instance, in the last number you say, giving prices [The equivalents we have here supplied for our correspondent's edification. Ed.], Apples, half-sieve=14 imp. quarts; do., Tasmanian, case = 250 Apples; Cherries, half-sieve=14 quarts; Gooseberries, half-sieve=14 quarts; Lemons, case = 240 to 500; Celery, bundle = usually 20 heads; Mushrooms, punnet=7 inches in diameter, 1 inch deep; Mustard, punnet=do.; Seakale, basket = 12 to 18 heads; Turnips, bundle=one dozen; new Potatos, 6s. to 8s.—per cwt.; old Potatos, per ton—of 20 cwt.=2240 lb.

I am asked, what quantity, or weight, or count, is meant by half-sieve, case, bundle, punnet, and basket, and how many (pounds, or parts of bushel) new Potatos sell for 6s. or 8s., and how many pounds there are in the ton of old Potatos, which bring £7 sterling—that is, is it 2000 lb. or 2240 lb. that are sold for £7? Many similar questions are asked that I cannot answer. I think you could make an interesting article for your readers living outside of England by explaining all the various terms that are used in marketing fruits, and grain, and vegetables, &c. Here we use the short ton, 2000 lb., or the long ton, 2240 lb.; but invariably, where law does not fix the pounds, we say long or short ton, as the case may be.

We have bushels for various grains and vegetables and fruits, but each fixed at so many pounds to the bushel. We have in California and on the Pacific coast generally, centals (or 100 lb.) for grain, but everywhere else it is bushels. We know nothing of "quarters" except in English grain quotation, and then take it to mean 40 lb. of Wheat. We buy and sell Apples and other large fruits, Potatos, Turnips, Carrots, and like roots by the bushel (your standard imperial bushel is substantially our bushel); while Strawberries, Raspberries, Currants, Gooseberries, and the like are sold by the quart or pound; Cherries, by quart, pound, or 100 lb.; eggs, by the dozen or pound; Lemons and Oranges by the dozen, hundred, or box, and the size of box is fixed by law and known to all; Celery by the dozen, and that means one dozen bunches containing 25 stalks, heads, or roots, or whatever you may call the full complement of stalks that grow on one root. We use baskets, of course, but they range in size from ½-pint to 5 bushels, and the term is never used in buying or selling anything when any quantity or weight is at stake.

Peaches, Pears, and the like are often sold by the basket, but when that is done, we say "so much for 1 bushel basket, so much for half-bushel basket, so much for a peck basket," thus showing that basket refers only to the vehicle, and not to the measure. Run over your various quotations of measure or quantity, and you will find a hundred that are merely technical, and not known outside your own range. Even in selling meats, I see the same state of affairs existing, and it is very difficult for us to tell what your quoted prices really mean. We know what a pound is, or a gallon, or a bushel, or a dozen, or a score, or a long ton or a short ton, but cannot guess as to sieve, or case, or punnet, or basket, or bundle! D. O. C.

INDIA.

BOTANIC GARDEN, CALCUTTA.

The Report for the year 1890-91 shows that steady progress has been made in improving the Botanic Garden, not only as a scientific centre of the highest value to all botanical students, but also as a pleasurable and instructive resort to the public. More than 20,000 specimens were added to the Herbarium, illustrating the flora of regions so widely removed as Central Asia, Australia, Assam, Perak, the Shan States, the Khasi Hills, the Andaman Islands, and the Great Coco Island. Arrangements were also made for continuing the work of collection in Assam, Upper Burma, and the Andamans.

A third volume was added to the interesting series of garden Annals, containing monographs by Dr. King and Dr. Prain on certain Indian and Indo-Malayan species. The Lloyd Botanic Garden in Darjeeling, which is under Dr. King's supervision, is reported to be in good order. Under recent arrangements the Curator of this garden is charged with the task of improving the station of Darjeeling by planting and looking after young trees. In course of time, it is hoped that the damage done in past years by the wanton destruction of fine trees may be in some measure repaired.

CROSS-BRED ORCHIDS.

I had an opportunity recently to look over the large collection of Orchids which have been raised from seed in Mr. Cookson's garden at Oakwood, Wylam-on-Tyne. Much progress has been made in the work of hybridising with *Cypripediums*, *Dendrobiums*, *Calanthes*, and a few others of the more popular Orchids. I believe Mr. Cookson was the first to obtain plants of the cool-house *Odontoglossums*. An attempt is now being made to cross *Disa grandiflora* with the *Phaius*. It may fail, for many failures have to be recorded in this kind of work, but with each failure some useful lesson for future work is learned. I was much struck with the vigorous growth of *Phaius Cooksoni* ×, which is a recent acquisition raised by crossing *P. Wallichii* with the pollen of *P. tuberosus*. The flowers were fertilised on March 26, 1887; the seed vessels ripened in December of the same year, and the seeds were sown on the 16th of that month. The plants soon appeared, and grew so rapidly that the first flowering plant was exhibited at the Royal Horticultural Society's meeting in February, 1890. The seedling plants have made good progress, and some of them have been already divided. No doubt the plants have taken their vigorous constitution from the seed-bearing plant, but the flowers partake of the characteristics of the parents, and so distinct in their way that the plant itself may well be ranked as a true species.

P. tuberosus, a native of Madagascar, is quite distinct as a species. It is a species which is remarkably well grown by Mr. William Murray, Mr. Cookson's gardener, who has much improved the Orchids since he took charge of them. His method of culture is to attach the plants of *Phaius* to Teak rafts in the first place, on a base of living sphagnum moss, and these rafts are placed for a part of their depth in the usual compost of fibrous peat and sphagnum moss, with ample drainage. The plants had rooted freely down the Teak rods, and into the compost, which was kept moist, so that the sphagnum moss on the surface made healthy growth, and was full of vigorous roots. The warmest house is necessary, of course, for these plants. *P. Humblotii*, also introduced from Madagascar about the same time as the other, has proved to be a distinct and beautiful autumn-flowering species, easily grown now that its requirements have become better understood. Humblot, who gathered both species, says, that the plant grows at the base of large trees, in dense shade, and is in a moist state all the year round. It requires a hot and moist atmosphere, but not such close shading as one would suppose. The plant is well figured in the *Reichenbachia*, and the editor remarks that it should be "shaded from direct sunlight, but not heavily shaded, inasmuch as the strongest diffused light we can give it here only equals that in dense shade under a tropical sun." It requires a light compost, and succeeds well with pot culture. J. Douglas.

[It may interest some of our readers, as well as serve to indicate the possibilities of Orchid hybridising and crossing, if we supplement Mr. Douglas's words. A recent visit to Oakwood, afforded Mr. Murray the opportunity of showing his various treasures in crosses and hybrids, and of telling us what species of plants he had operated on. *Cattleya Wardiana* had been crossed with *Laelia purpurata*, *L. cinnabarina* and *Cattleya Mossiae*; *Dendrobium nobile*

var. *alba* and *D. japonicum*, this had produced the handsome *D. Cassiope* ×; *D. Macarthurii* and *D. Dearii*. In *Cattleya* crosses we found *C. Mendelii* × *L. purpurata*, *C. Dowiana* with the latter species; *C. Trianae* and *Laelia harpophylla*, *C. Lawrenceana* and *C. Mossiae*, *C. Dowiana* and *C. speciosa*. In *Dendrobiums*, *D. Bensonii* and *D. Macarthurii*, *D. albo sanguineum* and *D. nobile*, *D. Wardianum* and *D. luteolum*. *Cypripedium* furnishes many crosses, and we found *C. bellatulum* crossed with *C. Morganæ* ×; *C. Sanderianum* and *C. hirsutissimum*; *C. Godeiroya* with *C. superbum*, and with *Spicerianum*—most promising unions; *C. selligerum* and *C. Morganæ*; *C. Sanderianum* and *C. lo* ×; *C. Sanderianum* and *C. Veitchii*. The above shows what one gentleman is doing in the way of raising novelties from various species of Orchids, and, moreover, performing the work systematically, and with certain definite objects in view. It is almost needless to say, that the record of every cross is committed to writing, and a complete pedigree register kept. Ed.]

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

SEASONABLE OPERATIONS.—In order to keep up a stock of fruitful trees, a certain amount of planting, root-lifting, and relaying must be done annually, rooting out any trees which, through old age, have become unfruitful. Pyramids are usually planted near the walks in the kitchen or the fruit gardens; but, apart from appearances, this method of training the fruit trees has little to recommend it, the bush form being much better generally, the bushes cropping earlier, and producing finer fruits. Instead, therefore, of training up a stem leader, this is pruned back at about 2 feet from the ground, and others, the result of the cutting back, trained up at about equal distances from it. In a few years these shoots become in their entire length clothed with fruit-buds, and it is from such bushes that the best fruits are gathered. If the Apple be worked on the Paradise, and the Pear on the Quince, the bushes may be planted closely together, and a truly fine collection of each grown on a small piece of land. When these come into bearing, the aged or unfruitful trees in the open or on walls may be destroyed, the space being replanted with either cordons or some other favoured form, and in this way any scarcity of fruit will be prevented.

TOP-DRESSING.—This work may be commenced as the trees are cleared of fruit, removing the old soil to a good depth, some of the roots being brought to the top, the tips cut with a knife, and relaid in good soil. Apricots and Sweet Cherry trees may now safely be done, good loam, bone-meal, and mortar and burnt earth being used in the new compost. After this has been placed over and about the roots, tread it firmly, and give a mulch of straw manure. If it is not intended to severely root-prune Pears, the trees may be top-dressed, and where the trees are lacking in vigour a trench may be opened at a distance of 3 feet from the stem, removing the soil to the depth and width of 2 feet; then trim the amputated or bruised roots, and refill the trench with fresh compost. Pyramid trees will greatly benefit if done in this way, and much finer fruit the following season will be obtained.

ORCHARDS.—Where the land is known—by the small size of the fruits—to be impoverished, thorough soaking of the soil with farm-yard drainage or other manurial aid in a liquid form will do much good in strengthening the buds. If this be done now, and repeated at intervals of a few weeks during the winter months, the trees will be greatly benefited. Large orchards under turf should be grazed with sheep or cattle, and never should the grass be reserved for hay. H. Markham, Mereworth Castle, Maidstone.

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—There is not any better *Cypripedium* than *C. Morganæ* ×, and I would advise those amateurs who have it not, to procure a plant forthwith, for though the plant has seen big prices, it may now be bought cheaper than is likely to be the case for some long time to come. It is the

best of growers, handsome in foliage and flower-spike, with grand flowers in numbers, three and four on a stalk. The most suitable compost for the plant is one consisting of three parts peat to one of turf, from which the fine soil has been knocked out, and a small quantity of sphagnum moss, the latter being always used in the top layer, as it adds to the appearance of the plant, and is an almost certain indicator of the whole as regards moisture. *C. ceananthum superbum* × is another variety that is always admired, and which blooms at this season. The plant may be obtained at a moderate price. That many of the crosses of *Cypripedium* are amongst the most satisfactory-flowering Orchids for the dweller in large towns, I think no one will deny; and their easy cultivation, is another inducement to amateurs to grow them. *Dendrobium Phalaopsis*, a magnificent species, is now in flower. It is one that everyone should possess, the plant appearing to grow freely under the treatment accorded to *D. bigibbum*. *D. formosum giganteum* is another of the fine autumn-flowering Dendrobes, and the blooms being large and white, add greatly to its value. The plant requires a long rest, and to be kept dry, and never placed in a house with a low temperature to ripen its growth, the Cattleya-house being the best place for it. I may remark here, apropos of resting the plant, that the pseudo-bulbs must not be allowed, from want of water, to shrivel. The temperature of the East India-house should be kept from 68° to 70° at night, with a rise of 7° during the day by fire-heat; if by sun, then 15° will not do any harm, but air must be carefully afforded.

INTERMEDIATE-HOUSE.—*Cattleya pumila*, under which name I include *C. marginata*, *C. Dayana*, and *Lælia præstans*, are among the best of the dwarf Cattleyas, and these flowers are now opening, and will last in perfection for three weeks. We have plants in 8-inch baskets that have from twenty to thirty flowers each, almost enveloping the plant and basket. *Dendrochilum Cobbianum* is now showing its flower-spikes, and should any of the plants need re-potting, it will be done at once, the young roots pushing away from the base of the young pseudotubers when the flower-spikes have reached a length of 6 inches. *Epidendrum Wallisii* will require much attention, or thrips will soon begin to harbour in the heart of the new growth. A camel's-hair pencil wetted with saliva will either take out the young embryo thrips or stick them down in such a manner that they can do no harm. *Vanda Kimballiana* is opening its flowers, and demonstrating what a lovely Orchid it is. A well-known grower of Orchids the other day, classed it with *Phalaopsis* for beauty. *V. Kimballiana* should not be grown in a hot place, as the plants will then be sure to "spot" badly, but grown with the other Vandas in the Intermediate-house. The temperature of the Intermediate-house may be 60° at night, that of the Cattleya-house 65° to 67°, and the cool house at 50°. *A. G. Catt, Parkfield, Hallow, Worcester.*

FRUITS UNDER GLASS.

PINE-APPLES.—In the absence of sunny weather of late, much attention will have been required to maintain the plants in health, want of bright light causing drawn and weak leaves, and the late-fruiters need all the light possible, if well-finished fruits are looked for. Shading must now be entirely discontinued, and all shade-washes on the glass removed. Ripening fruits should be placed in a dry house to increase their flavour, and if a separate house is not at command, a dry room is a good place for the plants. Keep them dry at the roots. It is now a good time to re-arrange the house for the winter, separating those in fruit from the others, the successions requiring more ventilation and less water than the fruiters. These latter will require greater warmth and atmospheric moisture, carefully supplying them with manure-water made from guano; avoiding excess of moisture at the root or in the house, this causing weak leaves, and damaging the fruits. Keep the plants steadily moving, with a genial growing bottom-heat, and do not get the roots in a parched state by overheating the hot-water pipes; indeed I prefer to rely on a bed of tan, or tree-leaves and stable-dung, to any great use of fire heat. If such heating materials are employed, it is well to add some fresh tan, leaves, &c., taking care not to allow the heat to rise higher than 90°. A few degrees less is better than 1° above 90°, unless the plants are short of roots, when 90° is a safe tem-

perature if the watering be done with care. The temperature by day may range from 75° to 85°, according to the weather, with the temperature at night being 70°.

Successions will require less heat, but they must be kept growing, and to this end the sunheat should be utilised as much as possible, the night temperature being kept at from 60° to 65°, the minimum being that of cold nights; the day temperature should be 70°. Overhead syringing may now be discontinued, sufficient moisture being supplied by damping down. When fermenting materials in large quantities are made use of, prepare it in advance and under cover. Suckers, which have been grown in frames will now require more warmth than a frame affords, re-potting the stronger ones, and plunging these in a bottom-heat of 80° to 90°. I do not like the very late potting of Pines, and would only re-pot those that might require it badly; and do not afford them a large shift, keeping these re-potted suckers close for a short time, and water them very carefully. A night temperature of 55° to 60° will suffice for such suckers as were potted late in the summer, and are well-rooted. These have no need to be grown quickly, but just kept moving throughout the winter. Plants taken out of frames are apt to suffer at the roots from want of water when brought into a dryer place, and require attention accordingly. *G. Wythes, Syon House, Brentford, W.*

THE FLOWER GARDEN.

HARDY PERENNIAL FLOWERS.—Just now, when we are dolefully anticipating the change the first frost will make in the beds of Pelargoniums and tender plants generally, one's thoughts naturally revert to the variety, beauty, and easy culture of a host of hardy perennial herbaceous plants, which are not in the least injured by a few degrees of frost. And the question will be asked, could not these plants be grown where tender and half-hardy ones now occupy the beds in summer and early autumn? Geometrical-shaped beds in parterres are unsuitable for many kinds of herbaceous plants, but isolated beds—or a number of them put together without geometry—on the lawn, and filled with bulbous and the ordinary summer bedding plants, might well be planted with a selection of hardy perennial plants, which would afford a good succession of flowers. These latter might be intermixed with a few Pelargoniums, Calceolarias, Lobelias, &c., in the same manner as is done in the herbaceous borders to be met with in many kitchen gardens.

During the past and present months, the following species and varieties would render good returns:—*Aster albus*, *A. Amellus*, *A. multiflorus*, *A. pyrenæus*, *A. besarabicus*; *Anemone japonica*, the rose-coloured flower, and the white variety, *Honorine Jobert*; *Gaillardia grandiflora*, *Helianthus* (*Sunflower*) *multiflorus*, *Aconitum autumnale*, *Lobelia cardinalis*, *Phygelius capensis*, *Phloxes*, *Antirrhinums*, *Sedum spectabile*, *Lupinus polyphyllus*, *Pentstemons*, *Ilacanthus candicans*, *Galegas*, *Scabiosa suaveolens*, *Rudbeckia Neumannii*, *Lilies tigrinum* and *speciosum*. All plants needing support should be carefully secured, keeping the sticks and ties well out of sight, and remove flowers past their best, and decayed stems, and leaves.

CARNATIONS.—Here, I never put up layered border Carnations, or winter them in cold pits and frames, but I usually plant the layers direct from the mother plants early in the present month, the ground being previously manured and dug, and well broken down, treading it over evenly, and top-dressed with soot and wood-ashes, which are scratched in with a rake when the levelling is done. Soot and wood-ashes protect the plants from their chief enemy, wire-worms, and also some kinds of grubs, which feed on the roots. The plants, taken up with nice balls, are planted 1 foot apart, letting them down as low as the "grass," and making the soil firm about them. If a dressing of wood or sifted coal-ashes be laid on between the plants and rows, to the thickness of about 2 inches, frost will not readily reach the roots.

CUTTINGS OF CALCEOLARIAS, ETC.—The required number of Calceolaria, Gnaphalium, and Leucophyton Brownii cuttings should be now made and put in, in the manner advised in the *Gardeners' Chronicle*, Sept. 19, p. 339. Many persons fail to propagate Leucophyton, because they place the cuttings in heat instead of dibbling them into sandy soil in a cold frame, as they would Calceolarias, affording the same sort of after-treatment. Leuco-

phyton is almost hardy, and very little protection is required by the young plants in frosty weather.

BEDDING PLANTS AND SPECIMEN PELARGONIUMS.—All recently-struck bedding plants, as well as specimen Pelargoniums, &c., should be got under cover. Pelargoniums and store pots of *Ageratum*, *Lobelia*, *Verbena*, and such like, will winter very well in a light house from which frost and damp can be excluded, the soil in the pots being kept on the dry side. *Alternantheras* and *Mesembryanthemums* require to be wintered in mild heat, and very near to the light. *H. W. Ward, Longford Castle, Salisbury.*

PLANTS UNDER GLASS.

THE BELLADONNA LILY.—It is seldom that this fine autumn-flowering plant is seen in gardens at the present time, and when it is met with, it is usually in the herbaceous borders, and rarely flourishing. The best place for the plant is at the foot of a south or south-west wall in rich sandy soil. If the soil be heavy, a trench should be dug 18 inches deep and 2 feet wide, and having cleared out the crumbs of soil, place 6 inches of rough drainage, and above this freshly-cut turves, and fill up the space with sandy compost. In planting, place the bulbs 3 inches below the surface, with a handful of clean sand under each.

From the middle of the month of February to the beginning of March, is the best period for planting and shifting the Belladonna Lily. During the growing season a good supply of water at the root is of service, and in dry weather a mulch of half-rotted dung. Last spring I divided a bed which had not been disturbed for a great number of years, and after selecting the best bulbs, planted them in the way above described, in front of a Peach-case, 120 feet in length. These bulbs have given us a magnificent supply of their delicate flowers during the past three weeks.

HERBACEOUS CALCEOLARIAS in small pots should now be shifted into larger pots, so as to avoid any check to growth. A good compost for these plants consists of two parts good loam, and one each of leaf-mould and finely-sifted decayed cow manure, and sand in proportion. Place the plants where they will get full light, and near to the glass in a cold house or pit. Fumigate the structure occasionally to keep the plants clean.

PRIMULAS.—These will now require to be taken into drier quarters, as if left out in cold frames, there will be danger of them getting injured by damp. A disused Melon or Cucumber-house is a suitable place for these plants during winter, keeping them well to the light. Plants which are throwing up their flowers should have clear manure-water afforded them once a week.

STOCKS AND SCHIZANTHUS.—The present is a suitable time to make a sowing of intermediate and East Lothian stocks, which are very useful for cutting and for house decoration; make, likewise, a good sowing of those lovely annuals, *Schizanthus pinnatus* and *S. retusus*, for furnishing the conservatory and greenhouse during the spring months. Sow the seeds in a 48-pot, and place in a cold frame till there is danger from a frost, when they ought to be removed to a pit where the mean temperature may be kept from 45° to 50°, standing the plants near the glass to prevent drawing. Thin out the seedlings when large enough to four or five in a pot, shift the potful of plants into larger pots early in the spring, employing a potting compost of two parts loam and one each of rotted manure, leaf-mould, and sand in proportion.

VOILETS.—Those which are intended to be grown in frames during the winter should be lifted without further delay. In doing this, preserve as many of the roots as possible, and place the frames in which they are to be grown in a sheltered spot, but where the sun shines from morning till evening. After planting, finish off with a dressing of fresh wood ashes and soot. Keep close for three or four days, and afterwards give abundance of air on favourable occasions.

BULBS.—Another batch of Hyacinths, Tulips, &c., should be potted; also early-flowering Lilies when obtainable, it not being good practice to keep these bulbs out of the soil for long periods. These early Lilies will be found very valuable in spring decoration, especially those of *L. longiflorum*. *R. Milner, Peirce Castle, Swansea.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY	Oct. 6	{ Committee Meeting: Conference on Michaelmas Daisies and Perennial Sunflowers, at the Royal Horticultural Society's Gardens at Chiswick, at 11 A.M.
WEDNESDAY	Oct. 7	{ Conference on Conifers, at the Royal Horticultural Society's Gardens at Chiswick.
THURSDAY	Oct. 8	{ Resumption of Conifer Conference, at the Royal Horticultural Society's Gardens, Chiswick.

SHOW.

THURSDAY	Oct. 8	{ Crystal Palace Great Fruit Show (three days.)
----------	--------	---

SALES.

MONDAY	Oct. 5	{ Dutch Bulbs, at Stevens' Rooms. Nursery Stock, at The Nurseries, Sunningdale, Berks, by Messrs. Protheroe & Morris (six days). Dutch Bulbs at Protheroe & Morris' Rooms.
TUESDAY	Oct. 6	{ Nursery Stock, at 2, Bedford Road, Green Street, Enfield Highway, by Messrs. Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY	Oct. 7	{ Dutch Bulbs at Stevens' Rooms. Clearance Sale of Greenhouse Plants, Lights, and Piping, at Nursery Farm Lane, Wilham Green, S.W., by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms.
THURSDAY	Oct. 8	{ Valuable Imported Orchids, from Messrs. E. Sander & Co., at Stevens' Rooms. Annual Sale of young Nursery Stock, at Wood Lane Nursery, Isleworth, by Protheroe & Morris. Greenhouse Plants, Lease, Boilers, and other Fittings, at Nursery, Beaumont Road, Leyton, by Protheroe & Morris.
FRIDAY	Oct. 9	{ Nursery Stock, at High Broom Nursery, Tunbridge Wells, by Protheroe & Morris. Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY	Oct. 10	{ Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—53° I.

Should the weather continue as propitious as it is at the moment of writing, the success of the Chiswick Conferences next week will be assured. We are obliged to write in the conditional, for past experience has shown not only the uncertainty of the weather, but also that the attendance at some of the best and most interesting exhibitions and congresses there has been scanty. On the other hand, on many

occasions, notably at the Apple Conference, the number of visitors has been large, and in nearly all cases larger than in the Drill Hall.

Let us hope that bright weather, and an interesting programme, will secure a large company. Those who visit the garden, hallowed by so many associations, though bereft of more than half its former area, will note with pleasure signs that the evil days of the Society have passed with the end of the Kensington régime; and that, thanks to the devotion of the Council, and specially of its officers for the last two or three years, a manifest improvement is visible. The traces of the lamentable neglect of former years, which we should qualify as shameful did we not know the circumstances, are disappearing under the more liberal expenditure which the finances now render possible, and although a great deal remains to be done, a great deal has been accomplished.

A generally abundant fruit crop will enable visitors to inspect a well-filled fruit-room, and to compare notes on the ground and in the vineries. Messrs. MAYFARTH'S apparatus for the drying of fruits, to which we have frequently referred, will be shown in action, and will indicate one way in which surplus fruit may, in such a season as this, profitably be dealt with. For Apples of most kinds, the apparatus seems quite successful; but so far as Plums are concerned, the same amount of success has not hitherto been attained, probably because we do not yet know the kind of Plum best suited for the purpose. So far, the Fellenberg has proved the most suitable, and some that we had the opportunity of tasting a few days since, were very good imitations of French Prunes.

The collections of Michaelmas Daisies and of perennial Sunflowers will be at their best. As many readers will remember, a large collection of species of both genera has been grown this season at Chiswick, and a nomenclature committee has carefully examined the plants, during growth, with a view of ascertaining the correct names, abolishing useless synonyms, and of noting which kinds are the most attractive for garden purposes. Aster is one of those genera in which the limits of species, as generally understood, are even less distinctly marked than usual. We have a crowd of forms, merging by almost imperceptible gradations one into the other, so that none shall say (with any regard for his own reputation), "Here endeth species A," or, "Here beginneth species B." Nevertheless, in spite of these little difficulties, which do but form an agreeable pastime for systematic botanists! it is easy to pick out from the main crop a few which are remarkable above their fellows, for their beauty of colour, their freedom of flowering, their tall, or their dwarf stature, their earlier, or their later period of blooming, and so on. These forms have accordingly been noted, and names affixed to them, so that the lovers of herbaceous perennials in the future will have some authenticated evidence before them when making their selections. The Fellows of the Society owe not a little to the members of the committees, who without fee or reward other than a pleasant sense of duty fulfilled, devote so much time to the Society's work. At a subsequent period we shall be in a position to publish a complete list of the more desirable kinds of Aster and Sunflower; in the meantime we may mention, among Helianthus, H. orgyalis, the most graceful of all in its foliage; the large-flowered varieties of H. multiflorus, the Soleil d'Or, or improved double form of the same species; the citron-yellow,

H. decapetalus, H. rigidus, Heliopsis laevis, with rich orange flowers, &c.

Among dwarf Asters, none are better than A. Amellus bessarabicus and acris. Later on come various forms of diffusus, such as horizontalis, multiflorus, and many others. Of taller-growing varieties, the form of Aster Novi Belgii, known as Robert Parker (lilac); the variety of A. Novae Angliae, called puniceus pulcherrimus (white); and A. Novae Angliae roseus, are most remarkable. Aster Linosyris, a yellow-flowering species, native in some parts of Britain, is remarkable for the contrast it affords to the other species, which range from white to bluish, and to rosy-lilac. In the determination of these species, the committee has had the advantage of the co-operation of Mr. DEWAR, who has a large collection under his charge at Kew. The Conference on these plants will be held on Tuesday next, beginning at 2 P.M.

On the two following days it will be the turn of the Conifers, and a most interesting exhibition will, in all probability, be got together. In the first place, a special area, 150 feet long by 37 feet in width, will be specially laid out for their reception, and Messrs. VEITCH, JEFFRIES, CUTBUSH, and others, have announced their intention of taking part. The specimens of cut branches with cones, for which special prizes, —including a Veitch Medal—are offered, will also, presumably, be very numerous and interesting, as applications have been made to Her Majesty the QUEEN to send specimens from Balmoral and Osborne; while the leading Scottish, Irish, and English Conifer-growers have been solicited to take part in the exhibition. From Kew upwards of 300 specimens are to be exhibited. In Scotland, the services of our excellent correspondent, Mr. MALCOLM DUNN, have been enlisted; and from the details given in another column it is seen that a representative collection from the various counties will be forthcoming. Bearing in mind the vast importance and the great interest of the subject, both from an economic and from an æsthetic point of view, we can but hope that the English growers will be as well represented as the Scotch.

ROYAL HORTICULTURAL SOCIETY.—The next meetings of the Floral, Fruit, and Orchid Committees will be held in the Gardens, at Chiswick, on October 6, at 11 A.M.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the committee took place on the 28th ult., at Anderton's Hotel, Fleet Street, Mr. E. C. JUKES in the chair, the attendance being, as usual, large. The matter of providing a new design for the Society's Certificate of Merit was referred to the Schedule sub-Committee, with instructions to select one, and issue the Certificate without delay. The Secretary reported it had been definitely arranged that the Conference on Chrysanthemum sports in connection with the November show, would take place in the Board Room at the Royal Aquarium, at 6 P.M., on the 10th, the opening day. The special awards recommended by the judges at the early Chrysanthemum show were approved by the meeting. On the application of the Market Harborough Chrysanthemum Society, Messrs. J. WRIGHT, of the Temple, and W. THEOBALD, of Highgate, were nominated as judges at the Chrysanthemum show at Market Harborough on November 11. An interim financial statement was made by the Secretary, of a satisfactory character. The Secretary was empowered to make the necessary arrangements for the November show. Eight new members were elected. The usual vote of thanks to the Chairman closed the proceedings.

THE PROSPECTS OF THE POTATO CROP.—As I have just returned from a ten days' trip to Scotland that I took for the purpose of applying the

FIG. 42.—*ABIES WEBBIANA*. SHOOT AND CONES, NATURAL SIZE; LEAVES, DEEP GREEN ABOVE, SILVERY BENEATH; CONES, PURPLE. (SEE P. 395.)

Bordeaux Mixture, with a view to seeing how far one dressing would stay the progress of the disease in that country, you may be interested in hearing of the crop. I occupied my whole time at looking at Potatoes round Dunbar, Edinburgh, Dundee, and Arbroath, and from what I saw, unless the crop is damaged by blight which was only just showing in places, the crop will be an immense one. Upon one farm the crop upon 300 acres will not be far short of 4000 tons. Several large fields I looked at will turn out 10 and 12 tons to the acre. I daresay, as I was introduced to the farmers by the editor of the *North British Agriculturist*, they were among the best in Scotland; but I went over a number besides, and in all cases the crop was good, and in driving about the country one could not fail to notice the flourishing appearance of the bine, and upon examining the bottoms, all the promise of the top was carried out. In my opinion the Scotch have a grand crop once more; they certainly deserve it upon the best farms, for their system of culture would be difficult to improve upon, it is so suited to local requirements of climate, soil, &c. On the 21st. I examined the R.A.S. experiment with the Bordeaux mixture, and found the bine of 2 acres of Regents dressed with the 2 per cent. solution three times, still green and growing. This was at Sittingbourne, in Kent; the farm is at Milton, 1 mile from the station, and well worth anyone's time to see. The land is most highly cultivated, so the disease has had every chance. *Wm. Whithead Cousins, South Row, Covent Garden Market, in Agricultural Gazette, September 28.*

BEGONIAS AT TRING PARK.—The tuberous Begonias seem to have done well as bedding plants this wet season, and one of the best effects we have seen is in the Night Hon. Lord ROTHSCHILD'S garden at Tring Park. In one of the many garden nooks there, the rising background planted with handsome Conifers, fronted by charmingly-arranged flowers, among which the Lilies, Gladioli, and many showy annual and perennial and scented plants, such as Lavender bushes, are conspicuous, and the whole edged with *Abies pumila*; the middle of the grass-plot is arranged as a geometrical garden. The centre is chiefly of Clematis, with some side beds of Violas. The radiating beds alternate rich dark scarlet Begonias, edged with *Centaurea*; dark Heliotrope, edged with blue *Lobelia*; and silver variegated *Pelargonium*, with a band of dark *Iresine*, edged with yellow *Pyrethrum*. Around, at a proper distance to render the whole effective, are circular beds, in which the centres are occupied by noble standard clipped Golden Yews and Golden Queen Hollies, the beds beneath them being planted with suitable flowers. One bed of large yellow Begonias, with a band of *Iresine* and edging of *Centaurea*, is very effective. Only decided colours of Begonias are grown at Tring Park (chiefly rich dark scarlet and yellow), and the manner in which Mr. E. HILL, the gardener there, works them, is worthy of note. They are grown from home-raised selected seeds, and as such vary too much to be indiscriminately planted. Where they are wanted to make an effect among other things, they are planted out the first year in trial beds, from which all of the proper colour and uniform habit are marked, and the marked ones only are started at the proper time, and planted as they now appear in the effective arrangement alluded to above.

VEGETABLE AND FRUIT CULTURE CLASSES.—Arrangements have been made for holding classes for the study of the principles and practice of horticulture in the Grosvenor Museum, Chester. The botanical instruction will be delivered by Mr. J. D. SIDDALE; practical demonstrations in pruning, grafting, planting, packing, storing; also lectures on general culture will be given by Mr. JOHN TAYLOR, Hoole Hall Gardens; diseases of crops will be treated by Mr. R. NEWSREAD, Curator of the Museum. It is intended to illustrate the lectures by lantern pictures, microscopes, and to utilise the excellent life histories of injurious insects now in the museum

there. These classes should prove useful to the numerous young gardeners in the local nurseries and private gardens.

THE HYGIENIC VALUE OF THE ATMOSPHERE IN WOODS AND FORESTS.—The *Biedermann's Centralblatt für Agricultur-Chemie* has recently expressed an adverse opinion on the theory which attributes the healthiness of living near woods and forests to the richness of the atmosphere in oxygen. It states that the atmosphere in the neighbourhood of trees does not contain any excess of oxygen, as is commonly presumed, and states that this will not be surprising if it be remembered what a great difference exists between the consumption of oxygen by animal-life, and the exhalation of this gas by the life-processes of plant-life. The writer calculates that a few people living in about an acre of woodland will more than compensate for the oxygen given off by the trees. If this be true, and the writer vouches for it, the healthiness of well-wooded districts must be attributed to the greater purity of the air in such districts. In a wood there is no smoke, no sewage, no noxious vapours due to human civilisation, and very few of the germs and bacteria which are found in towns. Moreover, it has been shown by LERASINI and ARATA that the innumerable leaves and twigs of a wood exercise what may be termed a filtering action upon the air, and tend to collect and retain floating particles and micro-organisms carried thither by the air-currents. Besides this, trees break the inclemency of cold dry winds, which are so dangerous to the respiratory organs, and tend to keep the temperature of the soil uniform. To this it must be added, that in country districts especially, if they are well-wooded, there is more natural ozone than there is elsewhere (there is probably none in crowded towns), and the action of ozone is itself salutary.

TABLE DECORATIONS IN RUSSIA.—Russians, who are very fond of flowers, do not relish a repast when the table is not one mass of fragrant blossoms, and nowhere else in Europe does one see such gorgeous table decorations as in St. Petersburg or Moscow. Large sums of money are often spent for rare Orchids to adorn the board of some wealthy entertainer; and at the dinner given some time ago by Prince NARISKINE to the Diplomatic Corps at St. Petersburg, the flowers in the dining-hall cost over 20,000 roubles.

CHISWICK GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The annual general meeting for the election of officers and committee for the ensuing year, and other business, will be held at the Royal Horticultural Society's gardens, on Friday evening, October 2, at 8 o'clock. The committee have decided to hold a concert during October, in aid of the Gardeners' Orphan Fund, further particulars regarding which will be announced at the annual meeting.

AUSTRALIAN FRUIT IMPORTATIONS.—The probability of large shipments of fruit to this country being made from our Australian colonies in the early future, the practicability of which has been so recently demonstrated by the great quantities of excellent Tasmanian Apples with which our markets have this year been supplied, is now further exemplified by the arrival, this week, of a small consignment of Raisins from the Australian Irrigation Colonies on the River Murray, being the first fruits received from these settlements, the establishment of which, some three or four years ago, has been attended with such remarkable success that their progress has been described by a colonial bishop who recently visited them (Dr. THORNTON, of Ballarat), as simply "amazing." A quantity of Raisins are now on view at the London Offices of the Australian Irrigation Colonies, 35, Queen Victoria Street, E.C. They are entirely sun-dried—the clear dry atmosphere of that part of Australia where the settlements are situated enabling the drying of all descriptions of fruit to be carried out in the most perfect manner and without risk of injury. They have been pronounced of excellent quality, both

in flavour and appearance, and are very attractively put up in 2-lb., 6-lb., and 12-lb. boxes. The above consignment will, in due course, be followed by others of a no less interesting character, embracing the following valuable fruits of commerce:—Oranges, Lemons, Raisins, Currants, Apricots, Peaches, Figs, &c., together with wine, olive oil, and other products, for which a large demand is anticipated in this country in future years. The total area of land constituting the Australian Irrigation Colonies, and of which some 25,000 acres at each of the two settlements (Mildura and Renmark) are now being dealt with, will fall but little short of half a million acres; and although the colonial demand will probably absorb the entire production for some years—there being at present a large importation of these fruits, &c., into Australia from foreign countries—an extended reciprocal trade with the mother country will be early cultivated (more especially with reference to wine, olive oil, &c.), in view of the enormous future production which is confidently anticipated and practically assured.

CHICAGO EXHIBITION.—Mr. J. M. SAMUELS, a nurseryman of Clinton, West Kentucky, is the chief of the Bureau of Horticulture. Mr. J. M. THORPE has been appointed chief of the division of Floriculture.

HYACINTHUS CANDICANS.—The hardiness of this species is beyond doubt, and several other correspondents have written to us to that effect from very different parts of the country. It would seem that the bulbs will not withstand the digging-up and drying method pursued with many other kinds of bulbs, and that if they are dug up when matured, they must be replanted without much delay. Mr. J. Pounsett says that the plant seeds quite freely, and can be raised easily from seed, which will only germinate well the first year, so that any other mode of propagation seems superfluous. Though a native of South Africa, the *Hyacinthus* appears not to have been affected by the late cold wet season, fine spikes of 5½ feet in height being plentiful where the soil was light and rich.

FIGUS REPENS.—Mr. W. FANMER, of Kylemore Castle Gardens, Galway, sends us a fruit of this species with the large leathery leaves which it bears in the fruiting stage, or when away from the wall, and which form so remarkable a contrast with the small papery-leaves of the plant when grown against a wall. The two forms were figured in our columns at p. 51 and p. 53, for January 10, 1891.

STRIPED BEGONIA TUBEROSA BLOSSOMS.—We are indebted to the kindness of Mr. ERNST BENARY for some blossoms of a novelty in tuberous Begonias. These are of various ground colours, as crimson-orange, pink, and others, which are striped, and flaked after the manner of a Carnation, and mostly with whitish-yellow, or the variegation is suffused with the ground colour. A striped Begonia is a novelty that will find favour with those who object to the glaring colour of the selfs.

THE CULTIVATION OF THE DATE IN PERSIA.—Referring to the Date cultivation in Persia, the Consul at Teheran, in a report to the Foreign Office, says:—"The capabilities of the Lower Karun lands for Date cultivation are great, and are sure to attract planters soon. The Date supply keeps increasing year by year, and so does the demand; 60,000 tons were exported last season from Busrah in ocean steamers and coasting craft; 20,000 tons being sent out in boxes, the material for which, in the form of 7,000 tons of cut lengths of wood, with nails, oiled paper for inside wrapping, and iron hooping for outside binding, all prepared for easy putting together, was imported from England and elsewhere. The Palm-leaf itself formed woven bag and basket package coverings for 40,000 tons. An acre of ground contains 600 trees; they bear fruit at five years, and reach full fruition at seven. In a fairly good season, a tree in full bearing gives an average profit of 3 rupees, at which rate the acre would return £20 a-year. While the trees are growing up, the ground,

with the irrigation which they require, yields a crop of Wheat, Clover, or grass, and later can be managed to afford pasture, there being but little heavy shade thrown by the feathery foliage above. It is stated that 160 varieties of Dates are distinguishable by the native growers in these Palm districts. The Arabs pay close attention to conditions of climate, soil, water, &c., so as to cultivate the Date to the best advantage. The Government are encouraging the Date cultivation, and it is said that 60,000 trees have recently been planted on Persian soil.

"BULLETIN DE LA SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES"—An interesting record of the proceedings of a Society of French gardeners, mostly resident in or about London; meetings are held at intervals, which must be very useful and instructive, and means are adopted whereby French gardeners may be placed in English establishments, and English gardeners in corresponding situations in France. The papers printed in the present *Bulletin* are mostly excellent, and show how much our young French friends have profited by their stay here.

THE FÊTE OF ST. FIACRE.—The *Moniteur de l'Horticulture* gives a report of this fête, presided over by M. HENRI DE VILMOISIN, supported by the Archbishop of Paris. There are, it appears, more than 700 members of this philanthropic association, 242 of whom assembled at the banquet.

CHEAP FRUIT RATES.—Mr. W. PARLOW, in the *Star*, September 26, says:—I was much grieved, as will be many other of your readers, on seeing the paragraph in your issue of the 21st, stating that—"Owing to the glut of Plums in Kent, many growers will not pick hundreds of bushels, as the expenses come to more than the price obtainable at the London market." It is pitiful that there should be such waste of good and wholesome food, which could be largely obviated by the railway companies if they would carry fruit at lower rates. Allow me to suggest that the companies should make a special reduction in their charges for conveyance of fruit during the fruit season, or at least during the month or two of most abundant production. This, I think, will prove an advantage both to consumer and producer, and be more remunerative to the companies through an increase in traffic, as at present large supplies are being held back.

THE ADVANTAGES OF COW MANURE.—A foreign contemporary describes the liquid that runs from manure-heaps during any rain as so much "liquid gold," and recommends that properly-protected receptacles should be used for all manures. It calls attention to that too-often neglected source of fertility, the droppings from the poultry-houses, and states that this manure is often equal in value to the finest guano. Cow-dung comes in for a share of praise. It is estimated that fully 80 per cent. of the manurial elements in the food consumed by cows is voided in their excrement. Dr. COLLIER, an American expert, states that in his experiments, which were carried on over a considerable length of time, fully 90 per cent. of all the fertilising constituents of the food consumed by cows was voided, and that this should be used to preserve the soil's fertility. He found that at the usual prices for commercial fertilisers, the amount of plant-food in the daily excrement (liquid and solid) of well-fed cows was worth over ten cents, or 36 dols. a year (1 dol. = 4s. 2d.), and since the daily food of these cows cost 14½ cents per head, nearly three-fourths of the cost of the food was returned again in the manure.

THE CHEMICAL CHANGES WHICH ACCOMPANY THE DEVELOPMENT OF THE POTATO.—*Biedermann's Centralblatt* contains a short paper by MARCACCIO upon the conversion products of starch which take place during the growth of the Potato. It seems that Potato-starch, even in quite ripe Potatoes, becomes converted into cane-sugar; and Barley and Wheat grains, in germinating, double the amount of

cane-sugar at the expense of the starch they originally contained. Samples of Potato meal and finely-cut Potatoes were dried, some in the sun and some in an oven at 45° C., and in both cases an increase of cane-sugar was observed. In germination, the Potato, like the Barley-grain, gains cane-sugar through the conversion of the starch; finally, the cane-sugar breaks down into glucose, or grape-sugar.

BONE-MEAL MANURES.—In a paper published in the *Chemiker Zeitung*, J. STOCKLASE gives the results of an examination into the composition of bone-meal; he analysed various samples prepared by different methods. Sufficient care does not appear to be exercised in the preparation of this valuable manure; sometimes the fat is not properly removed, and this impedes the decomposition in the soil, both of the nitrogenous matter and the phosphate of lime. Steaming is not an altogether commendable process, for it seems that when the pressure is sufficiently great to remove fat, a great deal of the nitrogen, a valuable constituent, also goes. STOCKLASE advocates the extraction of the fat by means of treatment with light petroleum. He regards finely pulverised bone-meal deprived of fat as an excellent manure, superior to basic slag, and not even second to precipitated phosphate in action.

THE "RESPIRATION" OF CACTUS PLANTS.—Cactæ, when exposed to light of moderate intensity, at a temperature of 35° C., = 95° F., give off oxygen and carbonic acid gases simultaneously, their respiration ratio being from 0.98 in the case of *Opuntia* to 0.88 in the case of *Mamillaria*, while their assimilation ratios vary from 2.38 to 2.28. This phenomenon has been recently investigated by E. AUBERT, and from the results of his experiments, he has come to the conclusion that it is due to the fact, that the thin chlorophyllian layer is not able to decompose the whole of the carbonic acid gas evolved by respiration from the colourless parenchyma underneath. The intense light of the tropics decomposes the whole of the carbonic anhydride, and in the tropics the loss of carbon takes place only during the night.

JARRAH WOOD IN CHURCH BUILDING.—The application of foreign woods in English church buildings is essentially an innovation of this latter part of the nineteenth century. In old English ecclesiastical buildings, we naturally look for the timber work, whether constructive or ornamental, to be formed of Oak. The wood seems specially adapted for the purpose, and from its association, to have become like the ancient churches themselves, almost hallowed in its use; but we are, apparently, about to change all this, and the latter half of this progressive century will be recorded in future history by the introduction of timber that will probably puzzle the archæologists of future ages. On the authority of *The Church Times*, we learn that in the recent restorations of one of the most interesting of Kentish churches, namely that of Herne, situated on the road between Canterbury and Herne Bay, and about 2 miles from the last-named watering place, the bays between the principal and intermediate rafters have been filled in with boarding and finished with mouldings, the spandrels being richly carved; the whole of the woodwork of the new roof being of Jarrah wood (*Eucalyptus marginata*) from Western Australia.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER.—An exhibition of hardy and other fruits will be held in the Town Hall, Manchester, on the 20th, 21st, 22nd, and 23rd of the present month; and on the 21st and 22nd a Conference will take place in the Town Hall, at 12 o'clock each day. On the first day of the Conference, the Right Hon. the Earl of DERBY will preside, and on the second day, Alderman Sir JAMES WHITEHEAD, Bart., Master of the Fruiterers' Company. The following subjects will be introduced by the gentlemen whose names are appended:—Mr. BAILLIE, of Chester, "The Fruit-growing Movement: Present Day Features and Prospects;" Mr. CHEAL, of Crawley, Sussex, "The Condition, Preparation, and

After-treatment of the Soil for Fruit Culture;" Mr. S. T. WRIGHT, of Hereford, "Fruit Growing for Profit;" Mr. CRUMP, of Madresfield, "The Raising, Budding, Grafting, and Pruning of Apple Trees for Orchard and Estate Planting;" Mr. T. F. RIVERS, of Sawbridgeworth, "Orchard-house Culture;" Mr. EDWARD LUCKHURST, of Romford, "The Importance of Early Planting and Shelter in Fruit Culture."

PUBLICATION RECEIVED.—THORLEY'S *Illustrated Farmers' Almanack and Diary for 1892*.

"CATTLEYA LABIATA VERA."

M. LUCIEN LINDEN sends us a letter of eight quarto pages in length, relating to this subject, and considers that he has an uncontested right to demand its insertion. Although we cannot admit the right, we should have been pleased, as a matter of courtesy, to admit M. Linden's communication if it had been of reasonable length. M. Linden is probably not aware that over forty columns of printed matter were "squeezed out" of our last issue, for which place has to be found in this, in addition to the constant influx of fresh "copy." Under these circumstances, we must confine ourselves to giving a summary of M. Linden's communication, leaving him to print the letter, as he proposes, in full in his *Journal des Orchidées*.

M. Linden begins by the statement that his father, the eminent botanical traveller, had known for a long time that a very remarkable species of *Cattleya* grew in one of the provinces of Brazil. In December, 1889, MM. Linden sent their collector, M. BUNGEROTH, to that province, charged with the duty of collecting several thousand specimens of the plant. In April, 1890, the first batch arrived in Brussels, in good condition. Among them were a dozen which had opened their flowers during the voyage. These were different from those which flowered subsequently in October, and which latter were recognised as *Cattleya labiata autumnalis*. On November 9, at the meeting of the *Orchidienne*, the old type of the species was exhibited, and the jury, on that occasion, were unanimously of opinion that there was no difference between these two plants and the *Cattleya Waroqueeana* exhibited by M. Linden except that some of the varieties of *Waroqueana* had a deeper coloured lip. Mr. O'BRIEN, who had formed one of the jury on the occasion referred to, expressed the same opinion in the *Gardeners' Chronicle* of November 15, 1890. On November 10, M. Jules HYE, of Ghent, sent to M. Linden a flower of *C. labiata autumnalis*, which he had procured at the sale of Mr. Tautz's Orchids. There was no difference between this flower and the majority of those which were expanded in M. Linden's collection at the Horticulture Internationale. On October 22, 1890, Mr. O'BRIEN wrote to M. Linden in the following terms:—"It appears to me that this is autumn-flowering *labiata* of which our old *C. labiata autumnalis* is but the sample; this is the bulk." On the occasion of his visit to the Horticulture Internationale about a fortnight ago, Sir Trevor LAWRENCE stated that he had immediately recognised that *C. Waroqueeana* was the true *labiata autumnalis*. Mr. STATTER, of Manchester, has expressed the same opinion. In November, Messrs. LINDEN sold, at Messrs. PROTHEROE & MORRIS' rooms, a number of the plants under the name of *labiata autumnalis*. Some who were present declared that these plants were merely forms of *Gaskelliana*. Mr. LINDEN replied to these opinions in the December number of the *Journal des Orchidées*. It was, therefore, not in last February, as Mr. Rolfe asserts, but in the preceding November, that the identity of the two *Cattleyas* was established. There are at the present moment in the Orchid-houses of the Horticulture Internationale more than 2000 spathes; supposing that each gives two or three flowers, there will be produced from now to January some 5000 or 6000 flowers. This magnificent crop, the second since the introduction, will be conclusive.

This is the substance of M. Linden's letter; some of the omitted portions are purely of a personal and commercial character, unsuited for the editorial columns.

PLANT NOTES.

TROPEOLUM PENTAPHYLLUM.

THE Chili five-leaved *Tropeolum* deserves more extended cultivation, and may be grown wherever the ordinary and more commonly-grown *T. peregrinum* (canariense) succeeds. The former, as is well-known, is an annual, and both succeed well in light, warm soils, especially in such as are of a calcareous nature, and in sunny positions. *T. pentaphyllum*, it scarcely need be said, is tuberous-rooted, hence the treatment

it requires varies considerably from the above. For growing over trellis-work, or attached in form of handles to artificial basket-summer flower-beds, it has no equal; especially when such handles are of moderate thicknesses, so that the fine growth and vivid blooms show their characteristics. It is also well-adapted for covering iron pillars, sunny walls, &c., in like manner. To succeed with it, however, the tubers should be started into growth betimes, then grown on slowly, but robustly, in small pots, in airy pits, until about the first week in June, when they should be planted out for the summer growth in full sunshine, and such soil as has been suggested.

William Early.

CALCEOLARIA PINNATA.

This plant is an annual one, coming freely from seed sown in the open ground in April, and making a good effect by the end of the month of May, and is then fit to plant out in the beds which it soon fills. The plant may be kept low by being pegged down, or it may be allowed to grow naturally, when it will reach a height of about 2½ feet. It blooms all through the summer and autumn, and is not liable to disease of any sort. It would make a good bedding-out plant, and prevent the disappointment that is too often experienced with the shrubby kinds of Calceolarias dying off with black-stem disease in hot weather. Wm. Smythe.

CELSIA CRETICA.

This pretty greenhouse-plant, sometimes called *Verbascum*, flowered last May and June, and plants of it are again in full bloom. They are very showy and beautiful when arranged with other plants, and its fine spikes of yellow flowers last a long time in good condition. I think no greenhouse or conservatory should be without a few examples of *Celsia cretica*, as it is easily managed if treated in the same manner as herbaceous Calceolarias, and grows freely from seeds sown in light sandy soil, or from cuttings struck under a bell-glass. Wm. Smythe, Basing Park.

CHISWICK NOTES.

SOME borders of Hollyhocks have been very gay at Chiswick this year. One point of importance in reference to this favourite plant is worth noting for the benefit of cultivators. It has been found that plants lifted and housed during winter were affected with the dreaded fungus the following season; whilst those which were not so disturbed (subjected to what may be called natural conditions) presented a clean bill of health. The moral to be deduced from this course of treatment is an obvious one.

BOOK NOTICES.

BUSH FRIENDS IN TASMANIA. By Louisa Anne Meredith. (Macmillan & Co. 4to.)

There are old friends and new, but the older ones usually hold the higher place in our estimation. "Bush friends in Tasmania" are old acquaintances, our good opinion of which has not lessened by lapse of time; but now another batch comes; and, judging by all appearances, they will take no lower place in our regard than their predecessors.

Thirty-three years ago, says the author, I sent to London, for publication, "some of my friends in Tasmania," and the unanimously warm welcome with which the book was greeted both in England and Australia, came like sweetest music into our remote and isolated home. Now, in the late evening of life, when the work of author and artist is usually considered done, I am thankful still to retain some power for the practice of my old pursuits, and for the completion of this second, and certainly last volume, which offers more of my bush friends to the public, and contains plant portraits of yet greater interest and beauty than its predecessor. . . . For a woman nearly eighty years of age to make the voyage from Tasmania to London, bringing a book to publish, was doubtless an exploit of less wisdom than valour; but my purpose is achieved, and I now hope to return and end my days among my children, in the pleasant colony to whose service my best efforts have been so long devoted.

A preface like this seems to imply an appeal for the indulgence of the reviewer. If any such notion actuated the writer, it was in reality wholly uncalled for. We do not know which to admire most, the genial spirit which pervades the whole book, the right-mindedness and sympathy with what is good, beautiful, and true, the pluck of the authoress, or her artistic faculty. There is no straining after effect, either in the text, or in the plates, both of which reflect simply and accurately what was passing before the mind of the author, or what was displayed before her eyes. In twelve large quarto plates the artist has given us a selection from among the most beautiful and interesting plants of Tasmania. Many of them, such as the Acacias, the Correas, the Epacris, the Blandfordias, are well-known inmates of our greenhouses; others were cultivated here in the time of our predecessors, but are rarely seen now. Perhaps Mrs. Meredith's book may do something towards their reintroduction. *Anopterus glandulosa*, a shrub occasionally met with in our conservatories, and always admired, is recommended for trial out-of-doors in the south of England. We should be glad to hear of its being tried; but after the experience of last year, we doubt whether it would survive a "grand winter." The plant has leaves not unlike those of the Portugal Laurel (which, of course, is no Laurel), and the authoress adds, that the *Anopterus* is "well named Laurel, though how, in the usual course of popular colonial nomenclature, it escaped being called a Daisy or a Sunflower, is little short of marvellous." As the plant in question is a Saxifragad, it would be no more incorrect to call it a Daisy than it is to call it a Laurel.

Among the most remarkable of the plants here figured is the *Richea dracophylla*, a plant far more like in superficial appearance to a Bromeliad, than to what it really is, an Epacrid. Like the Waratah (*Telopea*), the *Richea* is in danger of extermination, from the quantities which are every year brought into Hobart. "Not love of beauty, but inconsiderate selfish greed implies such wanton waste."

In addition to the coloured plates, there are series of uncoloured page-plates, called "Poem-titles," because they serve as frontispieces to the numerous tender and graceful little poems with which the work abounds. We are sure the artist will forgive us—may, we think she will sympathise with us, in our preference for these uncoloured representations of plants as gracefully arranged, as accurately drawn, and reproducing the artist's drawing more faithfully than the coloured designs. A word must also be said in praise of Mr. Edward La Trobe Bateman, who has contributed what the authoress calls the quaint lettering to the "Poem-titles." The form given to the letters has been suggested by the outlines of the foliage and branching of the plants represented, and is, if sometimes "quaint," always in harmony with the picture of which it may claim to be part. Sir Joseph Hooker and Professor Westwood have lent their aid in the identification of the plants and insects represented in the volume.

OUR COUNTRY'S FLOWERS AND HOW TO KNOW THEM. By W. J. Gordon. (Day & Son, Berners Street.)

This little book comes before us with a preface by the Rev. Professor Henslow. After giving in the first chapter a list of the popular names of plants, the author plunges into the subject of classification in a chapter which we should fancy must be somewhat appalling to a beginner. In a following chapter the reader is aided by a glossary and a series of coloured plates. In these plates the plants are rather crowded, but they are recognisable, though crude in colouring. Small woodcut outlines are also given, showing the main characteristics of the several genera, and, lastly, the characters in brief of the species. It is evident that much pains and labour have been bestowed on the work; its plan is novel, and its details, so far as we have tested them, accurate.

TILLAGE AND IMPLEMENTS. By Walter J. Malden.

This is one of Messrs. Bell's agricultural series, and is the production of one who has been a farmer from boyhood, who is still a farmer, and who has learnt at the plough-handle most of what he knows about the tilling of the soil. Beginning with the drainage and preparation of the land, the author proceeds to detail the ordinary details of farm work, beginning with the "catch crops," such as *Trifolium incarnatum*, winter Rye, winter Barley, and Tares. Similar directions are given for autumn-sown crops on various descriptions of land for winter-ploughing, spring-seeding, summer-hoeing, Potato-planting, &c. The latter half of this little volume is occupied with descriptions of the various implements and machines used on the farm. The book is unpretending, but full of useful detail. It is published at a low price by Messrs. George Bell & Sons.

SCOTLAND.

THE following is a list of contributors of specimens of Conifers to the Royal Horticultural Society's Conference at Chiswick, October 7 and 8:—

Her Majesty The Queen, Balmoral; Duke of Argyll, Inverary; Duke of Buccleuch, Drumlanrig; Duke of Richmond, Gordon Castle; Marquis of Northampton, Torloisk, Mull; Earl of Mansfield, Seone; Earl of Stair, Castle Kennedy; Earl of Moray, Darnaway; Duke of Sutherland, Dunrobin; Earl of Cromarty, Castle Leod; Countess of Seafield, Cullen; Earl of Aberdeen, Haddo; Lord Kinnaird, Rossie Priory; Earl of Hopetoun, Hopetoun; Sir Jas. H. Gibson Craig, Bart., Riccarton; Sir Pat. K. Murray, Bart., Ochbertyre; Sir Robert Menzies, Bart., Castle Menzies; Sir J. Colquhoun, Bart., Rosdhu; Sir S. M. Lockhart, Bart., Lee Castle; Sir A. G. Cumming, Bart., Altyre; W. H. Maxwell, of Munches; Stuart Fotheringham, of Murtbly; J. Merry, of Belladrum; Mrs. Malcolm Patton, The Cairnies; Hon. H. H. Duncan, of Fordell; J. Malcolm, of Pottalloch; A. Stirling, of Keir; J. Ord Mackenzie, of Dolphintoo; William Gunn, Nutwood, Strathpeffer; T. Graham Young, Durris.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

THE following are the awards made to non-competing exhibitors at the recent International Show in the northern metropolis, which we were unable to publish with the first list, in our issue for September 26:—Silver Medals to Messrs. Dickson & Co., Edinburgh, for a table of miscellaneous plants; The Saralgo Packing Company, California, for an exhibit of sun-dried Californian Prunes; Mr. Curror, Eskbank, for a plant of *Oncidium incurvum*—awarded for good culture; Mr. A. McGregor, for *Saccolabium Blumei majus*—awarded for good culture.

TREES AND SHRUBS.

ACTINIDIA KOLOMICTA.

ONE of the last letters written to us by our greatly-lamented friend, Jean Van Volxem, was a note referring to the appearance of this species in his grounds at Vilvorde. The leaves he spoke of as gorgeous with their lilac spots, such as he had also seen three years previously in the arboretum of M. Lavallée at Segrez. In sunny places it—a hardy tree or shrub—will become a substitute for Bougainvillea. The species is not mentioned in Franchet and Savatier's *Enumeratio*, but is so, according to Van Volxem, in the Japanese *Hondzo zou fou*.

EXOCHORDA ALBERTI.

We are indebted to Mr. George Paul for a specimen of this Rosaceous shrub, which is evidently very nearly allied to *E. grandiflora*, a Chinese species, introduced by Fortune, and well figured in Lavallée's *Arboretum Segregianum*, t. xii.; see *Gardeners' Chronicle*, 1858, p. 925. It differs in its shorter calyx-lobes, and by the stamens, which are said to be twenty-five in number, arranged in five bundles, instead of fifteen in five bundles of three each; in other words, the stamens are originally five in number, but each one divides into five, or three, according to the species.

E. Alberti was discovered in Turkestan by Albert Regel, and was described by his father in 1884, in the *Acta Horti Petropolitani*, viii., p. 696 (1884). A figure may be found at tab. xiii. of the ninth fascicle of the *Descr. Pl. Nov.* It is quite hardy, but as a garden shrub hardly different from *E. grandiflora*. The leaves are thin, membranous, glabrous, obovate, entire, apiculate, tapering at the base into a slender stalk about a quarter the length of the blade. Vernation conduplicate. Stipules none. Flowers in long loose racemes, each flower 3 cent. across, with a green funnel-shaped thick tube, surmounted by five oblong, obtuse, white fimbriate sepals. Petals five white, twice the length of the sepals, spreading suborbicular concave. Stamens fifteen, half the length of the petals, perigynous, inflexed. Anthers white. Carpels five at the bottom of the tube, each with two or one on the pendulous ovule. In this specimen, then the stamens were fifteen in number only.

THUIOPSIS DOLABRATA.

This is one of the most desirable evergreen shrubs, owing to its distinctness and hardiness. Moreover,

and it is one upon which he has been at work during the past three winters.

Mr. Goldring tells us, "The hill you see, and the water, are quite of artificial formation, as the country about Makurpara is entirely flat, except the undulations of the nullahs or water-courses. Under the hill is a rocky grotto, with miniature waterfalls, Ferns, Palms, &c., growing in a natural way, and this place is cool even on the hottest days. The artificial rocks are made to resemble red sandstone, a tone that harmonises well with greenery. Rocks are constructed in groups round the lake, in order to show off to the best advantage the many beautiful climbing plants, which are one of the chief features in Baroda gardens. The bridge is partially festooned with the lovely *Ipomoea vitifolia*, with Vine-like leaves, bronze-purple when young, and pure canary-yellow flowers the size of those of *I. Horsfallii*; it is a plant I hope to see soon in English greenhouses, for though an old plant in herbaria, it does not appear to have been introduced. The bushes in the foreground are of *Ipomoea carnea*, a South American species, I believe, but which has become naturalised

tourists and others who visit Baroda during the winter, when the park looks at its best.

HOME CORRESPONDENCE.

THE WHITE-FLOWERED CENTAUREA NIGRA.—(On August 29) there was a statement in these pages that this plant had been found growing in a field near Stroud, and no one else is reported to have met with it. I may mention that the plant is to be met with in the neighbourhood of Bervie, on the Kincardineshire coast, and I saw it last year for the first time in a collection of wild flowers at the flower show at that place, and on remarking to the Rev. Mr. Brown, parish minister of Bervie, that I had never met with it before, he assured me that it was not uncommon in that neighbourhood, nor were white-flowered plants of *Campanula rotundifolia*. The white *Campanula* I have often found wild, but have not yet found time to explore the Bervie district. I observed from the railway carriage window the *Lithospermum maritimum* growing profusely on the sea beach there (why, Mr. Editor, has such an appropriate name been dropped, for first *Steenhamera*, and now for *Mertensia*?). White-

FIG. 49.—SCENE IN AN INDIAN GARDEN.

it will thrive in or near towns better than most Conifers. Mr. Woodgate, of the Gardens, Perryfield, Oxted, obligingly sends us a photograph, executed by Miss McNiven, of a specimen of regularly pyramidal habit, 20 feet 6 inches in height, and 41 feet in circumference at the base.

AN INDIAN GARDEN.

Our engraving (fig. 49), shows a view in a garden of one of the great native princes of India—H.H. the Gaekwar of Baroda. Were it not for the pagoda-like structure in the distance, and the canopied bridge, one might fancy the view to be taken from an English garden, but the absence of the characteristic luxuriant growth of a tropical garden, the Palms, Cycads, Bamboos, and other noble foliage plants is due to the fact that the garden is only of quite recent formation, it being one of the gardens that the Gaekwar engaged Mr. Goldring of Kew, to lay out,

about Baroda, where you may see it in hedges. It is a shrubby plant, with cordate leaves, and large rose-pink flowers, and only climbs when it has the support of a tree or bush. Without these plants, Indian gardens would lose half their beauty. *Bougainvillea*, *Thunbergia*, *Ipomoea*, *Antigonon*, *Quisqualis*, *Jasminum*, and *Bignonia* are among the finest genera of flowering climbers, while throughout the winter and in the hot season these are rivalled in brilliancy by the many gorgeous flowering trees and shrubs. The dryness of the region is not favourable for the luxuriant growth of such fine foliage plants as one sees in Bombay gardens, but with an ample supply of water one can grow almost any tropical plant."

Besides photographs of the new gardens that are now being made, we have seen some of the public park at Baroda, which is considered to be one of the finest in India, and which under the superintendence of Mr. J. M. Henry (an old Kew man, but now many years a resident in various parts of India), the park has advanced to its present high state of keeping and beauty. It is much admired by the English

flowered plants of the *Campanula glomerata* are common among the blue on the cliffs by the sea at St. Cyrus; indeed the Montrose neighbourhood is very rich in native plants, and in a Pine wood a few miles north are found *Linnaea borealis* and *Goodyera repens* growing very plentifully. *J. Marshall*, *Montrose*, *N.B.*

CAMPANULA PYRAMIDALIS ALBA.—At Chelworth, a village about 14 miles from Ipswich, these plants are often met with in cottage gardens and windows. Some of these pot plants stand in 7-inch pots, and are from 5 to 6 feet in height, with from ten to fifteen spikes of fine white blossoms. Those plants which are growing in 6-inch pots have two and three flower-spikes. This variety of *C. pyramidalis* was introduced to the notice of the villagers a few years since, and has become popular there. Its increase is slow, if side-shoots only are taken, as is the case at Chelworth; but in my earlier days we used to propagate the plants by means of cuttings from the stouter roots, which were placed round the side of a potful of sandy soil. The flower-spikes remain in bloom for fully two months and keep a long time fresh in water. *D.*

NEW PLANTS—The few lines under this heading in this week's issue, by one of our eminent authorities, indicate what beautiful species there are on the "dark continent," only awaiting the collectors' hands, to grace our gardens and houses. The yellow-flowered *Pancratium maritimum*, however, has been heard of before, and, as known, only limited means prevented it ere this from becoming an occupant of our houses. It is satisfactory, however, to learn that at last it is really a sojourner in our land; and lovers of this beautiful family will await with interest Mr. Gumbleton's opinion when he beholds it in bloom. With reference to the white-flowered *Kniphofia*, it would be interesting to learn what relation it bears to that white-flowered variety which grows upon one of the islands near the African coast, and which, however, is not "tall and vigorous growing," as is the variety he mentions. There are many other lovely flowers, natives of this wonderful country, that should be better known to English growers. To many amateurs the mere name of "Africa" conveys visions of tropical heat, as being alone suitable, in which to successfully cultivate any species brought from that continent. To certain classes of plant-life this definition must be applied; but there are, besides, positively hundreds of species, comparatively unknown in these isles, that might be successfully grown by any one possessing a greenhouse; in many instances, a frame will suffice. To illustrate my meaning, see how easily the popular *Vallota* may be cultivated. Again, take the *Ixia*, and, later still, the *Freesia*, now grown everywhere, all of which grow wild in South Africa. Some years ago, the writer had a valuable collection of bulbous plants under his care, a special feature of which were "Cape, and other African species." Owing to facilities afforded, many kinds were collected that are seldom seen in one collection, Disas in colours scarcely dreamt of in this country; and as for *Lachenalias*, the varieties might be counted by the score. In this country the sorts generally known may easily be numbered upon one's fingers; but to my fancy the gem of this family was one sent under the name of *L. orchinoides* (species), a pure white fimbriated form that defies description. What became of it I know not; but whenever I have happened to come across a good *Lachenalia* collection, I have searched in vain for this treasure. I am afraid I have, however, trespassed too much already upon your space to go deeper into the subject as my inclination would lead; but to all amateurs who delight in uncommon greenhouse bulbous flowers, I would strongly advise them to expend an item in some of the "Cape bulbous flowers," such as *Hæmanthus*, *Moræas*, *Rocheas*, *Cypella*, and *Watsonias*, not forgetting just a few bulbs of that charming Cape *Gladiolus*, the variety known as *tristis* (so befitting its name), taking care to secure the true variety. *Pioneer*.

INSECTIVOROUS PLANTS.—As these plants are occupying a conspicuous place in your paper just now, may I draw your readers' attention to the fact that the *Paulownia imperialis* may be classed among them. Last spring I had the opportunity of watching them under glass, and noticed they fed on small Diptera, chiefly consuming the contents of the thorax. I think all plants having glandular trichomes [pairs] would be worth observing in this respect. *B. Piffard*.

DWARF TROPÆOLUM MRS. CLIBRAN.—This variety of *Tropæolum* is an excellent bedder, never exceeding 6 inches, and a profuse bloomer. The flowers are of medium size, and of a rich orange-yellow colour, and the substance so good as to make it calculated to stand wet weather without injury. *W. D.*

HYDRANGEA PANICULATA.—With reference to the question put by "E. W." in the issue of the *Gardeners' Chronicle* of September 5, "Is *Hydrangea paniculata* a hardy plant?" I would like to state my experience. In the summer of 1890, I had a number of plants of this *Hydrangea* which flowered well, but unfortunately got infested with red-spider. In the month of August the blooms were all cut, and the plants—which were in pots—turned out-of-doors, where they stood in an odd corner till the beginning of winter. They were then turned out of the pots, and thrown carelessly into a heap, where they lay till the following spring exposed to all weathers. Everyone knows what a severe winter that of 1890-91 proved to be. Throughout the most part of which the earth attached to the roots of these *Hydrangeas* was frozen hard. In the spring I cut them hard back, freeing the roots from the old soil, and repotted them, placing the pots on the floor of a cool

house facing east, with the result that they soon broke, flowering fairly well during June and July; and not a single plant died. This rather rough experiment convinced me that *Hydrangea paniculata* is one of the hardiest shrubs we now possess. *J. Lowrie*. [It was killed with us in the open border. *Ed.*]

THE WHITE PASSION-FLOWER, CONSTANCE ELLIOT, AND THE VARIEGATED ENGLISH ELM.—Is it quite certain that this charming white-flowered Passion-flower is merely a white variety of the blue *cœrulea*. If so, it is rather singular that it should have proved decidedly more tender with me as well as other correspondents. That the variegated Elm with such a large percentage of white in its leaves should prove less vigorous than the green is only what may be expected. But whether its naturally slow growth and weaker habit arise from any want of hardiness, seems rather doubtful. I wish emphatically to add my testimony to that of other correspondents, as to its extreme grace and beauty, especially in hot dry seasons. *D. T. F.*

BREAKING UP PAN.—I doubt its being of so much use as is supposed, to break up "pan." No tree will go through it except the Oak, but when broken up, unless it is put on the surface, and the fibre, Fern, or heather root from the surface, broken up small, and put down below, it makes no difference, for the pan soon re-settles itself, and "forms" again. No Conifers will grow large when there is yellow pan containing iron, unless they are given space; with space they run on the surface and do very well indeed, except perhaps the two *Sequoias*. But common Spruce is poisoned by the iron. Scotch is not. *Ch. v. D.*

PROLIFICATION OF CARNATIONS.—The enclosed Carnations illustrate a form of proliferation that I have not previously noticed. Is it rare? First of all appeared a good, full, and well-formed flower. After due time the petals were shed. Then I observed what seemed to me a fine fat pod of seed. This I marked and left to mature. Shortly this apparent pod burst, and now another set of petals is manifest. This freak is confined to shoots on one side of the plant only. *G. P.* [Not uncommon, but the second flower is usually raised above the other on a short stalk. *Ed.*]

POISONOUS LEAVES.—On p. 310 of the *Gardeners' Chronicle*, a correspondent reports a serious case of eczema or erysipelas caused by handling a plant of Poison Ivy (*Rhus toxicodendron*). It is a curious fact that many persons can handle these plants with impunity, and are hard to persuade about their effects on others. I have frequently seen the leaves of *Rhus venenata*, an equally poisonous species, exposed for sale in autumn in Covent Garden Market, and very brilliant they are. I was recently informed of a case of poisoning caused by using for ornament the plumes of *Rhus Cotinus*, though, perhaps, my informant was mistaken in the species. Similar effects are still often produced by handling *Primula obconica*, though attention has more than once been called to the danger of it. A lady recently told me that this plant last year cost her more than £50 in doctors, of whom she consulted two or three about her case; but none of them suspected the true cause until she found it out herself by accident. *C. W. Dod, Edge Hall, Malpas.*

THE DOUGLAS FIR.—Is it known that the young shoots of the Pacific slope variety (fast-growing), Douglas, when bruised, give the same smell as the English Sweet Rush. The Colorado, or slow-growing variety, now favoured by English nurserymen as a finer tree, has not this scent, but one which is nearly the same as that of the common Spruce. *Ch. v. D.*

SAVING AND SOWING CONIFER SEED.—Last year, in September, I saved a nice lot of seed from Thuja Lobbii and Cupressus Lawsoniana. It was carefully rubbed out of the husks, and dried in a cool shed. About the middle of October, it was sown, in ordinary cutting boxes, in sandy soil, lightly covering the seed. The boxes were placed in a cold frame for a month, when they were afterwards stood in a vinery, which was kept cool all the winter. The soil was kept moist, and no more. By the middle of June, the seedlings were ready for transplanting, which was done on a border in the kitchen garden, to which, as it was heavy, some sand and rotted leaves were added as a dressing, just to give the plants a start. I put out 500 of the former at the time named this year, which are now nice

little plants, pushing off into a leader; and, by the time they have had another season's growth, they will be useful for either winter decoration of the flower-beds, or for planting in the shrubbery or elsewhere. The Cupressus seedlings, being weaker, I had put into boxes for the first year's growth; and next April they will go into the border along with the Thuja. Of these we raised a thousand, with scarcely any trouble. If the soil were better suited for small seedling Conifers, they would grow much faster; but the natural soil is heavy and retentive, which is all against quick root action, and, without this, it is useless to expect a quick top growth from seedlings, of even such a quick-growing tree as Thuja Lobbii. It is interesting to watch these seedlings grow into trees 10 and 20 feet high, with so small an amount of time and labour expended on them. *E. M.*

IPOMCEA LEARII.—This magnificent stove evergreen twiner can be seen in the finest character in the large tropical house at Bower Ashton, Bristol, the seat of Sir Greville Smythe, Bart. Planted out, it has run up in the roof, and, sending forth its shoots in several directions, blossoms freely, the large blue flowers, with bars of rosy pink radiating from the centre to the circumference, being very conspicuous. Here one sees Mr. Lear's beautiful *Ipomœa* perfectly at home, and its peculiarly striking hue of blue, together with the massiveness of the blossoms, must be seen to be appreciated. The flowers are short-lived, and the colour quickly changes to a pale rose tint; but then they are rapidly produced, and the mass of rich bright blue overpowers any obtrusion of the fading rose colour. This species will also do well, it is said, in a cool greenhouse; but it would be requisite to have the roots kept warm. It is recorded that when Mr. Knight had the Chelsea Nurseries, I. Learii was a great feature there, and a specimen had more than five hundred expanded flowers at one time. Is this superb floral beauty in danger of becoming a neglected plant? *R. D.*

THE TUBEROUS-ROOTED BEGONIAS IN BEDS.—When walking through the flower garden at Bower Ashton, Bristol, on the morning of August 26, after a very wild and stormy night, when the wind raged furiously, and heavy rain fell in torrents, and the colours appeared to be clean washed out of Pelargoniums, Calceolarias, Verbenas, Phlox Drummondii, and other leading bedding plants; the beds of Begonias were fresh, bright, and most effective under the morning sun, which, unhappily, though absolutely necessary, only continued to shine for a brief period. A few of the larger blossoms were a little damaged through beating against each other, but the most erect were clean and unharmed, as if they had passed through a still and not a stormy night. The plants were seedlings, but it is Mr. Bethell's intention to select the best bedding types, plants of compact sturdy habit, with medium-sized flowers freely produced upon stout erect foot stalks, the flowers looking upwards to the sky above them, and not hanging their heads and hiding their faces as if ashamed of the sorry floral service they render. Large-flowered varieties of loose habit, with drooping flowers, are of little value in beds. A mixture of crimson, scarlet, rose, pink, orange, salmon, buff, blush, and white shades mingle well together, when the habit is similar, and mixed beds are decidedly more effective than those of one colour, or shades of the same colour. *R. D.*

PEA "THE STANLEY."—Having been induced by the description to try this new Pea, recently introduced from America, I procured a packet, planted same alongside a number of other dwarf wrinkled and well-known sorts, about the third week in March, and obtained a result which far exceeded my expectation. The crop was ready for pulling four days after William Hurst, and produced an abundant crop of large pods well filled with Peas of first-class quality. To view the robust and bushy habit of this Pea in full pod was really a grand sight, and in my humble opinion this is destined to become a popular kind amongst dwarf Peas; one very remarkable feature in this variety was the uniformity in the size of pods, there being no small or undersized pods in my crop. This Pea, unlike many of the so-called new kinds, with elaborate descriptions, certainly fulfils in every particular the character given by the raiser. *T. N.*

DANIEL'S CONTINUITY CABBAGE LETTUCE (p. 285).—It may be interesting to your readers to know it does equally well on light as on heavy soil.

I had it here this year for a trial, and am very well pleased with it. I sowed it on April 7 with several other kinds of Cabbage Lettuce. It was planted out the first week in May. I commenced cutting from it on May 20, and it lasted good until the second week in September. All the other Lettuce bolted in July. It is the best Lettuce I have ever grown, both for its good flavour and long keeping. *H. Turner, Fineshade Abbey Gardens, Stamford.*

DIANTHUS NAPOLEON III.—Of all the Dianthus this is, perhaps, one of the most floriferous and showy, its free-blooming habit often causing the death of the plant. The plant seems to be all stems, for it makes but little growth below till late in the season, and is therefore rather slow to increase. The flowers are borne in close heads on stems about 9 inches high, and are of a rich crimson shade. For border and pot culture this Dianthus is very valuable, and no garden should be without it. *J. S.*

POTTS' SEEDLING AND LORD GROSVENOR APPLES.—I have fruited both of these varieties this year for the first time, and find them excellent as early fruits. Lord Grosvenor has not made many shoots, but plenty of fruit spurs; and on some of the trees there were as many as fourteen very fine Apples, one of which when measured was 4 inches wide and 3½ inches high—not a bad fruit for the first year's bearing. *E. Molyneux.*

TOMATOS IN THE OPEN GROUND.—I am well aware that this is no uncommon sight around London and in the warmer parts of the country, but I question if any have been grown in this way so far north of London, and as good as some I saw at Burghley last week. Mr. Gilbert planted them on a south border between rows of Peas early in June, about 2 feet apart in the rows, and trained them on single stems to 4 feet perpendicular stakes; this was done as an experiment, and it has proved a great success, a large quantity of fruit having ripened on them, and more will follow, if we get no frost. Most of them are full grown, and if bad weather should come, and they do not ripen outside, they will soon colour when put on the vinery shelves, and fetch quite as much money in the market, although they may not be so good in flavour as those ripened on the plants. The varieties planted were Laxton's Open Air, Vick's Criterion, and Wynn's Conqueror. This latter variety appears to be identical with the Old Red—it had fruited the best of all; one row left in full fruit bore a heavy crop. A wario soil and position, assisted by the shelter afforded by some rows of Peas, have done much for these Tomatos, but sowing early, and growing the plants to a large size before planting them out, has also contributed largely to Mr. Gilbert's success. *W. H. D.*

LORD GROSVENOR APPLE.—In answer to an enquiry which appeared in the *Gardeners' Chronicle* recently concerning the above variety, I am glad to inform your correspondent that the Lord Grosvenor Apple does well in this garden. I had a strong tree of Blenheim Orange Pippin which never bore fruit since it was planted, the tree being ten years old, so I grafted it with scions of Lord Grosvenor and Newton Wonder, one being an early and the other a late fruit. It has this year a splendid lot of fruit of both varieties. All my trees of Lord Grosvenor are bearing well, and free from canker. I think all who saw my fruit at the Derby show lately, said they were the finest that they had seen this year. My experience is that Lord Grosvenor will flourish where Lord Suffield will not. Four of the heaviest cropping Apples with me this year, are Lord Grosvenor, Domino, Newton Wonder, and Anna Elizabeth. *W. Taylor, King's Newton, Derby.*

A NEW BEDDING TROPÆOLUM, MRS CLIBRAN.—I have seen examples of this, which have been raised and will be sent out by Messrs. W. Clibran & Son, Manchester, next season. It is of a bright golden yellow colour, a profuse flowerer, and the habit of the plant compact and good, its height averaging from 4 to 6 inches. *B.*

THE VICE-REGAL LODGE GARDENS, DUBLIN.—These extensive and well-managed gardens are at all times worthy of a visit from horticulturalists on pleasure bent, as well as those in search of horticultural information. They are, as they have been for the last thirty-six years, under the able management of Mr. G. Smith (an old Sconeite), who is a very courteous and hospitable gentleman. My recent visit (August 24) was a brief and hurried one, so no note-book was introduced, and I now simply jot down a few mental notes, so that I may

place on record the heavy crops of Grapes and Peaches which were observed in the main range of fruit-houses, which is 600 or 700 feet in length. The varieties of Grapes were Mrs. Pince, Lady Downes', Muscat of Alexandria, Gros Colmar, and Black Alicante, the last-named variety being exceptionally good on young Vines in one or two compartments devoted to the culture of this favourite Grape. Some young trees of the Princess of Wales Peach were carrying heavy crops of extra-large fruits; the crops had been taken from the Vines and trees in several houses, the season beginning in May. The trees and Vines were in fine condition, notwithstanding the heavy crops. Several houses, including a large ridge-and-furrow house, with its several beds, were devoted to the growth of Melons, whose crops were very promising. One large span-house was filled with Palms, large plants being set along the middle, with smaller ones on either side, as well as on the side stages—capital decorative subjects, and for which there is great demand at the Vice-regal Lodge during the season. Other houses were well stocked with Orchids and many choice plants. In the kitchen garden, in which the principal ranges of glass are situate, large breadths of vegetables of various kinds bore evidence of good and careful culture. The same may be said of the standard and wall fruit trees, which were bearing excellent crops of fruit. The grounds surrounding the Lord-Lieutenant's charming residence are extensive as well as beautiful, and the kind of keeping of these, and the gardens in general, testifies that they are presided over by an able and energetic practitioner. *Tourist.*

HYACINTHUS CANDICANS.—More than a thousand plants are grown here, and I have left them in the ground during the last two winters, protected from frost by a top-dressing of short litter, our losses being this spring not more than 6 per cent. I have tried the plan of storing the newly-imported bulbs in sand during winter, and planting them in March, with very fair results, planting also in the autumn when the bulbs are received. Of the two I prefer the latter season. Not having had any unprotected last winter, I am unable to give Mr. Earley any information on the point desired, *i.e.*, that of hardiness; but in previous years, when unprotected, the results have not been favourable. For the centre of large beds and in borders, intermixed or surrounded with plants of *Salvia patens*, the effect is pleasing to the eye. *F. Clarke, Louth Castle Gardens.*

HYDRANGEA PANICULATA, treated as a shrub, not as a herbaceous plant, is perfectly hardy now in Mid-Lothian, and has stood unprotected in the open ground for the last four years, being at the present time in fine flower. *Hon. Mrs. Hope.*

THE BRANCHING ETOILE D'OR MARGUERITE.—Having planted out a number of the above plants, we have found them very useful for display and furnishing cut blooms. The large pale yellow single flowers are greatly admired for table decoration. It is a strong grower, and is quite different from the old Etoile d'Or. *W. J. Gilks, Glenthorne, Harrow Weald.*

SOCIETIES.

ROYAL HORTICULTURAL.

FLORAL COMMITTEE AWARDS, *Tuesday, September 22.*

First-class Certificates.

To *Elaeagnus pungens* var. *maculata*, from Messrs. J. Veitch & Sons.

To *Rhododendron Ceres*, from Messrs. J. Veitch & Sons.

Awards of Merit.

To *Dahlia Nellie Mchray*, from Mr. T. S. Ware.

To *Dahlia Mrs. Walter Besant*, from Mr. T. S. Ware.

To *Dahlia Mrs. Ocock*, from Mr. A. Rawlings.

To *Chrysanthemum Viscount Cluquo*, from Mr. R. Owen.

To *Dahlia Sultana*, from Mr. C. Turner.

To *Dahlia Rayon d'Or*, from Mr. C. Turner.

To *Dahlia Mars*, from Mr. C. Turner.

To *Dahlia Lorna Doone*, from Mr. C. Turner.

To *Dahlia Cecil*, from Mr. C. Turner.

To *Dahlia Touchstone*, from Mr. C. Turner.

To *Dahlia Ada Rahan*, from Mr. C. Turner.

To *Dahlia Sir Roger*, from Messrs. H. Cannell & Sons.

To *Dahlia Ernest Cannell*, from Messrs. H. Cannell & Sons.

To *Dahlia Mrs. Thornton*, from Messrs. H. Cannell & Sons.

To *Dahlia Draughtsman*, from Mr. G. S. P. Harris.

To *Dahlia Little Sarah*, from Mr. G. Humphries.

To *Dahlia Mrs. Humphries*, from Mr. G. Humphries.

Botanical Certificate.

To *Cupressus alba*, from Messrs. Pitcher & Manda.

Cultural Commendation.

To *Nerine flexuosa*, from W. Marshall, Esq.

MEDALS.

Silver-Gilt Flora.

To Mr. G. Phippen, for group of *Dahlia* and *Lilies*.

Silver Flora.

To Messrs. J. Cheal & Sons, for collection of *Dahlia*.

Silver Banksian.

To Mr. T. S. Ware, for collection of *Dahlia*.

To Mr. A. Rawlings, for collection of *Dahlia*.

Bronze Banksian.

To Mr. J. T. West, for collection of *Dahlia*.

To Messrs. W. Paul, for collection of *Roses*.

To Mr. J. Walker, for collection of *Asters*.

ORCHID COMMITTEE AWARDS.

Silver Banksian Medal.

To Messrs. F. Sander & Co., for group of *Orchid*.

First-class Certificates.

To Thos. Statter, Esq., for *Cattleya intermedia alba*.

To Baron Schroder, for *Cypripedium Antigonum*.

FRUIT COMMITTEE.

Silver Medal.

To Mr. W. Paul, Waltham Cross, for collection of *Apples* and *Pears*.

FUNGUS FORAY OF THE YORKSHIRE NATURALISTS' UNION.

ON Wednesday and Thursday, September 16 and 17, those members of the Union interested in fungi met at Doncaster, to explore the neighbourhood. The attendance was excellent, testifying to the increased interest taken in the study of those aberrant members of plant-life, fascinating not only on account of the great variety of form and colour presented, but more especially on account of the great insight afforded by many kinds bearing on such problems as the origin of parasitism, evolution of sex, power of adaptation to varied conditions, relation between fungi and numerous diseases of higher types of life, &c.—problems which now claim part of the time devoted solely in the past to an honest endeavour to find out the name previously given to a particular fungus, an investigation that too frequently resulted only in individual conviction; nevertheless, the ideal was always realised—an addition to the county list. When the questionable ambition of racing for the first place, as to number of species between county clubs has had its day, it is to be hoped that the energy at present so expended may be utilised for a higher purpose. Lists to be of value should contain a paragraph at the commencement to the effect that the material on which the list is founded can be examined at ——. Species of *Agaricus* were scarce, many sections being entirely absent. *Lactarius*, *Hygrophorus*, and *Russula*, were best represented, amongst the least common being *Lactarius volemus*, *L. uvidus*, *Russula aurata*, *Hygrophorus chrysodon*, *Paxillus crassus*. *Merulius aureus* was found in fine condition, this is probably its first British record. In future there is to be an annual foray in Yorkshire.

FUNGUS FORAY OF THE STIRLING NATURAL HISTORY AND ARCHÆOLOGICAL.

SEPTEMBER 26.—It fell to the lot of the writer to represent, as well as he could, the Cryptogamic Society of Scotland at the meeting of the Stirling Naturalists' Society; so, accompanied by Mr. H. G. Ward, we arranged to go. The Glasgow mycologists kindly arranged for an excursion, on Friday, September 25, so that Cadder Wilderness might be taken *en route*, and thus no time would be lost. Now, Cadder Wilderness has obtained a considerable celebrity amongst British mycological stations, as it has, in bygone days, been the accredited home of not one but all the rare species at that time known to occur in the British fungus flora. So, in high spirits, we started, under the guidance of the leading mycologist in the second city of the empire, for this Tom Tiddler's ground. No sooner was the railway carriage entered, than discussions on various mycological problems began—where this species grew, where that flourished best, the colour of this one's spores, and of that one's stem; but, above all, what varieties we should find. Alas, for human hopes! Somebody had blundered about the train, and instead of treading the majestic glades of Cadder, we found ourselves, after an hour's travelling, back again in Glasgow, with no more trains to Cadder till 6 o'clock in the evening. It was pitiful to see our dejected countenances, but we bore our trials like mycologists. This *contre coup* enabled the writer to proceed to Stirling at once. On enquiry, it was found that the Stirling Society was likely to master on the morrow to the extent of some fifty members, so that our work seemed to be

cut out for us. It was also learned that, meteorologically, Stirling was a particularly favoured spot, being so sheltered by the hills that extremes of weather were almost unknown, and that storms either of rain, snow, or wind practically did not occur. This was grand news, for the weather during the previous week had been anything but good in Scotland. Somehow or other the barometer at our hotel went altogether wrong in the night; the steel hand had receded in a most unsatisfactory manner. When we consulted it on the morning of the excursion, we endeavoured to comfort ourselves with the dictum that "no reliance can be placed on those old-fashioned wheel-barometers." A start was made at 10 A.M., after visiting the Manse of St. Ninian's, and a small wood, Cocksett Plantation, which overlooked the battle-field of Bannockburn. It yielded some twenty-five species in about as many minutes. The fine Fir woods of Polmaise Castle were next visited, and we explored them to our heart's content. Here, the rain began to fall, and the wind increased to a strong gale. In spite of this, however, many interesting species were encountered, including *Agaricus flammans*, *euthelus*, *sipiens*, *ambustus*, *crebrius*, *dispersus*, *hygrophorus*, *hypothecus*, *Polyporus amorphus*, and *Thelephora caryophylla*. Climbing to the top of the hill, which overlooked a valley to the west, we witnessed an interesting phenomenon. The western face of this hill was steep and precipitous. The wind was blowing from the west so heavily that we could with difficulty hold our feet against it, but at the edge of the precipice we were in a narrow zone of calm air. The explanation is simple, the wind blowing directly on to the face of the cliff was deflected upwards, if one may say so, the gusts passed over our heads when we stood on the extreme edge of the cliff. At the appointed time we repaired amidst the storm of wind and drenching showers to the appointed rendezvous, and await the arrival of the Stirling naturalists. In due time a solitary figure was made out, fighting its way against the storm; this proved to be the Rev. J. Robertson, the minister of St. Ninian's—the other forty-nine naturalists having thought it wiser to stay at home. We hunted the grand Fir woods in company, until we all became sufficiently moist, and then repaired to Stirling. A pleasant evening was spent in examining our finds; but when we turned our steps southwards, we could but remark, with regard to Glasgow and Stirling, "Ah, they manage these things better in Paisley!" C. D. P.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

SWIETENIA MAHOGANI.—Can any of your readers say if *Swietenia Mahogani* is grown in this country? [at Kew]. I understand it is a very handsome tree, and would be well worth its room in our greenhouses. H. H. G.

MARKETS.

COVENT GARDEN, October 1.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

BUSINESS brisk, with heavy supplies of Kent Cobs selling freely at higher rates. *James Webber, Wholesale Apple Market.*

POTATOS.

With better weather, arrivals have come to hand in a much finer condition, and many parcels, in consequence, have been disposed of at an advance on last week's quotations, the market being very firm for best samples. *J. B. Thomas.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 26, is furnished from the Meteorological Office:—

"The weather has been changeable and unsettled in all parts of the Kingdom. Extremely heavy rain was experienced over the east of Scotland during the earlier days of the week, and some heavy falls occurred from time to time in the western and north-

western districts. In most parts of England, however, the falls, although equally frequent, were less heavy.

"The temperature has been slightly below the mean in 'Scotland, E. and the Channel Islands,' just equal to the mean in nearly all other districts, and a little above it in 'England E. and S.' The highest of the maxima were recorded on rather irregular dates, and ranged between 62° and 64° in 'Scotland,' from 65° to 67° in 'Ireland,' and from 65° to 69° over 'England.' The lowest of the minima were registered on the 23rd in the north, and on varying dates elsewhere, they were as low as 30° in 'Scotland, N.,' and 31° in 'Scotland, E. and W.' Elsewhere they varied from 36° in 'England, N.W.,' to 43° in 'England, N.E.'

"The rainfall has been rather less than the mean in 'England, E.,' the 'Midland Counties,' and 'England, S. and S.W.,' as well as in 'Ireland, N.' and the 'Channel Islands.' In all other districts there has been an excess. In 'Scotland, E.' the fall has amounted to about three times the average.

"The bright sunshine has exceeded the mean in 'Ireland,' but has been deficient over 'Great Britain.' The percentage of the possible amount of duration ranged from 49 in 'Ireland, S.,' 42 in 'Ireland, N.,' and 39 in the 'Channel Islands,' to between 23 and 25 over the greater part of 'England,' and the 'west of Scotland,' and to between 19 and 20 over 'Scotland, E. and N.'

NOTICES TO CORRESPONDENTS.

APPLE SCALE: *T. S. W.* Mussel Scale (*Mytilaspis pomorum*).

BOOKS: *E. L. Cassell's Popular Gardening* contains all you want. It is in four volumes, the price moderate.—*S. D.* You really require a library of works on gardening to enable you to grow all those fruits that you named in your letter; but we will merely name two—*The Forcing Garden*, by Samuel Wood (Crosby Lockwood & Co., Stationers' Hall Court, London); and *Handy Book of Fruit Culture Under Glass*, by David Thomson (see previous reply).

CRACKING OF PEARS: *G. W.* Your Pears crack because they are affected with a fungus called *Fusicladium*, which feeds on the rind of the Pear and the tissues beneath it, and kills them whilst the central portions go on growing. The outer portions being no longer elastic, crack. You can do nothing now but carefully destroy all the fruit. Your Plums have probably cracked from the excessive wet to which they have been subjected.

DAHLIAS: *A. F. T.* Curious, but not worth preserving, as there are so many better. Ask some trade grower for the name of the variety. We do not know it.

EEL WORMS IN CUCUMBER ROOTS: *P. F. A.* Certainly; burn both plants and soil, so that next years crop may stand less risk.

FUNGUS ON TUSSILAGO FALFARA: *J. B. W.* The fungus is *Coleosporium souchi*. The uredo and telentospores both occur on same plant. The parasite on *Populus alba* is *Melampsora acidoides*; the acidium stage of this being found on *Mercurialis perennis*, and is called *Croonia mercurialis*.

GRAPES: *G. H.* Some of the berries sent are affected by the dreaded "spot," for which no cure is known. Collect and burn all the berries which show any signs of the malady. The bunch of Muscats sent show that there has been an excess of moisture in the vinery, either from pot plants being placed there, or the border which has been watered unadvisedly. The berries drop at the least touch, or even without being disturbed. Many a crop of Muscats is spoiled when ripe from this cause.

NAMES OF FRUIT: *D. Donald.* Not Vanguard Peach, which is a Noblesse in appearance, and more hardy and robust, but yellow Alberge.—*Homestead.* Plums: 1, Czar; 2 and 3, Victoria; 4, Pershore; 5, common Damson; 6, 7, 8, not recognised.—*M. E. V.* Not recognised. Please send proper specimens.—*J. Taylor.* 1, Williams' Bon Chrétien; 2 and 4, not recognised; 3, Louise Bonne; 5, Marie Louise. Apple not recognised.—*B. B., Exeter.* 1, Marie Louise; 2, Emil d'Heyst; 3, Louise Bonne.—*W. J. S. Pears.* 1, Beurré Superfin; 2, Secku; 3, Louise Bonne. Apples: 5, Royal Russet; 6, Round Winter Nonsuch; 4, too small to recognise.—*R. Ward.* 1, Emperor

Alexander; 2, Duchess of Oldenburgh; 3 and 4, not recognised; 5, Cox's Pomona; 6, Fearn's Pippin.—*T. K. & Co.* Apple: Orange Pippin. Pear: rotten.—*H. T.* 1, Williams' Bon Chrétien; 2, Beurré de Capianmont; 3, Souvenir du Congrès; 4, Tower of Glamis; 5 and 6, miserable specimens—cannot be recognised.—*Ted.* Pear: Williams' Bon Chrétien. Apple: Stirling Castle.—*C. G.* Pears: 6, Vicar of Winkfield; 5, not recognised. Apples: 1, Duchess of Oldenburgh; 2 and 3, poor samples! not recognised; 4, Old Nonpareil.—*J. H.* Plums: Yellow is Magnum Bonum, red is Pond's Seedling. Apples: 1, Brad-dick's Nonpareil; 2, Tibbett's Incomparable; 3, Colon d'Or.—*G. J.* Apples: 1, Ribston Pippin; 2, Margil; 3, New Hawthornden. Pears: 4, Gansel's Bergamot; 5, Beurré Bachelier; 6, Rosemary Russet.—*W. H. Tillet.* Pear: Beurré d'Amanlis. Apple: Kerry Pippin.—*Pomona.* Apples: 1, identical with Ecklinville; 2, Lord Derby; 3, not recognised; 4, Scarlet Nonpareil.

NAMES OF PLANTS: *G. M. A.* Campanula rotundi-folia var. alba.—*J. B. & S.* 1, Salvia Horminum; 2, Mentha rotundifolia. *D. Dewar.*—*W. S. S.* 1, Spiræa sp.; 2, Spiræa sp. (impossible to name without flowers).—*J. R.* Anchusa italica; Cupressus sempervirens. Many thanks for the Passionflower.—*J. W. B.* 1, Lycium barbarum; 2, Saxifraga crassifolia; 3, a seedling form of Biota orientalis; 4, Daphne Mezereum; 5, Berberis Bealei or Fortunei; 6, Phalaris arundinacea varie-gata; 7, Thuiopsis borealis; 8, Cupressus Goveniana.—*G. L.* Bignonia radicans.—*An Old Sub-scriber.* Chrysocoma Linosyris.—*L. & B.* Medica-go lupulina.—*Pomona.* 5, Physalis Alkekengi; Winter Cherry, a hardy European member of the order Solanaceæ. It is not poisonous, and the fruits are eaten at dessert in Spain and other south European countries.—*P. A. Falkirk.* 1, Cas-tanea vulgaris (the Sweet Chestnut); 2, Pyrus Aria (the White Bean).—*G. H.* Lastrea aristata variegata, Croton longifolius var.—*H. R.* 1, Stan-hopea Wardii; 2 and 3, varieties of Stanhopea oculata.—*H. E.* One of the varieties of Gladiolus Colvillei.

PHLOXES, PENTSTEMONS, &c.: *J. Forbes.* Doubtless excellent of their kind; but, the flowers had fallen in almost every case. The crimson bedder Antirrhinum appeared to be a good plant.

SHANKING OF GRAPES: *J. B.* See *Gardeners' Chronicle*, July, 1891, p. 23.

THE GROWING OF FRUIT UNDER GLASS: *S. D.* Take service for several years with two or three growers for market. You should advertise in these columns, stating your wants.

FIG. 50.—SLUGWORM AFFECTING THE PEAR TREE.

THE PEAR SLUG: *A.* Spraying is of little use, as it would have to be applied when the fruit is on the tree. After feeding on the leaves, the caterpillar descends to the soil, there to form a cocoon, from which the perfect insect is produced in fifteen days. The application of quick-lime to the surface is therefore recommended.

PHOTOGRAPHS RECEIVED (with many thanks).—*J. O'B.*—*T. P.*, Beckenham.

STANDEN'S Established 30 Years. MANURE.

Exceeds all others in general fertilising properties and staying powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry Powder, with very little smell.

It is consequently particularly adaptable for Ladies interested in Plant Culture.

The highly fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

Sold in Tins, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each.

And in Kegs (free), at Reduced Prices:—28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

LETHORION (VAPOUR GONE), (PATENT).

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure.

PRICES—For Frames, &c., of 50 cubic feet, 6d.; 100 feet, 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each.

Owing to the enormous demand, intending users should give their Seedsmen Early Orders to secure a supply.

By permission of the Hon. Board of Customs
DUTY FREE.

TOBACCO PREPARATIONS FOR HORTICULTURAL USE.

THE "LONDON" TOBACCO JUICE. (FREE OF DUTY.)

Manufactured from strong American Leaf Tobacco, and highly concentrated. Sold in bottles:—Pints, 1s.; quarts, 1s. 9d.; half gall., 2s. 6d.; gall., 4s. Or, in casks of 10 gallons, and upwards, at 2s. 6d. per gallon.

EXTRA STRONG TOBACCO JUICE.

Specially manufactured for Evaporating in Greenhouses. Pints, 1s. 6d.; quarts, 2s. 9d.; half-gall., 6s.; gall., 11s. And in kegs of 5 gallons, 10s. 6d. per gall.; 10 gallons, 10s. per gallon.

THE "LONDON" TOBACCO POWDER.

This preparation consists of best Virginian Tobacco, finely ground and mixed with other ingredients of an essential character. Price, in tins, 1s., 2s. 6d., and 4s. Or, in bulk, £3 per cwt.

NICOTINE SOAP.

An effectual and speedy Eradicator of Scale, Thrip, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting plants, without injury to foliage. In jars, 1s. 6d. and 3s. each, and in tins, 5s. 6d., 15s. 6d., and 25s. each.

The above articles are manufactured only at our Bonded Stores, Shad Thames, S.E., and are the only reliable Horticultural Tobacco Preparations produced. We caution the public against spurious articles offered by several firms.

(Limited), are always in a position to RECOMMEND
MEN of the highest respectability, and thoroughly practical
at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

THE LIVERPOOL HORTICULTURAL
CO. (JOHN COWAN), Limited, The Vineyard and Nur-
series, Garston, Liverpool, are in a position to recommend a
first-rate man as HEAD GARDENER, or GARDENER and
BAILIFF; also a thoroughly competent man as HEAD GAR-
DENER, who has a good knowledge of Orchids; unexceptional
references in each case.

Head Gardeners.

JOHN LAING AND SONS can at present
recommend with every confidence several energetic
and practical Men of tested ability and first-rate character.
Ladies and Gentlemen in want of GARDENERS and BAILIFFS,
and HEAD GARDENERS for first-rate Establishments or
Single-handed Situations, can be suited and have full par-
ticulars by applying at Staunstead Park Nurseries, Forest Hill,
London, S.E.

RICHARD SMITH AND CO.
beg to announce that they are constantly receiving
applications from Gardeners seeking situations, and that
they will be able to supply any Lady or Gentleman with
particulars, &c.—St. John's Nurseries, Worcester.

To Noblemen and Gentlemen requiring Land Agents,
STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all
times upon their Register reliable and competent MEN,
several of whom are personally well known to Messrs. Carter.
Enquiries should be made to 237 and 238, High Holborn, W.C.

SCOTCH GARDENERS.—I have at present
several very superior MEN on my Register, whose char-
acter and ability will bear the strictest investigation.—
JOHN DOWNIE, Sea-Isman, 141, Princes Street, Edinburgh.

GARDENER (HEAD).—Age 43; twenty-nine
years' experience. Sixteen years Head to the late Lord
Cottesloe.—F. SMALL, Ruckingham Road, Winslow, Bucks.

GARDENER (HEAD).—Age 38, married;
twenty years' experience in all branches. Good refer-
ence from present employer. Abstainer.—J. C., Keynes,
Williams & Co., Salisbury.

GARDENER (HEAD), where two or three
are kept; or FOREMAN, in good establishment.—
Age 26, married when suited; thirteen years' experience.
Well up in Vines, Melons, Cucumbers, Stove Plants, also
Chrysanthemums.—H. MASON, The Gardeos, Shuckburgh
Park, Daventry, Northamptonshire.

GARDENER (HEAD).—Age 33; married.
Thoroughly experienced in the cultivation of Plants,
Vines, Peaches, Melons, Vegetables, &c. Advertiser has
received several Certificates for good culture of the above from
the Royal Horticultural Society, and can produce good refer-
ences from first-class places. Over six years as Head in present
situation.—W. PALMER, Thames Ditton House, Thames
Ditton, Surrey.

£5 BONUS to anyone furnishing the
Advertiser with information of any Gardening changes
that will lead to obtaining an engagement as HEAD GAR-
DENER, where four or more are kept. Highest reference from
previous employers.—HORTUS, Gotch's Library, Wokingham.

GARDENER (HEAD); age 38.—Mr. WIL-
LIAMS, Gardener to the Earl of Lisburn, Crosswood
Park, Aberystwith, can with every confidence recommend a
first-class man as above. Life experience in good places.
Eight years in last place as Head. Excellent testimonials.
—Apply as above, stating wages and all particulars.

HOLLOWAY'S PILLS.—Liver, Lungs, and Kidneys.—Most diseases of these purifying organs arise from obstructions, over the removal of which these celebrated Pills exercise the most perfect control. A course of them is strongly recommended as a remedy for such chronic affections as liver enlargements, congestion of the lungs, torpidity of the kidneys, and other functional disorders, which cause much present suffering, and, if neglected, lay the foundation of organic diseases. Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In indigestion, nervous affections, gout, and rheumatism, these Pills have achieved for themselves universal fame. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

THE ELEPHANT MOTH DENDROBE.

Dendrobium Phalænopsis, var. Schroderianum, THE KING OF THE GENUS.

Which may be considered the grandest and in every way the finest known Orchid, and

THE ORCHID SENSATION OF THE CENTURY.

It is the grandest Orchid ever introduced. There is no gem in the whole Orchid Flora comparable to this, the "KING OF DENDROBES"; and, for the introduction, we are indebted to the energy and enterprise of Mr. F. SANDER.

Nearly 1000 Grand Plants will be SOLD by AUCTION at

MESSRS. PROTHEROE & MORRIS' ROOMS,

On FRIDAY NEXT, OCTOBER 16.

There are only Seven Plants in Europe, which are mostly in the princely Collection of Baron J. H. W. Schroder. This Orchid is, among Dendrobies, the Vanda Sanderiana among Vandas, and as totally distinct from all other Dendrobies as Vanda Sanderiana from all other Vandas. It must be distinctly understood, that the Dendrobium we offer is absolutely unlike any other Dendrobium phalænopsis variety, and a gem among Orchids quite incomparable.

THE FACT of Baron Schroder flowering each of his plants annually proves how free-growing this Dendrobe is.

THE FACT of the sensation it caused this spring when exhibited before the Royal Horticultural Society, at the Drill Hall, proves that when we state this Dendrobium to be "THE KING OF THE GENUS," we do not over-estimate its beauty.

THE FACT that about seven plants, now in collections, come from two small plants originally introduced to the Royal Gardens at Kew, conclusively proves its free growth.

THE FACT is, Mr. JAMES O'BRIEN says it is a very free doer, as is evidenced by fact of the plants, now in collections, having been grown from such small scraps as the original plants were when first received.

THE FACT that there will be shown, on the day of Sale, dried flowers, ranging from white to rose and purple, proves that our New Guinea variety is finer than the original.

THE FACT that we are able to show quantities of flower-spikes over 2 feet long, proves that this Dendrobe is as fine for cutting purposes as Odontoglossum Alexandræ, and it even surpasses that grand Orchid in its more brilliant colouring, lasting equally long in perfection.

SANDER, ST. ALBANS.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 10, 1891.

APPLE CULTURE AND APPLE ORCHARDS.

YOUR recent articles advocating fruit-tree culture on a more extensive scale than hitherto, will lose nothing by friendly criticism, or more critical handling of the subject than your correspondents have accorded it. I do not consider that the main object, that is the more general culture of fruits, is likely to be obtained by a too great stickling for rule-of-thumb methods of the gardener. Spade husbandry is undoubtedly the best if well carried out; but it is not desirable to advocate for all places and soils digging the ground by hand, or to insist on its being needful in securing good crops of fruit. When fruit trees are planted, they repay proper outlay in this respect, but once this is done well, I maintain that the trees in ordinarily good soils will need but little more care. The knowledge of this fact should sweep away any difficulties which may arise in the minds of inexperienced planters.

Although it is recorded that twenty-two named varieties of the Apple were in cultivation in Pliny's time, and, according to Stow, "Carp and Pepins" (Pippins) were introduced about the middle of the sixteenth century; still, knowing the Crab is a native of most countries of Europe, there can be little doubt that all the Apples of the present day sprang therefrom. A more hardy and enduring tree could not well be discovered. I have seen it grow out from the crevices of the roots of a huge Oak, and extend to large size, retaining the utmost vigour; whilst, whether amidst brushwood or in hedgerows, it proves irrepressible. Such being the prototype of the Crab, I have no hesitation in saying, that Apple trees on the Crab once well planted in good soils, having natural drainage, will bear fruit abundantly for very long periods, provided they are permitted to grow, more or less, naturally. I would not suggest that no pruning will be required, but I do believe more young trees are ruined by injudicious and excessive pruning than by any other cause. It is only necessary to observe the pole-trimmed fruitless branches of what are known as pyramidal trees, in numerous suburban gardens, to determine this fact.

The late Mr. Shirley Hibberd was perfectly right when he inveighed against this unnatural practice when carried to extremes. For such a tree to succeed, it must not be pollarded. An Apple tree will grow to large dimensions. Speechly records a tree growing at Burton-Joyce, near Nottingham, with branches extending 20 to 24 feet from the bole, which, in 1792, produced upwards of 100 pecks of Apples; and I can well believe it, as I have the remains of an Apple tree in

my own garden, the bole of which measures 55 inches in circumference; and a local market-gardener living near affirms that he once bought the crop upon it at a given price, and subsequently gathered the crop, which amounted to 25 bushels. Yet this tree grew upon grass land, never receiving any artificial aid whatever. Speechley's tree was reckoned to be about sixty years old, which is probably the age of my tree. Who, therefore, can calculate the quantity of fruit such a tree produced from first to last, and what the amount of profit has been in all those years?

The Apple, to succeed, must have plenty of head room. It may be necessary, as regards such varieties as King of the Pippins, Wellingtons, &c., occasionally to thin out the spray from the centres of the trees; not so, however, in the case of Bleaheim Orange, Hawthornedens, and those of similar habit.

Such small attention as the above, and an occasional surface mulching with manure, &c., is all that such trees require to produce, after the first eight years, fairly uniform crops—such crops, in fact, as it is not possible for annually severely-pruned trees to give under any circumstances.

I have heard it said by self-esteemed wiseacres, that Apple trees "should be so pruned as to admit of wild ducks flying between the branches." My good neighbour next door followed this practice, and I have seen a load of faggots carted from his orchard on more than one occasion. The result was, he had no crops. Latterly he has taken a lesson from over the fence, and his trees have assumed more natural shape, and are fruiting admirably. But it will be said by those who are accustomed to toy or dwarfed trees, on the Paradise stock, and have little practice with well developed orchard trees, "Dwarfs are best, and give greater returns," which is a contention I shall never cease opposing, even though I am told I am "behind my day." When the Archimedian mowing-machine first came over, I alone contended it never would answer. Then also I was adjudged "behind the times." Patience then, as it will now, awarded me, however. The Archimedian machine had another cutter blade added to it, and as a near copyist of Ransome, Green, and others, it remains amongst us. That dwarf trees give their limited crops earlier I am well aware, but the actual gatherings cannot compare with those of standard trees. My three standard Hawthornedens, never large-headed trees, give heavy crops without fail year by year. Reverting to my fruit-book for this year, I find they have already been denuded of seven sieves of fine fruit, some of which average 1 lb. in weight. Such gatherings commenced on July 25, having returned 6s. and 5s. per sieve, all outgoing accounted for besides. From 8 to 10 sieves of Apples still remain upon these same trees, to be gathered in successive batches. If we admit that three dwarf trees could occupy the space required by each of these trees, making a total of nine, or even say they occupy the space of twelve dwarf trees, is it to be imagined the latter twelve would produce 17 sieves of fruit, or even half that quantity?

Against the standards, grass feed below has to be credited; but against the dwarfs, cultivated ground must be debited, to say nothing as regards original cost of the trees.

Having stated the facts, I freely admit that both systems of culture are desirable and profitable, and am assured that both can be carried to a successful issue, with a tithe the outlay suggested, or at least hinted at, in much that is written. Even as regards districts possessed of undrained subsoils, and indifferent ground generally, where deep light soils with gravelly subsoils do not exist, but in their lieu cold clays, &c., shallow planting should be followed, and if it is possible to excavate a hole 3 feet deep, and deposit brick rubbish 6 inches in depth therein, before the soil is placed in, so much the better. Chopped-up turf is excellent root-food for them, hence all who plant on grass lands, will do well to place the surface spit by itself until excavations are made, then to chop it up and place it at the bottom. When shallow planting is intended, the roots should be spread out upon the freshly-moved soil not more

than 2 inches below the ground level, a mound being placed around the bole of each to steady it.

In recent controversies much has been said and written concerning the miserable appearance of the majority of old orchards scattered throughout the country, and this has been made a handle whereon to hang theories of unlimited neglect.

This is undoubtedly a common error. We have no reason to imagine those in possession of such orchards would not resuscitate and improve the trees if they could. Indeed, the presence of young trees planted amongst the old, all but invariably show the bent of their owners. The fact is, few take into consideration the longevity of these trees, and the immense age of the majority of such orchards. Haller averred that certain orchard trees in Hertfordshire had stood there a thousand years, and were still prolific (!). Judged by this imagery, the ages of many existing orchards are very old; so that the wonder should be, not that the trees are so feeble, but that they exist at all.

Aged orchards are often associated with extremely old homesteads—a suggestion that, at least, one is as old as the other. But the mind cannot rest there. Even supposing the tenements have been erected, it is no proof that the orchards may not have graced the surroundings of still earlier ones. It will be well, therefore, to put aside the insinuation that aged orchards generally show the owner's neglect; and to have resort to new plantings.

The Apple can be brought to higher perfection in Britain than any other fruit; very good examples are produced in the Highlands and Orkneys, as well as the Shetland Isles; hence there is no valid reason against planting freely to meet our increasing demands.

The recommendation to plant this fruit plentifully is not so new as some aspiring publicists would have us believe. Thus wrote Gerard early in the seventeenth century:—"I have seen in the pastures and hedgerows about the grounds of a worshipful gentleman dwelling 2 miles from Hereford, called Master Bednome, so many trees of all sorts that the tenants drinke for the most part no other drinke but that which is made of Apples; the quantity is such, that by the report of the gentleman himselfe, the parson has for tithe many hogsheds of syder. The hogs are fed with the fallings of them, which are so many that they make choice of those Apples they do eat, who will not taste of any but the best. An example, doubtles, to be followed of gentlemen that haue land and living; but ennie faith, the poore will break down our hedges, and we shall haue the least part of the fruit. But forward in the name of God. Graffe, set, plant, and nourish up trees in euery corner of your grounds; the labour is small, the cost is nothing, the comoditie is great. Yourselves shall haue plenty, the poor shall haue somewhat in time of want to relieue their necessitie, and God shall reward your good mindes and diligence." *William Earley.*

NEW OR NOTEWORTHY PLANTS.

THUNIA MASTERSIANA, n. sp.*

This is a new and exceedingly handsome Thunia. The plant is of strong, robust habit; the stems immediately above the ground are as thick as the

* *Thunia Mastersiana*, n. sp. — Planta elata 3–4 pedes alta distichophylla. Folia glauca oblongo-lanceolata v. lanceolata, 10 poll. longa, 1½ poll. lata, suprema breviora racemum superantia. Racemus pluriflorus. Bractee oblonge acutae naviculares sub-antheri, persistentes reflexe ovarius sub-breviores. Sepalum dorsale lineare oblongum (v. ligulatum) acutum; lateralia paulum majora postice in pseudocalcar breve conicum producta; petala paulo minor subaequalia, labellum campanulatum (explanatum fere quadratum) brevissime apiculatum margine revoluto undulato dentato decorum, disco lineis 7–9–11 elevatis crispatis antice ramosis instructum. Gynostemium postice rotundatum marginatum apice dilatatum tridentatum adjectis dentibus quibusdam minoribus; labello paulo brevius. Flo. 25 poll. diametro, omnino caudatus, labelli calli auri purpureo-marginati. Flores racemi omnes coetanei. — Ex Moulmein; importari jussit, F. Sander, Verulamensis.

thumb; they are more than 4 feet in height, with glaucous, densely crowded, distichous, and strong, dorsiventral leaves of 10 to 12 inches in length by nearly 2 inches in breadth. In general appearance the plant is more like a Palm than is any other Thunia. It is, of course, nearly allied to *T. alba*, Rchb. f. (*Phainus albus*, Lindl.), and perhaps even more closely to *T. pulchra*, Rchb. f. (introduced twenty or more years ago by Mr. Low), but it differs from both. Firstly, the growth of this species is more luxuriant in every part; secondly, the flowers, although very beautiful, are scarcely half the size of those of the two allied species; thirdly, the labellum is more campanulate, or bell-shaped, only the extreme margin is revolute; it is extremely finely serrulated, and the basal part is protracted into a very blunt spur (in *T. alba* the spur is well-developed; in *T. pulchra* it is altogether wanting). All these characteristics are plainly shown. The peculiarities of the rather large gynostemium are more nearly like those of *T. pulchra*. The plant was introduced from Moulmein, and flowered during the last weeks of July and first of August, at St. Albans, in Mr. F. Sander's houses. The new species is named in honour of Dr. M. T. Masters. *Dr. Kränlin.*

DEVONSHIRE FERNS.

MAY I be permitted to remark upon one or two points raised by your correspondent, Mr. Napper, lately, in the above connection. In his reference to the "kinds of Devonshire Ferns," it appears to me that he confounds species with varieties, the latter of which are alone so numerous as to render their classification difficult. I am strengthened in this impression by his concluding remark, that "latterly the various forms of British and exotic hardy Ferns have been manipulated, and many seedlings raised, so that now we have in cultivation hundreds of garden varieties, many being extremely novel and beautiful." Here he displays his knowledge of the existence of these varieties, but quite wrongly imputes them to "manipulation" under culture; and here I perceive the solution of the puzzle which he finds in "Strolling Devonian's" remarks, since it is precisely in the shady lanes of Devon that hundreds of beautiful varieties have been found "wild," and amongst these perfectly wild "finds" of Devon and elsewhere in the British Isles are to be found the majority of the best and more perfect forms. In point of fact, in Mr. Lowe's recent list of some 1800 forms, 1100 were found wild, without reckoning a large additional number of repeats, many of which, though too near to previous records to be differentiated from them by name, are distinct enough to connoisseurs, while, from their being found in far distant localities, they are obviously independent "sports."

In hunting, therefore, a district so rich as Devonshire, while the species hunter will be jubilant over some 25 "kinds," i.e., species, the experienced variety hunter, given time enough, will accumulate hundreds of perfectly distinct types. Mr. Moly, for instance, in the neighbouring county of Dorset, has something like 600, gathered mostly within driving distance of his house, and these 600 I can vouch by actual inspection, are by no means distinguished only by hair-splitting differences, but are all very distinct from each other, inferior types having been ignored when discovered. The late Dr. Wills, resident a few miles from Mr. Moly, had also a large collection of "own finds," distinct and beautiful.

It is clear to me, therefore, that your correspondent when in his native county, regarded, as he apparently still regards, the varieties as mere horticultural productions, and hence did not find them because he did not seek. The chance of a good form being discovered without specially careful and persevering search, is a very remote possibility; while if the attention be concentrated in the "varietal" direction, and the eye become accustomed to discriminate differences quickly, prizes of the most un-

FIG. 51.—*HELIANTHUS MULTIFLORUS*. (SEE P. 428.)

expected types are sure sooner or later to reward the patient hunter.

If Mr. Napper will take this to heart, I am sure his next visit to Devon will add something to his collection, and alter his views about the "manipulative" origin of our numberless beautiful abnormal types. So far as I know, not a single new "type" has originated under culture, all that has been done is to raise seedlings and select the best, which in some cases has resulted in improvements, and recently good types have been "crossed" with happy results.

Another point in his interesting letter touches the old bugbear of nomenclature, not in this case varietal, but specific. To my mind, it is very much to be lamented that a recently-published popular book should have lumped together species which all cultivators, if not the scientific botanist, have long pronounced as quite distinct, and which were formerly recognised as such by the same writer, who now reverts to an older classification. No man has more respect than myself for the scientific side of this question, for I well know that when we step outside our own islands, we may find and do find intermediate specific types, which form links more or less intimate between the genera. Nature, in short, has no hard-and-fast lines, such as every system of classification attempts to draw. When, however, I find our Shield Fern (*Polystichum*) and our Buckler Fern (*Lastrea*) lumped together as one under the name of *Aspidium*, I rebel, and so does everyone who grows them. They are absolutely distinct, generally and in detail; and even in the indusium or spore cover, the round central-stalked one of the *Polystichum* differentiates it altogether from the kidney-shaped cover of the *Lastrea*. The *Athyrium*, too, has culturally no affinity whatever to the genus *Asplenium*, into which it is dragged anew on account of a strained resemblance in the mode of fructification, although in habit of growth, habitat, size, texture, varietal tendencies, and deciduousness, it stands as far apart as can be. Everyone knows the plant as *Athyrium*, yet for no good reason that can be given, confusion is rendered worse confounded by a practically fresh christening. *Blechnum* is another case where "lumping" is carried to excess at the expense of a well-known name, justified by a distinct difference in the fructification from *Lomaria*, into which it is again thrust. Your correspondent, by the way, gives this the popular name of the rough Spleenwort, which is quite new to me; the Shield Ferns (*Polystichum*) and Buckler Ferns (*Lastrea*, *Nephrodium* or *Aspidium*) he lumps together as Shield Ferns, which is wrong. He omits, too, *Lastrea montana*, which is common enough; *Adiantum capillus-veneris* (Maidenhair) and *P. dryopteris* (Oak Fern), which I found on Exmoor, are rarer, but still to be found, vandalism notwithstanding.

In conclusion, I would advise all British Fern growers to stick to the popular nomenclature with which they are familiar, until very good and cogent reasons are given for alterations, and not to adopt changes off-hand under the impression that they are thereby keeping up with the times; they may, as in the case before us, be going back instead of forward. *Charles T. Drury, F.L.S., F.R.H.S.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM × CORADINEL.

Many of the forms of this very variable natural hybrid approach more nearly in character to *O. Lindleyanum* than to the other parent, *O. crispum*, but one which has now appeared in the collection of Sir Charles Strickland, Bart., is a decided exception, and is more like the original form figured and described in these columns in 1872 (p. 1068, fig. 251). It has quite the shape of *O. crispum*, the sepals being over 6 lines and the petals over 7 lines broad, and all pale primrose in colour. Each has a large chestnut blotch about the middle, and the sepal's

some smaller ones near the base. The lip is oblong, over 6 lines broad, and retuse with a slender apiculus over 1 line long. The crest, however, is nearer to *O. Lindleyanum*, and in front of it is a very large chestnut blotch, leaving only a narrow white margin beside. The stalk of the lip is 6 lines long, and the column 8 lines, but the wings of the latter, as in *Coradinei* generally, approach closely to *O. Lindleyanum*. It is a very handsome form, and another example of the immense range of variation seen in some of these natural hybrids.

CATASETUM FIMBRIATUM ♂ AND ♀.

Another *Catasetum* must now be added to the list of those of which both sexes are known, making seventeen in all. A plant of *Catasetum fimbriatum*, Lindl., in the collection of W. Wright, Esq., The Grange, Denmark Hill (gr., Mr. G. Parrott), has produced a raceme of four flowers, of which the two lower ones are females, and the upper ones males. It has now been sent to Kew for preservation. The female flower has the sepals and petals strongly reflexed, light green, with the upper half of the former spotted with light purple, precisely as in the male. The lip is rather elongated, and has the margin and apex somewhat crenulated. Its appearance is very interesting, as the other sex has been known for many years. It is a native of Monte Video. *Catasetums* now appear to be fairly common in gardens, and a few days ago the females of no fewer than four species were in my hands at the same time. Notwithstanding a general similarity, there are various points of difference when compared side by side, which will, perhaps, admit of their more satisfactory determination in future. *R. A. Rolfe.*

VANDA CERULEA, BURMESE VARIETY.

The old *Vanda cerulea*, so long known in gardens, is well known to be a native of the Khasia and Jyntea Mountains. A few years ago it was observed by Mr. C. B. Clarke at Kohima, on the borders of Manipur, and now it has been found in Upper Barmah, whence it has been imported by Messrs. Hugh Low & Co., of Clapton. A fine raceme of the Burmese variety has been sent to Kew by E. H. Woodall, Esq., of Scarborough, in which the flowers measure over 4 inches across their broadest diameter. The dorsal sepal measures 1½ inch across, and the petals 1½ inch. All are beautifully tessellated with lilac-blue on a paler ground, the lip being of a deeper purple-blue shade. The eastward extension of its range is very interesting, and quite in conformity with what is now known of the distribution of many other plants in this region. *Vanda cerulea* is very variable, both in size and colour, but the Burmese locality is said to have yielded some exceptional forms in both these respects. The one now to hand is certainly very fine, but I do not see how it can be separated by any distinctive character, owing to the range of variation previously observed in the species. *R. A. Rolfe.*

CATTLEYA LABIATA AUTUMNALIS.

Mr. F. Sander, of St. Albans, with his accustomed courtesy, has sent me various periodicals in which his remarkable re-discovery of the long-lost *Cattleya labiata autumnalis* has been mentioned. The last, which reached me to-day (September 25) is the *Saturday Review* of the 19th inst. In it are mentioned the known possessors of the old plant in England, France, and America, adding, "It is believed there are two in Italy." I have one of those two, and until quite lately another was in the collection of the gardens of the Municipality of Florence. But as I understand a large number of Orchids were sold out of it this summer, I do not know whether it is still there. Mine, as well as others which existed in Florence, were derived from the San Donato collection of Prince Anatole Demidoff. Mine answers to the description of *C. l. picta*, being of a deep red purple. It is now showing flower, the sheath having just opened, and is as described—double. I have also actually in flower *C. l. Warocqueana*. This has also a double sheath, only whereas in my *C. l. picta* the two sheaths are of equal size,

and intersect one another, in the *Warocqueana* they are unequal, one being within the other. The flower of my *C. Warocqueana* resembles more *C. l. Gaskelliana* than *C. l. autumnalis* vera. Another plant of *C. Warocqueana*, which has two flower sheaths coming on, has the sheaths single, like most *Cattleyas*. This may be that it has not yet gained sufficient strength, as otherwise the plant is identical in growth with the double-spathed one in flower. *H. J. Ross, Poggio Gherardo, Florence.*

ONCIDIUM CRISPEM LODDIGESII.

Here we have the original plant "fiores aurantiaci luteo-limbati, diametro tripollicari," as says Lindley in his *Genera & Spec.*, p. 197. These lines were written in 1833, and, in that interval of time, the plant quite disappeared from our collections. Several years later, in 1838, Messrs. Knowles and Westcott figured it in the *Floral Cabinet*, but what a reduced form in size and splendour! Now, we have the best form of it ever introduced. We received a flower about 3½ inches across; the petals more than 1½ inch broad; the labellum flat, and 1½ inch broad. The margin of all the petals, &c., is very regularly waved. The whole flower is deep brown, narrowly bordered with yellow, and with a radiating golden blotch at the base of the labellum. The wings of the column are the largest we have ever observed. The plant was introduced by Messrs. Sander & Co., St. Albans, and purchased amongst a lot of *Oncidium pratense* by Mr. Herbert Harris, Bowden Hill House, Chippenham, who is the *beatus possidens*. Considering the enormous size of the flower, one may be tempted to regard it as a variety, but as Dr. Lindley's diagnosis in all respects is the true description of the flower before us, we must admit that the old Lindleyan plant is re-discovered. The re-discovery of the *Cattleya labiata* vera is the event of the day in the Orchid world, and here we have a quite analogous case. The strange fact that the good old plant disappeared so quickly that only reduced forms remained, may be explained by its scarcity in its home, and even under the recent large importations of *Oncidium pratense*, only this single specimen has been found. *Dr. F. Kränzlin.*

MR. DREWETT'S ORCHIDS.

A short time ago, I happened to be in the vicinity of Riding Mill-on-Tyne, and it occurred to me that a few hours might well be spent in paying a visit to Mr. D. O. Drewett's renowned collection at Willow Wood. Owing to the kindness of Mr. Keeling, the gardener, I had every opportunity of seeing the Orchids. *Cypripediums* apparently are Mr. Drewett's favourites, and the plants are extremely well grown, and although there were but few in flower at the time, it was interesting to notice the ripening seed-pods on many of them. Some fine hybrids have already been raised in this collection, and some others will appear in course of time, and probably cause some amount of sensation in Orchid-loving circles. A specimen plant of *C. Lowii*, which had just finished flowering, could not but attract attention, and Mr. Keeling informed me that it had borne the large number of seven flowers on one scape, which exceeds the number on Mr. Douglas's plant recently shown at the Royal Horticultural Society, by one flower. *Visitor.*

MORPETH HOUSE, IPSWICH.

C. Whitfield King, Esq., is to be congratulated on the rapid progress which he has made in laying out the above place, of which he is the proprietor. It is only a few years since when the site on which this residence now stands was a hilly field; this state of affairs, however, has been entirely changed, and, thanks to the gardener, Mr. Southgate, we have now one of the prettiest and best kept gardens in Ipswich. Rockeries are to be found well stocked with good alpine plants and dwarf-growing shrubs. Herbageous borders are prominent features, and the varieties of *Helianthus*, *Dahlia*s, and other large bloomers give a gay aspect to the garden. Mr. King is a thorough enthusiast in matters horticultural, and his collection of Palms, Ferns, and Orchids is by no

means a meagre one. Notable amongst the Orchids was a well-grown plant of *Cattleya superba*, a very fine variety, which annually throws a flower-spike of seven flowers; and *Cypripedium insigne*, with from forty to fifty growths, making a grand display. Large specimen plants of *Cœlogyne cristata* also promised well for blossom. A good plant of the true *Lælia anceps Williamsiana*, which Mr. Southgate informs me is a pure white flower, and very handsome, is throwing two spikes which promise well for a good show about Christmas time. Many of the Orchids originally belonged to Mr. Philbrick, and are therefore somewhat historical. Other Orchids in flower were *Oncidium varicosum Rogersii*, a large branching spike; *O. unguiculatum*, *O. tigrinum*, *Dendrobium Phalænopsis*, *Cypripedium Harrisianum*, a good form; *Lælia Boothiana*, or as sometimes called, *Cattleya lobata*, was well in flower, and though it is the first that I have seen, I should imagine it to be a fine variety; the sepals and petals of a

plants in flower were noticed a few nice pieces of *Cypripedium Dominianum*, a graceful hybrid, with soft yellow flowers and dark lines; a splendid variety of *C. Harrisianum*, *C. Sedeni*, the little known *C. albanense*, with beautiful rose-coloured flowers; and several plants of *C. Godefroyæ* and *C. Veitchii Demidoff var.*, which struck me as being well grown, as did also a few plants of the well-known *Cœlogyne Massangeana*. There were several *Maedevallias* in bloom, and amongst them the rare *M. Gaskelliana*, shown a short time ago at the Royal Horticultural Society. *Cattleyas*, *Dendrobes*, *Lælias*, *Calanthes*, &c., were all well represented, and some amount of space was occupied by a recent importation of *Angræcum sesquipedale*, near to which it may be mentioned were a few specimens of quite a new species of *Angræcum* recently discovered. The plants of this latter unfortunately had suffered severely in transit; but time and care will no doubt bring them round. *Visitor.*

bad condition, so much so that he hesitated whether to root them out, or try and resuscitate them. Deciding on the latter course, he had them carefully lifted, made a new shallow border less than 18 inches in depth, and replanted them. They commenced to improve at once, and have continued annually to do so. Undoubtedly they have now reached the height of perfection, and during my fifty years of experience, I have never observed more highly-finished specimens. In a house adjoining the Muscats there is a grand lot of Mrs. Prince Muscat and Black Alicante, very fine in every respect, and the former variety uniform in the size of the berries, which, with this variety, is not always the case.

Figs in pots are unusually well done here, the fine bushes occupying 12 and 16-inch pots are loaded with fruit; the variety grown is Lee's Perpetual. Tomatoes are largely grown, the plants being in 10 and 12-inch pots, and the crop is a wonderfully fine one, many of the fruits weighing nearly 1 lb.; the favourite variety is Trophy. In one of the plant-houses there is a very grand plant of *Lapageria rosea*, literally covered with the darkest and richest-coloured flowers I have ever seen. Ferns, including *Adiantum cuneatum* and others are excellent, planted out on rockery banks, a plan much to be recommended, as nothing so fine as these can be grown in pots. A remarkably good plant of *Passiflora princeps* covers the roof of this fernery, and is almost perpetually in flower.

The kitchen garden contains excellent crops of Seakale, Celery, Brussels Sprouts, and Artichokes, the latter very fine heads. Wythenshawe Garden is famous, in the district, for its Apples, but this season the fruits have dropped prematurely, owing to the imperfect ripening of the wood last autumn and the ungenial weather at the time the trees were in bloom. Pears on the south walls are carrying good crops. There was a splendid lot of *Chrysanthemums* to be seen, with well-ripened wood and fine bright foliage to the pot's edge, promising a good harvest of flowers. The plants are not overfed—as we often see them. *H. Ellis, Bowden.*

FIG. 52.—CONE OF CEDRUS DEODARA.

rich rosy tint, and fairly broad, and the labellum of a dark crimson, with darker stripes, and similar in form to *C. crispa*, but twice as large. A large specimen of *Cattleya Gaskelliana* had seven flower-sheaths, and, though late, it is nevertheless very acceptable. *Cattleya Loddigesii* and *C. guttata Leopoldiana* are also in flower. Plants of *Odontoglossum grande*, a species which is grown in large quantities, are now full of spikes; *Odontoglossum* are represented by fine clumps of *O. Alexandræ* and *O. Pescatorei*. In conclusion, it may be safely said that this is going to be one of the best gardens in Suffolk. *Homeless.*

ORCHIDS AT SOUTHGATE.

The small establishment of Messrs. W. L. Lewis & Co., Chase Side, Southgate, is worthy of a visit from those who desire to obtain a cool-house specimen. Here may be seen many species, which one generally associates with high temperatures, grown where the warmth seldom rises above 60° or 65° Fahr., and to all appearance they are quite as healthy as the same would be if grown warmer. Among the

WYTHENSHAW HALL, NORTHENDEN, CHESHIRE.

CALLING at the gardens of this interesting old place, the seat of Thomas E. Tatton, Esq., a few days since, I was pleased to find many things so well done that I considered them worthy of note.

Mr. W. Neild, the gardener here, has for several years past been famous for his productions of Muscat of Alexandria Grapes, and this season is no exception, for they are at the present time splendid, fine in bunch, berry, and colour, the latter of that rich amber shade, which always accompanies high flavour. The house in which they are cultivated is of lean-to form, the length of the rafters 16 feet; each Vine is allowed to carry twelve bunches, the larger of which are from 12 to 13 inches in length, and from 8 to 9 inches across the shoulders, and about 4 lb. in weight. These Vines have been planted something like thirty years, but at the time Mr. Neild took charge they were in a very

CEDARS.

The cones of the Deodar are still so rarely produced in this country, that we are glad of the opportunity afforded us by Mr. Herrin, of Dropmore, of giving an illustration of it and one of the Atlas Cedars, fig. 53, for comparison. These two forms, with the short-leaved variety from Cyprus, are so intimately related to the Lebanon Cedar that Sir Joseph Hooker, many years ago, considered them to be all referable to one and the same species, and in a broad sense he was no doubt correct. They were in all probability all derived from the same original stock, although the differences are now so defined, that for all cultural purposes the three mentioned must be considered distinct. The cones of *C. atlantica* are always, so far as we have seen, of neater outline, the scales more compact and uniform at the edges, and the cones more depressed at the apex. Of all the forms, the glaucous form of *atlantica* is that which is most desirable as a cultivated tree, though it is too soon yet to know whether either the Deodar or the *atlantica* will rival the Lebanon in majesty and variety of habit.

THE AFRICAN OIL PALM IN BORNEO.

In the number of the *Kew Bulletin* for November, 1889, attention is drawn to the fact of the African Oil Palm (*Elais guineensis*) having been so far back as 1877 successfully introduced into Labuan; and in 1878, about 700 trees were reported by the acting Governor as being in a very healthy condition. Nothing having been heard of these plants since 1878, inquiry was made from Kew to the Colonial Office in 1889, and from the Colonial Office to the acting Governor of Labuan, which brought the information, that the plants which were raised on the island of Daat in due time produced nuts, but no attempt ever seems

to have been made to prepare oil from them, or to utilise them in any way, and in 1888 the Palms are reported to have been all removed to make room for Cocoa-nut trees.

The following paragraph, under the head of "Palm Cultivation in Sarawak," appears in the *Planters' Gazette* for September 2, copied, it is said, from a recent number of the *London and China Telegraph*. The information it contains evidently bears on the same subject referred to above, though the two accounts do not by any means tally:—"Some twenty years ago, a portion of the estate which was owned by Lady Burdett Coutts was planted with some West African Oil Palms. The land was very poor, and the estate was sold for a small sum to a Chinaman, who confined his attention only to the Pepper Vines. Years afterwards, the Government arranged to try and make something of the Palm trees which still remain on the estate, choked with weeds and neglected; so five years ago a party of four men were put on to keep the ground clean, collect the nuts, and gradually enlarge the estate by further planting. The accumulations of nuts during the past five years, having become large, these have just been worked up, and the yield from the 400 Palms which are bearing amounted to 1200 gautangs, or 70 piculs of good oil. The difficulty now is to find a market for this, as in Singapore it is not inquired for; but samples have been sent to England and Australia, where there is a great demand for the manufacture of soaps, and as a lubricant for railway-carriage wheels. There are now 40,000 young Palms on the Quop estate planted out, in addition to those in the nurseries, and as they bear at from five to six years of age, it is certain that the experiment, having been thus far successful, is well worth prosecuting further, in view of the trade which should arise in future in this product."

FLORISTS' FLOWERS.

CACTUS DAHLIA ANNIE HARVEY.

AMONGST Cactus-flowered Dahlias, the above variety stands out one of the showiest, the colour being bright rich crimson-maroon; added to this fine tint, the profusion of its flowers makes it still more valuable. *E. M.*

THE GLADIOLUS.

Cross-breeding has been difficult during the late wet weather, the pollen grains and the stigmatic surface being mostly in an unfavourable condition—at least, in the south—up to September 9; afterwards, bright sunshine, with a maximum temperature of 75° to 80°, was exceptionally favourable for fertilisation, and was doubtless taken advantage of by those to whom the raising of seedlings is a most interesting operation. So essential to success is warm and dry weather, that I have noticed on long spikes of seed-pods many capsules without a good seed, or with a few imperfect ones, when the weather had been rainy and cold for two or three days together. When the weather is fine, the pods fill up rapidly with seeds. I generally touch a stigma with pollen two days in succession—in the forenoon, and in the early part of the afternoon. Seedlings should be grown where they will be exposed to the light. If the seeds germinated in pots in a cold frame, the plants will be of good size, and ought to form nice bulbs before the leaves fade. As these become yellowish, water must be entirely withheld, as unless the soil be quite dry the bulbs will quickly start into growth. It is perhaps the best way to turn the bulbs out of the soil, and keep them in dry sand until planting-time.

The flowers of Gladiolus opened splendidly, and the late-flowering spikes were better than those which showed in August. How very different are the flowering conditions in the south of England to what they are in Scotland. When there, I had an opportunity to visit the nurseries of the celebrated

Scotch growers, Messrs. Stuart & Mein, at Kelso. The first thing that I noticed there was the healthy look of the collection, not a diseased plant being observed anywhere. With us it is different, our stock of plants often showing unhealthiness, and the imported corms do not always throw such good spikes as we should like. The arrangement adopted by Messrs. Stuart & Mein to protect the spikes from the weather, was excellent, withal simple. Two light boards, a yard or so in length, were joined together in the form of a triangle; to the third side a square of glass was fixed; the spike is tied so that the flowers face the glass, with a light deal board on either side. Some protection is absolutely necessary to keep the flowers fresh for exhibition, and this is certainly the best I have ever seen. Those who still wish to exhibit choice spikes at exhibitions, must afford water at the roots, if the soil be dry; but if the spikes are cut, or they are not required to be grown to the utmost limits, water may be withheld, and the ground well stirred between the plants. I find this helps the ripening of the corms. If a space of ground can now be prepared for next season, it will be preferable to trenching and manuring it in the winter. The late M. Souchet, who did so much to bring the Gladiolus (hybrids of *Gandavensis*) up to their present state of excellence, left the ground in fallow for one year before planting the roots. This system of culture is adopted by other growers with equally good results.

THE HOLLYHOCK.

This flower was well represented at the late Royal Caledonian Horticultural Society's exhibition, the spikes from Messrs. Alex. Kerr & Sons, Roxburgh, being excellent, and not much behind those sent by Messrs. Stuart & Mein. Roxburghshire seems to be the northern home of the Hollyhock, for all the largest spikes and the best blooms came from that county. When at Kelso, I had the pleasure of looking over Messrs. Stuart & Mein's collection, and I can truly say that I never saw better furnished plants, the deep green leaves reaching to the base, with not a trace of the dread disease. Mr. Mein was good enough to say that he had followed the instructions which I had given in these pages more than once, as to propagating from eyes taken from the lateral growths, and he pointed out to me about 1500 plants in small pots which were raised in that manner, and these plants are of even more value in Scotland than they are in England, for in the South we have no difficulty in flowering the spring-struck cuttings in time, but in the North, the late spring cuttings do not flower until very late in the season. Wherever early bloom is required, the summer-struck cuttings from eyes are best. I noted a few of the very best in the collection at Kelso: Queen of Yellows, a superb variety, is certainly the best of the rich deep yellow-coloured ones; Hercules is still the best of its colour—it is yellowish-buff; Octoroon is a fine purple flower, with a maroon or crimson tinge; Pride of Layton is reddish-buff, with fine compact centre, and good guard petals; Agnes Berry is of a primrose tint, with some red in it—a fine compact flower; Favourite has a rosy-peach colour, the flowers are large and well formed; Purple Prince is a noble variety, with good guard petals; Mrs. Hunter, a good white variety; John Finlay, a fine full crimson; Cremonne, yellowish-buff, with a reddish tint; Peri, the best white variety yet raised—it is large and well-formed; Cygnet is another very good and very pure white; Lord Decies, a dark crimson, is a fine bloom; Fraok Gibb Dougall is a rich purple; Grace Darling is of rosy-red, tinged with buff. In about one month from the present it will be time to cut down the stems to within 6 inches of the ground, and the plants dug up and planted in 8 or 9-inch pots, placed in a frame well exposed to light, and well ventilated, there to remain until it is time to take the shoots from the base. These should be planted singly in sandy soil in small pots, and rooted in mild bottom-heat in frames, or in a forcing-house. As soon as the ground where they

are to be planted next year can be spared, it should be heavily manured with the solid farmyard dung, and trenched, moving the soil well about whilst trenching it. If the ground be heavy in its nature, this early trenching is of great importance, and the manure then employed should be from the stables. *J. Douglas.*

VIOLETS.

The obtaining of a good supply of bloom during the whole of the autumn and winter is a very important matter, and to do this the plants should be placed in their winter quarters as early as possible after this date. With care, early transplanting gives the plants a good time to get established before winter sets in, and the plants bloom freely. I plant them at the end of the month of August or the first week of September, and from these we are now able to gather some good blooms. By keeping the runners picked off, there will be no failure in the supply of bloom before the month of March. I may add that the lights are not made any use of, excepting when it rains heavily, till the frosty nights set in, so that the plants grow slowly, and consequently sturdily; and good soil is essential if large blooms are looked for. In bright weather, the plants should be well syringed over-head, so as to keep red-spider in check. Marie Louise is the best Violet for frames, although the flowers may not be so sweet as the Neapolitan. There is one more matter that is observed here, the plants are not put too near to the glass, so that there is no loss of foliage from damp, which is sometimes believed to be a kind of disease. If the leaves are 8 inches from the glass, and the frame is set at a steep angle, damp better makes its escape freely, and the glass and the plants keep dry and warm. *H. Markham.*

ROSERY.

FOUR GOOD NEW CLIMBING ROSES.

The following are four Roses of recent introduction that are already taking a high position among climbers, *i.e.*, with all growers who know them; it is my object to describe these briefly, and bring them before the notice of your readers:—

BRUNNERT FRIDOLIN.

Introduced by A. Bernaix in 1889—a most charming Rose, of quite a new colour; bright cherry-carmine, shaded deeper, and with a lighter spot in the centre of each petal. Form perfect, of fair size, and a grand climber under glass.

CLIMBING NIPHETOS.

Sent out in the same year as the above; this is the finest white climbing Rose grown. This grand Rose is in every respect similar to the well-known Niphetos, except in being a remarkably strong and vigorous grower. The flowers are produced in great abundance upon laterals from the whole length of the longer shoots, which reach from 15 to 25 feet in length.

KAISERIN FRIEDRICH.

also sent out in 1889, is a cross between Gloire de Dijon and Perle des Jardins. This is one of the most unique-coloured climbing Roses we have, while in habit of growth and freedom of flowering it is quite as good as the old Gloire. Colour, a deep saffron-yellow, lighter in the centre, with the out-sides of the petals finely tipped and splashed with bright and soft rose-tints. The outside of this Rose is very similar to Marie Van Houtte in the late autumn, and all who have seen M. V. Houtte at that time of year will remember the exquisite shadings.

HENRIETTE DE BEAUVEAU.

Introduced by Lacharme in 1887; very bright, clear yellow, same shade as a good bloom of Perle des Jardins; flowers most perfect in shape, produced very freely; sweet-scented. It is one of the finest yellow climbers grown.

The four Roses named are extra good when grown on a warm and sheltered south wall; also under

glass. I have tried them in both situations, and can say with confidence that they are worthy of first place among all climbers of this beautiful flower. A. P.

FRUIT NOTES.

PLUMS.—Belle de Louvain does not appear to be much grown, nor is it mentioned in Hogg's *Fruit Manual* (old edition), although I see it in Veitch's catalogue, where it is described as follows:—"Large and handsome, purple; it makes a fine free-bearing pyramid, cordon, or wall tree—very valuable for culinary purposes." It would seem, therefore, from the evidence of Mr. Ward's trees, and what is said or copied above, that Belle de Louvain is a most desirable variety, and planters will do well to take note, and add it to their lists. Rivers' Early has an established reputation, and is grown largely for market; but now that the foreigners come in, sales of it must be affected to a great extent, and probably later varieties will be more profitable. One of the

and those facing west. The same also applies to Coe's Golden Drop, which requires plenty of sun to finish it off; and when it attains its true yellow colour, it is exquisitely flavoured, and unrivalled during its season of ripeness. Jefferson's, too, is much improved by having a position where it can be exposed to the solar rays for at least half the day, an east or west aspect suiting it well. Reine Claude Violette is a most delicious Plum, as when well ripened and caught right, it is a perfect sweetmeat; and the same may be said of Reine Claude de Bayay, which is also valuable for its lateness, as it is one of the last to come in. The latest with us is Quetsche St. Martins, which hangs on until the middle of November, and for the season is very good; the fruit is medium-sized, oval, and yellow, partly covered with russety-red on the side next the sun.

As regards standards, those most heavily laden this year are, as usual, Victoria, which, however, in our garden and in others, is subject to fungus in the leaf—so much so, last year and this, as to become partly defoliated before the fruit was ripe, and the

Bunyard & Co. have now worked up a stock of it, and other nurserymen are following in their track. Grown under glass, we find it in season with Sea Eagle, but of better quality than that variety. It is large, reaching 10 inches in circumference, bright lemon-yellow in colour, suffused and streaked with crimson on the sunny side, and it is an attractive fruit on the dessert dish and exhibition table. Its flesh is very juicy, melting, and the flavour piquant; while the tree is hardy, and a good grower. Altogether, I consider this to be the best Peach in its season. Thomas Coomber.

NATURALISATION OF EXOTIC FOREST TREES IN PRUSSIA.

THE Forest Academy of Prussia between 1881 and 1890 distributed an immense quantity of the seeds of trees, furnished almost entirely by our distinguished countryman, Mr. John Booth, formerly proprietor of the celebrated nurseries at Flottbeck. Experiments have been made with twenty-two American and six Japanese species, as well as with *Pinus Laricio* of Corsica and Nordmann's Fir of the Caucasus. The experiments will be continued on a large scale in future with the following selected species only:—*Pseudotsuga taxifolia* (Douglas Fir), *Picea sitchensis*, *Chamaecyparis Lawsoniana*, *Thuja gigantea*, *Quercus rubra*, *Juglans nigra*, *Hicoria ovata*, and *H. minima*.

A second class, composed of trees which promise only a partial success, is reserved for less extended trials. It is composed of the following:—*Pinus rigida*, *Juniperus virginiana*, *Abies Nordmanniana*, *Pinus Laricio*, *Acer barbatum*, *Betula lenta*, *Hicoria alba*, *H. porcina*. The following trees have been rejected entirely:—*Pinus Jeffreyi* and *P. ponderosa*, *Acer saccharinum* (*dasyacarpum*), *A. macrophyllum*, *Hicoria sulcata*, *Fraxinus pubescens*. In place of the last it is now proposed to try *Fraxinus americana*.

Of all the new introductions, which consist principally of Conifers, the Douglas Spruce appears destined to occupy the first place. Nothing but praise is heard for it. The seed of none of the other exotic trees has been distributed so generally and so profusely in all parts of the country, from the north to the south, and none of the others has given such brilliant results. Immense quantities of the seed of this tree are now planted in all parts of Germany, and the supply is not commensurate with the demand. This splendid tree, therefore, has the best chance, if not of replacing our indigenous Conifers, at least of placing itself on a par with them in the composition of our forests. Its success seems to be assured in all parts of the kingdom, even in the far provinces of the north-east where the cold is extreme. Not particular as to soil, it thrives everywhere except in low peaty swamps and on the moving sands of our maritime provinces. The Douglas Fir is one of the best presents which have been made by the New World to Europe. The publication to which I have referred devotes itself especially to discussing the differences between the so-called Red and Yellow Firs, races which seem to mingle in this country in the general success of the species.

The Douglas Fir has for a close second the Sitka Spruce, which is also very promising, although it grows less rapidly than the Fir; and we expect to see this tree of the Pacific coast occupying some day or other immense tracts of the German Forests, especially in those peaty soils where the Douglas Fir refuses to flourish.

Lawson's Cypress, that ornament of gardens, is valued for the solidity of its wood and for the ease with which it adapts itself to soils of the most variable character. What I think will surprise you is the hardness of *Thuja gigantea* (Lobb's Cypress) in the extreme north, even to the very confines of that eastern Prussia which at Berlin has come to be considered the vestibule of Siberia. It is needless to say that, as it flourishes in that inhospitable region, the parks and gardens of Brandebourg, in a more temperate climate,

FIG. 53.—*CEDRUS ATLANTICA* (SEE P. 423.)

best of these is Autumn Compôte, which is fine and handsome, and of first-rate quality. Grand Duke and Archduke are both valuable late kinds, and being large and showy, as well as of high quality, are suitable for exhibition. Jefferson is a grand Plum, as it is good at all points, and one of the best introductions we have ever had among Plums. The Gages Late Transparent, Brahys, and Bryanstone are likewise desirable in any collection where a long supply of high-class fruit has to be kept up for culinary purposes, and any of the above-mentioned do well as standards or pyramids. Where quantities are required for cooking, Prince Englebert and Prince of Wales should be planted, to help supply the demand, as they are large and free-croppers; but Washington, though fine, is shy when grown as a standard, and is hardly good enough for a wall. One of the very best for this purpose, and for furnishing rich dessert fruit, is Kirke's, which should be in every garden; but to have it at its best, the tree must be on a good aspect, as I find there is a very great difference in the size and quality of the Plums gathered from walls having a south-eastern exposure

fungus affects the wood, making it brittle. This disease seems to be more common with trees in light than in heavy land. J. S.

THAMES BANK PEACH.

Perhaps I ought to apologise for trespassing upon space to refer to this fruit, as I have written previously, upon more than one occasion, with a view to draw attention to its merits. It is still, however, comparatively little known, although raised by Mr. Rust upwards of a quarter of a century ago. Why it has remained almost obscure for so long a time, when other varieties have become popular, that cannot approach it from various points of value, it is difficult to comprehend, unless it is that it has yellow flesh. Some cultivators, and consumers too, are prejudiced against yellow-fleshed Peaches, as others are to scarlet or white-fleshed Melons. Only the other day, I was recommending this Peach as a late variety, and on mentioning its type, received in reply:—"I do not like yellow-fleshed kinds." Some few years ago we found a difficulty in procuring trees of this variety, but Messrs. Geo.

are now enriched with the tall stems of this superb plant, which passes uninjured our most severe winters. Even this last one of abnormal severity and length has not affected it in the least.

Pinus Jeffreyi and *P. ponderosa* have been struck out from the list of trees available for planting in the neighbourhood of Berlin, although there is still some hope that *Pinus rigida* may succeed here, this being the species which was believed to furnish the Pitch Pine of commerce, which is, however, probably produced by *Pinus mitis* or by *P. palustris*. That this communication may not be too long, I must not speak in detail of all the species which have been tried. The Black Walnut and the Hickories rarely find here soil suited to their needs, while the Red Oak succeeds admirably. This last, however, has been naturalised here for a long time, its introduction dating from 1740. Up to the present time, however, it has been grown as an ornament of gardens, and not as an inhabitant of forests.

I cannot leave this subject without expressing my thanks to Mr. Schwappach for his admirable essay upon the results of these forest-experiments. I shall take an early occasion to speak of the results of the experiments with Japanese trees in Prussian forest-planting. *C. Bolle, Berlin, in "Garden and Forest."*

NOTES FROM THE TRANSVAAL.

AFTER a long silence, the spring-time suggests a few notes on the vegetation of this far-off land, in which our people are settling in increasing numbers every year. The past winter here—S. lat. 26°, elevation 6000 feet above sea-level—has been a very mild one; only 2° to 4° of frost has been noted, as compared with 12° last winter. No snow has fallen, and I have seen but the merest film of ice. As usual, we have had no rain the whole winter, which extends from April to July. Young Orange and Lemon trees have lost their tips; old trees are bearing good crops of fruit.

Stephanotis floribunda on a warm wall is doing very well; *Passiflora edulis*, *Tecoma venusta* and *Jasminoides* the same; *Gardenias* planted out in exposed places have lost their leaves only; *Heliotropes* were killed to the ground in some places; *Acacia lophantha* dead; Indian *Azaleas* seem quite hardy, and *Camellias* and *Abutilons* are now in flower.

Of *Eucalypti*, *E. amygdalina*, *cornuta*, *robusta*, and *globulus* stand the cold best. *Grevillea robusta* loses its tips only. *Acacia dealbata* is now enveloped in a cloud of golden bloom—a beautiful and welcome sight. Almonds and early Peaches put forth a few flowers, and appear quite indifferent to slight frosts.

First amongst the native flora to respond to the increasing power of the sun is *Buddlea salviaefolia*, with its beautiful pendent corymbs of lilac-white flowers, with their delightful honey scent. Beneath the long narrow leaves of *Moraea polyantha* begin to show, followed by yellow and brown-spotted Irid-like flowers. Along with it is an *Albuca* about 1 foot high, with a white cluster of blooms intermixed with the graceful feathery foliage of species of *Asparagus* clad in richest green—some climbing, others herbaceous. *A. plumosus* does not extend to this locality. A little later a splendid orange-crimson *Hemantus* suddenly appears, and by November the copious rains have called up a host of interesting plants.

A fine pale purple Composite, *Callilepis* sp., is well worthy of cultivation, and would make a good companion plant to the fine scarlet *Gerbera Jamesoni*. A small, but intense crimson *Striga* is quite common. This lovely little *Scrophulariad*, I believe, is a parasite on grass roots. That fine Composite, *Dicoma Zeyheri*, also grows amongst the grass; in size and colour it nearly resembles the Cape Everlasting Flowers (*Helichrysum vestitum*), but its rays are hard, prickly, and persistent. Beneath the shade of that very handsome shrub, *Rhamnus prinoides*, whose foliage reminds one of *Escallonia macrantha*, is found the

beautiful scarlet *Anomnthea grandiflora*; whilst fully exposed in the open we find *Babiana Bainesii*, flowers purple and white, sweet-scented; also the very handsome white and brown-flowered *Trichodesma physaloides*, as unlike a *Borage* as possible. I have observed a single colony of *Nymphæa stellata* with lighter purple flowers than the Natal variety. *Crinum capense* is sometimes met with, ranging in colour from white to deep rose and purple. We have a splendid rosy *Brunsvigia*, with bulbs the size of a football. The true *Richardia africana*, strange to say, is absent, but we have a nearly allied plant with small ivory-yellow spathes.

Around Pretoria, Heaths and Ferns are very rare. Amongst strange plants may be singled out a *Stapelia* with wonderful black, musk-scented flowers, and a white and black dotted *Gomphocarpus*. Epiphytic Orchids are absent; but *Bonatea speciosa*, or a variety very near it, is sometimes seen.

Amongst rocks a *Protea* is common; and a remarkable *Amaryllid*, *Vellozia* sp., with a stem 2 to 4 feet high, narrow, drooping grass-like leaves and lilac flowers.

The above imperfect list gives a faint idea of our very varied and interesting flora. The condition of the Transvaal is fairly prosperous. Our gold out-put is over 2 tons a month. In less than three years we hope to be connected with the Cape and Natal Railway system, by which the cost of living, which at present is high, will be reduced. May I add, for the information of correspondents, that having pitched my tent near that happy hunting-ground, the Magaliesberg, I trust to resume collecting shortly, after an interval of two years. *R. W. Allam, Pretoria, Transvaal, August, 1891.*

TREES AND SHRUBS.

ORNAMENTAL CRAB JOHN DOWNIE.

I HAVE received, from the Kuap Hill Nursery, a specimen of this extremely ornamental Crab, which is finer than I have ever before seen it. Mr. Anthony Waterer says it is one of the finest things he has in his nursery at the present time, and he thinks very highly of it. The shoot sent is about a yard long, and carries over thirty fruits, about the size of a Walnut. The fruit is conical, with a distinct nipple around the eye; the colour is yellow flushed with crimson on the side, and has quite a wax-like look. The stalk is slender and 1 inch long, so that the fruits hang down. The foliage is large and vigorous, which indicates a strong-growing tree. It must be a very ornamental tree for a lawn, though the temptation to a schoolboy may deter some from planting it in public places. The fruit is acid, but not astringent, and would make a good preserve, no doubt. It is now obtainable in most of the large tree nurseries. *W. G.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

THE FLOWER BEDS.—The continuance of heavy rain in many parts is almost as damaging to the flowers in the beds as frost would be, and it is advisable to pot up such choice varieties as Mrs. Pollock and Golden Harry Hoyer, planting in their stead Wallflowers, Arabis, &c., so that there shall be no blank spaces or beds. It is convenient when the weather admits of this method of procedure being followed, inasmuch as the necessary number of plants of the several sections of last year's striking can be boxed, removed, and preserved for another year. I may say that the verges and spaces of turf between the beds should be mowed before clearing and replanting them.

HARDY FERNERIES.—Examine hardy Ferns, and remove any leaves that may have become disfigured by thrip or other cause, but preserving all others; and pulling up weeds. Thin out the carpet of Ivy and Periwinkles where these plants have become too thick together. The mixture of the green, bronze,

and yellow fronds of the Fern are both effective and seasonable now.

WALKS.—Gravel and turf walks must be kept free from weeds, moss, and leaves, advantage being taken of moist weather to weed them, and roll the weeded walks directly after the work is finished. Smith's weed-killer is a simple, effectual, and economical preparation for destroying weeds and moss, but care is necessary in its use, lest it should come in contact with live edgings; and, owing to its poisonous nature, it should not be applied to walks or drives which are frequented by pigeons or poultry. This weed-killer should be used when the weather is dry, and at the rate of 1 pint to 4 gals. of water. One good dressing will keep the walks free of weeds and moss for twelve months, if not for a longer time.

WORK TO BE DONE: ALTERATIONS, PLANTING, ETC.—All ordinary work should be pushed on with, in order to proceed as soon as may be, with alterations and improvements, such as extending the ornamental grounds, preparing borders and beds for shrubs, &c., and the planting of the same, trenching and manuring the ground for herbaceous borders, and, where necessary, putting in drainage; preparing new beds and borders for Roses, and any other work of this kind. *H. W. Ward, Longford Castle, Salisbury.*

THE KITCHEN GARDEN.

FRENCH BEANS.—Plants in pits should now furnish a supply of pods, and where these are in heated pits there will be no danger from damp; on the other hand, when sun-heat is relied on, or that of dung linings, much care will be required in affording water, which should always be a few degrees warmer than the air of the frame, and the watering done in the forenoon, thus allowing time for damp to be dispelled before closing time. French Beans in warm pits will need frequent syringing to check red-spider. A sowing may now be made in pots, three-quarters filled with a compost of loam, leaf soil, and spent Mushroom-bed dung, placing six or eight seeds in each, and setting the pots in a warm place to germinate, and when the plants are 2 inches high, keeping them close to the glass. Remove two or three of the weaker plants in each pot, and, when the plants have made plenty of roots, top-dress with the same kind of soil, adding a little bone-meal. Sow more seed at intervals of three weeks, for a constant supply.

RUNNER BEANS.—Gather all the useable Runner Beans, spreading them out thinly on a cellar-raft, or other cool damp place. Pods for seed should be gathered and laid upon shelves, in an airy house, to get thoroughly dry.

POTATOS.—The main crops should now be dug up, first pulling up the stems and burning them. Choose, if possible, a dry day for the job, and carefully sort out all the diseased tubers from the sound ones. If roomy sheds are at command, it is good practice to put the crop therein for a few days prior to storing or clamping. Look over the stores of Potato sets, and remove any that may be decayed.

CAULIFLOWERS AND AUTUMN BROCCOLI.—Means must be taken to protect these vegetables from frost, which may be done by using a little bracken or clean litter. Another way is to gather the leaves together and tie them over the head. If too many are turning in at one time, lift and heel-in the plants on a north border, covering them with mats when frost threatens. I find that Cauliflowers, &c., keep fresher in this way than when they are hung head downwards in sheds.

YOUNG CAULIFLOWERS may now be planted under hand-lights on well-matured trenched land, in the warmest situation in the garden, and unless the weather should be very wet and cold, the plants may be constantly left uncovered for the greater part of the present month. During heavy rains, put on the tops, but tilt them at the side. Prick out later-sown plants into cold frames, at a distance of 4 inches apart. *C. J. Waite, Glenhurst, Esher.*

THE HARDY FRUIT GARDEN.

The gathering and harvesting of Apples and Pears now demand attention from the gardener, many of the midseason varieties of both being now quite ready. Late varieties should be left on the trees for some time yet, as these will not only increase in size by so doing, but acquire a much finer flavour, and keep with little or no shrivelling. Midseason fruits should be gathered if the seeds have become

brown, and the fruits part freely when but slightly turned upwards. Too much care cannot be taken in handling the finest fruit, always placing it in a single layer in the basket, and keeping bruised specimens apart. There should be three different sizes made, the largest for cooking purposes, the medium and best-coloured for dessert, and the small and damaged fruit for immediate use. If the wood of which the fruit shelves or racks are made is free of all smell of turpentine, and clean, place the fruits in a single layer; clean paper or straw, are better than hay on rough boards, as they impart no bad flavour to the fruits. The gathering should take place when the fruit is perfectly dry, and it should be afforded plenty of air all day and night till the sweating period is past. The Apple keeps best when stored in a very cool room, so long as frost does not penetrate it; and in the case of large quantities, the fruit may be placed several layers thick; Pears should, whenever possible, be kept to one layer, and in a dry place, with a higher temperature than the Apple needs, or the flavour of the fruit will suffer.

BLACK CURRANTS.—Where the bushes are very crowded, cut out many of the older branches, reserving much of the young and fruitful wood. With yearly attention, Black Currant bushes may be kept in a fruitful condition for many years, the berries being larger and more plentiful. The same may be said of Gooseberries, which should be pruned in a somewhat similar manner. Cuttings of bush runners may now be made and put in, which will root with certainty and make nice bushy plants the first year. In putting in the cuttings or slips, see that they are made very firm in the soil, and the bark is not allowed to shrivel previously.

STRAWBERRIES.—These have made fine growths hereabouts, and the crowns promise well for next season. Keep the beds free from weeds, the hoe being applied if no mulching has been used. Young plants put out early should be freed from runners, and the beds put into neat order. *H. Markham, Merce-worth Castle, Maidstone.*

PLANTS UNDER GLASS.

THYRSACANTHUS RUTILANS, LIBONIA FLORIBUNDA, ERANTHEMUMS, AND LINUMS—These plants, which may have been growing in cool pits or frames, should now be removed to warmer quarters; and as their pots fill with roots, afford them clear manure-water at weekly intervals, and be careful not to let the plants suffer for want of water.

GESNERAS which have been properly grown, will now be found very useful in the decoration of warm houses, the foliage in the case of *G. zebrina*, and others velvety in texture, making nice effects when the plants are intermixed with others. Fumigate them frequently in a light way to keep aphid and thrips in check, both of which are very partial to them; and to have the foliage in the best possible condition, it should not be syringed at any period of growth.

CACTUS EPIPHYLLUM TRUNCATUM.—These are very useful plants for the autumn and early winter, and where a sufficient stock is at hand, a portion of it may now be placed in a warm house, so as to produce blooms during the last half of the month of November. A succession Pine-stove or the Intermediate-house will suit them.

EUPATORIUM RIPARIUM AND E. WEINMANNIANUM.—Both of these plants will be showing for bloom, and should be placed in some light airy structure, so that the bloom may not get damaged by frosts or heavy rains. Eupatoriums flower best when pot-bound, and as they root very freely, it is essential for the preservation of the foliage that they should not lack water at any time; and occasional doses of manure-water are beneficial.

CHRYSANTHEMUM FRUTESCENS.—By putting in a batch of cuttings at the present time, this plant will make useful decorative material in the months of spring. Cloth of Gold (yellow), and *C. Halleri maxima* (white), are very good varieties for pots. In choosing the cuttings, select the strong shoots with short joints; at the same time, be careful that the base of the cutting is tender, or it will not quickly root. When required for growing in pots, I prefer to strike them singly in small pots, in a compost consisting of sandy loam. They are placed in a cool frame, and kept close till roots are formed, which will be in two to three weeks after insertion. The best place for wintering these plants is a low pit, in a temperature that does not fall below 45°. Keep them close to the glass, or draw-

ing will take place; and when well-rooted, pinch out the leading point, so as to form the framework of the future plant. Shift into 5-inch pots when they have commenced to grow, and when 2 or 3 inches of growth have been made, again stop the shoots, which will give the required number to furnish the plants by the time they receive the final shift. Afford plenty of air on all favourable occasions; and keep them free from aphid, wetting them by frequent syringing, or failing this, dip the plants in some kind of insecticide.

CHRYSANTHEMUMS.—Preparations should now be made for housing the plants, in view of the imminence of frost, and whatever kind of house the plants are to occupy, and especially if other plants occupy it that are liable to be infected with aphid, it should be well fumigated, and the glass cleaned. Before housing them, have each plant examined, and should there be the slightest trace of mildew on the undersides of the leaves, lay them on their sides, and syringe the foliage with a mixture of lime and sulphur, thoroughly wetting all parts; see also that the drainage is satisfactory, and all decayed leaves as well as side-shoots picked off, and all dirt washed off the pots. The watering of the plants should be done early in the day, and water should not be slopped about the house; admit plenty of air on all favourable occasions. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

THE COOL HOUSE.—Plants of *Oncidium Marshallianum* which may have large growths, will require to be well ripened, or they will not afford satisfactory flower-spikes; and to do this, place the plants in the full sun, and do not allow them to become dry. *O. varicosum* and *O. Rogerii*, which may have been grown in the cool-house in summer, will now open their flowers better if the plants receive a little more heat. The Intermediate-house suits them at this season, and during the winter, *O. macranthum* is one which may receive the coolest treatment. Some four or five years since, I called upon an amateur at Dulwich one frosty morning, and to my surprise I found the Orchid-house door standing wide open, and just inside the house, on one of the stages, was standing the grandest lot of *O. macranthum* which I ever had seen—above five dozen large plants. Strong and healthy plants should now be showing their flower-spikes, and it should be remembered that these form tasty morsels for slugs, and great care is needed to prevent injury, or the work of a whole year will be lost in a night. Fresh traps should be laid nightly, and examined at night by lantern-light; fresh slices of Potato, Carrot, or Turnip are good traps for slugs, as is moistened bran laid about the house in small heaps.

Few thrips will make their appearance at this season amongst the *Odontoglossums*, but aphid must still be searched for, or they will soon ruin the appearance of the tender growth. In some *Odontoglossum*-houses the plants are placed on a level stage; this style of arranging them should be avoided, by placing the plants on small elevated stages or inverted flower-pots, and not crowded, unless it be newly-imported plants, which may be arranged thus for a time. Any *Odontoglossums* requiring it, and that are not yet repotted, should be finished off forthwith. *Disa grandiflora* should be repotted without delay, new growth and roots forming as soon as the old growth dies. After repotting the *Disas*, place them in a frame, and cover with mats on cold nights. *A. G. Catt, Park-field, Hallow.*

FRUITS UNDER GLASS.

MELONS.—Melon growing for want of sunshine, has been difficult in some parts this year, and the fruits without much flavour. Great attention will now be required to ripen those fruits which remain. Last season it was stated in these columns that good-flavoured Melons could be cut in February, but I have never been so fortunate as to secure good ones then, or even in the month of October. Canker at the root is troublesome, and more so in beds than in pots, and it must be guarded against by employing powdered quicklime as soon as observed. For later fruiting large pots are best, the plants suffering less from the malady. A steady and sufficient bottom-heat at this season cannot be done without, and when pots are used a small quantity of well-prepared fermenting material should be placed around them, to be added to as required. The temperature by day may range from 75° to 80°, and 5° to 10° lower at night; the watering of the plant being performed

with care, the bine kept thin, and a little air admitted daily.

CUCUMBERS.—Efforts should be made to get the trellis covered with shoots and foliage. If fruits are required in the winter, the plants should not carry any fruits for some time to come; and when fruit is wanted at this season it is better practice to grow a few plants for the purpose, throwing them away at the end of the year. The winter plants may now receive a top-dressing of light rich soil, keeping the foliage from getting crowded. Syringe the plants daily in bright weather, and keep aphid, &c., in check, for if these are allowed a footing, they are difficult to be got rid of, and the plants get into bad condition in consequence. The day temperature may range from 70° to 80°, running up to 90° by sun-beat, and with abundant atmospheric moisture. The night temperature may be kept at 70°. Ventilate very sparingly in cold weather, keep the bottom-heat equable at about 85°, and avoid the use of fresh stable-manure, but prepare it by frequent turning.

TOMATOS.—The plants for winter fruits are now placed under glass—these are in 10-inch pots, and they have fruits set, and much bloom; the latter will require henceforth to be set artificially. Keep the plants near the glass in a dry airy house, and cool, for a time. In November greater warmth may be afforded the plants. Winter Tomatos require very little water if they are planted out, and only limited supplies while standing in pots. The shoot should be kept thinned, exposing the bloom to the sun. Keep a free circulation of air in the house, as a close moist temperature is often the forerunner of disease. Should green or white fly, or mildew appear, fumigate and sulphur the plants as may be required. Painting the pipes with sulphur and lime will do much in keeping mildew at bay. Cuttings in 60's should be potted, and kept near the light. These latter will be valuable to succeed the winter fruiters. *G. Wythes, Syon House, Brentford.*

THE APIARY.

THE PAST SEASON.—The year 1891 may, on the whole, be classed as an average one in regard to the yield of honey. Little or no surplus was produced from fruit, Hawthorn, and other early-flowering trees, as was evidenced by the almost entire absence of this year's honey at the spring shows; but bees in near proximity to Clovers, Lime trees, &c., were able to make up for time lost earlier in the season. Few complaints have been made of honeydew having been gathered to any extent, no doubt owing to the copious rainfall, which would have the effect of keeping the deposit washed from the surface of the leaves, aphids having been very prevalent, especially on Plum trees. Honey of specially good quality has been exhibited at the leading summer shows throughout the kingdom, and it is therefore safe to assume from this data that the general excellence of crop has been up to the mark. Heather honey has been conspicuous through its absence from the later shows.

NEW APPLIANCES.—Bee-keepers who have given the horizontal super-clearer or bee-escape a trial this season, speak of it in terms of the highest praise, and to be able to go to a hive in the morning, quietly lift up the section crate, under which place this appliance, and find that by the evening most if not all the bees have left the sections, which can then be removed without disturbance, is a great boon. Swarm catchers or self-hivers have met with but varying success at present; but it is evident that the idea can be improved on, so as to produce an article that will not fail to accomplish the desired result. A new machine has just been invented for extracting heather-honey from the comb, which is said to answer admirably. It is composed of vertical plates, with grooves about a quarter of an inch deep, and the same distance apart; a screw with a handle runs through the ends on each side for screwing them together. In operation the press is laid horizontally on a box lined with tin, which has two bars running across level with the top. The combs are cut out of the frames, and are wrapped in straining calico without being uncapped, and a piece of woven wire, about twelve meshes to the inch, is placed on each side. They are then placed between the grooved plates, and pressure brought to bear by turning the handles. The woven-wire prevents the combs from being forced into the grooves, and the pressure exerted forces the honey through the calico, so that it runs quite clear into the receptacle below, leaving behind an almost dry sheet of wax. *Expert.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY,	Oct. 12—	Eastbourne Horticultural Society.
THURSDAY,	Oct. 15—	United Horticultural and Benefit Society: Anniversary Dinner, Cannon Street Hotel.

SHOWS.

TUESDAY,	Oct. 13—	Manchester Royal Botanic Society: Fruit Show and Congress (four days).
WEDNESDAY,	Oct. 14—	National Chrysanthemum Society, at the Royal Aquarium (three days).

SALES.

MONDAY,	Oct. 12—	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms. Nursery Stock, at Woking, by Messrs. Protheroe & Morris (six days).
TUESDAY,	Oct. 13—	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids collected by Count Horace de Choiseul, at Protheroe & Morris' Rooms. Valuable Dendrobiums, at Protheroe & Morris' Rooms. Nursery Stock, at Cole Hill Nursery, Fulham, by Messrs. Protheroe & Morris.
WEDNESDAY,	Oct. 14—	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Azalea indica and A. mollis, and Camellias, at Protheroe & Morris' Rooms.
THURSDAY,	Oct. 15—	Established Orchids, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Oct. 16—	Valuable Dendrobiums, at Protheroe & Morris' Rooms.
SATURDAY,	Oct. 17—	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—51° 2.

The Chiswick Conferences.

Our conditional statements last week as to the prospects of the Show of Conifers and Asters at Chiswick, were unfortunately only too well justified. The exhibition, whether of Asters, Sunflowers, or Conifers, is remarkably good, and very extensive; but the weather—on the Tuesday and Wednesday—well, we have no adjective sufficiently forcible to express our disgust. We can only commiserate the officials of the Society and the exhibitors who did so much to render the Exhibition and Conferences successful, and to induce the public to visit the old garden, with its noble vinery, its abundant fruit crop, its trial grounds, and other features of interest. But not even the rain could damp the zeal of the exhibitors, and, as we have said, a fine show was got together.

If only on account of variety, the Conferences at Chiswick this week have been very remarkable. As they are still in progress at the time of writing, we can say but little of them in this place, but we may refer to the report in another column.

The groups of living plants are arranged in the open air in a simple but pleasing manner, and one very appropriate for the purpose. Messrs. WATERER and VEITCH & SONS occupy the centre with very choice, well-selected specimens. The sides are occupied with fine collections from Messrs. G. PAUL & SONS, DICKSONS of Chester, W. LEE & SON, CUTBUSH, BARRON of Elvaston, JEFFRIES of Cirencester, and others. We must refer to another column for the details of these beautiful collections, and for the plan of arrangement adopted. (See fig. 57, p. 435.)

The cut specimens are extremely numerous, and come from all parts of the kingdom. Very cordial thanks are due to Mr. DUNN and our Scottish friends, who have sent so many specimens, with details as to the aspect and soil upon

which the trees grow, as well as their heights. The collection includes specimens from H.M. the QUEEN; the Royal Gardens, Kew, which sends nearly 500 kinds; the Royal Botanic Garden, Edinburgh, and the noblemen and gentlemen mentioned in our last issue. The deep colour and robust growth of the Scottish specimens, as well as their historic interest, are very remarkable, though the number of cones is relatively small. Indeed, the production of cones generally throughout the country this season seems comparatively limited. Ireland, where the Conifers have, in our experience, a richer colour than elsewhere, is represented by collections from Mr. SMITH-BARRY, of Pota and Mr. ACTON of Rathdrum. So numerous are the cut specimens, that after nearly filling the whole of the large vinery, one large tent and one smaller one, three long benches had to be erected for their reception in the open air adjacent to the large tent.

In the competing classes, a Veitch Medal and £5, the amount of the 1st prize for a collection of fresh cones and branches with foliage, was awarded to the Dowager Marchioness of Huntley (gr., Mr. Harding), among whose specimens were

DAVID DOUGLAS

cones of the noble *Pinus macrocarpa*, P. Jeffreyi, with its dark-coloured cones; *P. ponderosa*, P. muricata, *Cedrus Deodara*, *C. atlantica*, *Abies Webbiana*, and *Torreya Myristica*, with many others.

The 2nd prize, a Silver Knightian Medal, was allotted to Lord WIMBORNE (gr., Mr. CRASP). In this collection were cone-bearing branches of *Cunninghamia sinensis*, *Sequoia gigantea*, *Abies orientalis*, *Pinus insignis*, *Abies Pinsapo*, *Arancaria imbricata*, and several others.

The famous Dropmore collection included several fine cones of *Araucaria imbricata*, with male catkins also; cone-bearing specimens of the very beautiful *Tsuga Brunouiana*, the only specimen so far as we saw in the exhibition; *Picea sitchensis* (= *Menziesii*), *Cedrus Deodara*, *Pinus Jeffreyi*, *P. densiflorus*, &c. It seemed rather a pity that Mr. HERRIN did not enter into the competition, as he must infallibly have taken a good place.

Among the cut specimens shown by Mrs. FORD, of Pencarrow, are fruiting specimens of *Abies firma*, the first that we have seen on English-grown trees.

As to the Conferences, Asters and Sunflowers formed the subject of discussion on the first day.

We are precluded from reporting the proceedings in full, as they will be published hereafter in the *Journal* of the Society. It must suffice to say, that the introductory address of Mr. BAKER on Tuesday was devoted mainly to the botanical features of the two genera, *Aster* and *Helianthus*, and to their geographical distribution. The paper contributed by Professor GOODALE naturally covered pretty much the same ground, and included a general review of the latest opinions of Professor ASA GRAY on the subject. Mr. WOLLEY DOD followed, with a practical paper on the selection and cultivation of the Michaelmas Daisies, the results of hybridisation, and other cognate subjects.

Mr. DEWAR came next, with a paper on the genus *Helianthus*, which, for garden purposes, he divided into early, mid, and late varieties. Mr. DEWAR's paper was marked by great critical acumen, the outcome of patient study and observation. It may not be possible when the details are before us, to agree with all his conclusions, but there can be nothing but respect for the manner in which he has arrived at them. In the course of this paper, two singular circumstances which are not generally known were mentioned, one, that *Helianthus multiflorus*, see fig. 51, probably the commonest of all the perennial Sunflowers in gardens, is unknown in a wild state, so that the origin of the species is so far quite unknown. The other point is that, though so common, and presenting so many varieties, it rarely produces perfect fertile seeds. In the course of the discussion on this paper, Mr. WOLLEY DOD mentioned that he had raised a hybrid between *Helianthus cucumerifolius* and *H. annuus*, and that the resultant seedlings belonged, in feature, half to one, and half to the other parent. Mr. JENKINS then read a suggestive paper on the cultivation of these plants.

On the whole, the conference afforded an excellent example of the reciprocal aid that botanists and horticulturists can give to one another. It was rendered abundantly clear that cultivation under the eye of an experienced botanist is calculated to be of very great service in enabling us to appreciate the extent of variation, the limits of particular forms, and the constant as distinguished from the accidental characters of particular species. From a purely horticultural point of view, cultivation enables the gardener to select those he likes best, or which are best adapted for his purpose, and to reject others perhaps equally interesting botanically, but less valuable for decorative purposes. From this point of view we cannot express too strongly our sense of the value of Chiswick as an impartial trial-ground; nor can we too earnestly press on the Council the desirability of developing the resources of, and enhancing the utility of, the old garden.

The Conifer Congress on Wednesday was opened by Dr. MASTERS, who, in his opening address alluded to the many points of interest in the group, their ancestry, their relations to Lycopods and Selaginellas, their mode of growth, their physiological peculiarities, their beauty and stature, &c. Dr. MASTERS, both on scientific and on practical grounds, advocated the comparative study during growth, organ by organ, of the various species, giving illustrations incidentally of the valuable results which would thus accrue alike to the cultivator and the botanist.

Adverting to the introduction of Conifers from other countries, Dr. MASTERS stated that, with the exception of the Scotch Pine, the Yew, and the Juniper, no species of Conifer was wild in this country. Our earliest records of the introduction of plants did not go beyond the sixteenth

FIG. 55.—ADIES MAGNIFICA, VAR. SHASTENSIS (THE SHASTA RED FIR), SCALES, RICH PURPLE; PROJECTING BRACTS, GOLDEN BROWN. (SEE P. 430.)

century. The Pineaster was known here in 1596, the Larch in 1629, and the Lebanon Cedar in 1664. JOHN EVELYN was credited with the introduction of the so-called Cedar (*Juniperus virginiana*). From 1827 to 1833, DOUGLAS, whose portrait is given in another column, startled the botanical and horticultural world by the number and importance of his discoveries in North West America. The Douglas Fir, the Lambert Pine, *Abies amabilis*, *A. grandis*, *A. nobilis*, and the Menzies Spruce, were among the introductions of DOUGLAS. To the Royal Horticultural Society it must always be a source of legitimate pride that these magnificent discoveries, like those of HARTWEG and FORTUNE, at a later date, were made by officers of the Society, and that the plants were originally distributed from the Society's garden. In this connection, it was interesting to note that, in introducing the *Arancarias* from Chili and Australia, the *Sequoias* and *Libocedrus* from the North-West Pacific, and the allied *Cycads* from South Africa and Australia, we were but bringing back plants that were once native to our own soil, while the Ginkgo was instanced among several others as a survival from geologic times; and, as such, is as remarkable as would be the appearance, in a living state, of the "extinct animals," models of which may be seen in the grounds of the Crystal Palace.

Alluding to the economic part of the subject, Dr. MASTERS referred to the enormous importance of the order as supplying timber and other products of everyday use, and hoped that one result of the Conference would be the accumulation of evidence concerning the economic value of these introductions, especially of some of the most recent ones. The value of the Lebanon Cedar as a decorative tree, and of the Weymouth Pine as a timber tree, was admitted, but in regard to others there was still doubt. Had not the Deodar disappointed expectations? but was not the Douglas Fir likely to be of great value? Again, considering the distressing failure of the Larch in many situations owing to attacks of a fungus, had we among new-comers any efficient substitutes? He ventured to think that there were several, as Lobb's Cypress (*Thuja gigantea*), the Lawson Cypress, the red-wood (*Taxodium sempervirens*), the Nootka Cypress (*Thujopsis borealis*), the *Abies brachyphylla*, and some others of Japanese origin. It was to be feared, however, that many of the Conifers, especially the Pines, were too precocious in this climate, and attained their full span of life much sooner than in their native land.

Mr. H. J. VEITCH read a paper on Japanese Conifers, in the course of which he alluded to the climatal features of the islands, and remarked that there were in Japan no fewer than forty-one species of Conifers, many of which had been discovered and introduced by JOHN GOULD, VEITCH, and CHARLES MARIES.

Papers were also read on "Conifers as Specimen Trees and for Landscape Gardening," by Mr. G. NICHOLSON; on "Conifers for Timber and in Plantations," by Mr. A. D. WEBSTER; an excellent practical summary of the timber value of certain trees, by Mr. CHARLES HERRIN; other papers were deferred till Thursday. The exhibition, in connection with which the Conference is held, will remain open till Saturday evening.

ABIES MAGNIFICA, VAR. SHASTENSIS (THE SHASTA RED FIR). This variety forms a large, almost exclusive, forest on the high plateau of lava thrown out by Shasta in former times. A few trees are scattered also over the high southern slopes of Mount Eddy, Scott, and the Trinity peaks, at an

elevation of 6000 to 8000 feet. The illustration of two standing Firs, which accompanies this report, was taken from a photograph of Horse Camp, near the timber line of Shasta, before sunrise. The peculiarity of this variety of Fir, aside from its locality, is connected entirely with the fact of its cone, bracts becoming long and protruded, a half to a full inch between the scales, rendering the large purple cone, thus decked out with tasseled fringes, a most beautiful object. This feature of the cone caused this tree to be considered as identical with Douglas' Bracted Fir, described, and it was so classified as late as 1880, in *California Botany*, but is now known to be clearly distinct. The trees are very large and lofty, though not so immense and high headed as in the typical southern form, but they become, on the southern slopes of Shasta, a dark gloomy assemblage of massive black trunks, coloured on the north side from base to the limbs with bright yellow lichen, or tree moss, the lower limbs draped here and there with long, sweeping festoons of black filmy lichen, giving a funereal aspect to the whole scene, scarce relieved by the twitter of a red squirrel, the long wailing note of a woodpecker, or the occasional cry of a bald eagle. Too elevated to be yet reached by the avarice of man, but little is known of the qualities of this Red Fir, but it is probably not unlike its southern relatives. *Report of the Californian State Board of Forestry, 1889-90.* [We believe this to be the superb form figured from the Cranston Nurseries as a form of *A. nobilis* or *magnifica*, and of which we now reproduce the illustration, fig. 54. Ed.]

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION), NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The Annual General Meeting of the above Societies will be held, Mr. J. DOUGLAS, the Hon. Secretary, informs our readers, by permission of the Horticultural Club, in their rooms at the Hotel Windsor, Victoria Street, at 4.30 P.M., on Tuesday, October 27. The business of the meeting will be to elect the office-bearers and committee for the ensuing year; to receive the reports of treasurer and secretary; to arrange for the exhibitions of 1892; and transact any other business which may be deemed necessary. The annual meeting presents a favourable opportunity for the election of new members.

GREENHOUSE RHODODENDRONS AT MESSRS. J. VEITCH & SONS.—In the house devoted to these almost perennial-flowering plants at the Royal Exotic Nurseries, Chelsea, about 180 fine open trusses may now be seen, all shades of colour. Some of them are of such an exquisite blending of rose-yellow and scarlet, that their colour is difficult to name. The new crosses with *R. multicolor* are bringing in some lovely winter flowers on compact plants, among them being rose, crimson, and bronzy-orange. Of the larger kinds, especially beautiful are Princess Christian, yellow with red stamens; Ajax, a noble salmon-red with dark stamens; lateo-roseum, pink with yellow showing through it; *No. Plus Ultra*, scarlet; President, yellow with a bronzy-red tinge over the segments; *Aspasia*, light chrome-yellow over white ground, and with light stamens; *Ophelia*, pink with crimson anthers; Lord Wolseley, orange-scarlet; Maiden's Blush, blush-white; and Princess Alexandra, white.

DEVON AND EXETER GARDENERS' ASSOCIATION.—A meeting of gardeners and friends of horticulture was held in the City Guildhall, Exeter, on the evening of Monday, October 5, to consider the advisability of starting a Mutual Improvement Association. Mr. Alderman K. ROBERTS occupied the chair. Various letters were read from gentlemen who were unable to attend, one and all of whom were in favour of the scheme, and several persons present in the hall spoke of the great advantages that would accrue to the horticulturists of Exeter and neighbourhood if the scheme could be brought to fruition. On the motion of Mr. HOPE, seconded by Mr. LOCKE, it was decided that the subscription from head gar-

deners should be fixed at 2s. 6d., under-gardeners 1s. 6d., and honorary members 5s. per annum. It was resolved to hold the meetings on Wednesday evenings during the winter months, at 8 o'clock, the place of meeting to be left for the committee to arrange.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—At a meeting of the above, held on Tuesday, Sept. 29, a paper was read by Mr. R. DEAN, Ealing, on the "Life History of a Flower," the one chosen for illustration being the florist's Tulip. The subject was illustrated by coloured diagrams of the various parts of the flower, and was attentively listened to throughout.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting held on September 12, 1891, the Floral Committee of the above Society granted the following:—

First-class Certificates.—To Mr. J. Th. Van Den Berg, jun., Jutfaas, for *Begonia tuberosa erecta narcissiflora* (seedlings, 1891); collection of cut flowers from *Begonia tuberosa erecta*; collection of cut flowers from *B. t. e. duplex*; collection of cut flowers from Dablia, with single flowers in the varieties: Favori, Madame Coquet, Madame Chauvé, Contraste, and Souvenir de Madame Chrétien. To Messrs. Groenewegen & Co., Amsterdam, for *Cactus Dahlia H. Cannell* (new plant); *Dahlia* with single flowers, Scarlet Dwarf (new plant); *Pteris tremula Smithiana* (new plant); *Pteris Victoria* (new plant). To the Botanical Garden, Amsterdam, for a collection of *Drosera*, consisting of *Drosera binata*, Labill; *D. capensis*, L.; *D. dichotoma*, Sm.; *D. intermedia*, Hayn.; *D. longifolia*, L.; *D. rotundifolia*, L.; and *Drosophyllum lusitanicum*, Link. To Messrs. E. H. Krelage & Son, Haarlem, for *Gladiolus gandavensis* var. Bruca (new plant); *G. g.* var. Doctear Bailly (new plant); *G. g.* var. Erigone (new plant); *G. g.* var. Glaive de feu (new plant); *G. g.* var. Jubilé (new plant); *G. g.* var. Mimos (new plant); *G. Nanceianus* var. Comte Horace de Choiseul (new plant); *G. n.* var. Dr. H. P. Walcott (new plant); *G. n.* var. Massena (new plant); *Gloxinia hybrida grandiflora* var. Gloire de Haarlem (new plant); *Kniphofia* hybr. var. Franz Büchner (new plant). To Messrs. Ant. Roozen & Son, Overveen, for *Begonia tuberosa* Above All (new plant); *B. t.* Le Progrès (new plant); *B. t.* Mr. J. K. Budde (new plant); *B. t.* Mr. Ant. Roozen (new plant); *B. t.* Miss North (new plant); *Cactus Dahlia Lockenkopf* (new plant). To the Zoological Garden, Rotterdam, for *Pteris amplifrons* (new plant). To Mr. O. J. Quintus, Groningen, for *Vriesia obliqua* (*V. retroflexa* × *amethystina*) (new plant). To Mr. A. G. M. Richard, Naarden, for *Carex gracillima* (insufficiently-known plant). To Mr. J. H. Schober, Putten, for *Cattleya virginialis* (new plant). To Mr. Jac. Smits, Naarden, for a collection of cut flowers from *Begonia tuberosa*. To Mr. C. G. Van Tubergen, jun., Haarlem, for *Nerine Sarniensis* var. venustum (new plant); *Colchicum giganteum* (new plant).

Second-class Certificates.—To Messrs. Groenewegen & Co., Amsterdam, for *Adiantum* hybr. (new plant); *Asplenium caryotefolium* (new plant). To Messrs. E. H. Krelage & Son, Haarlem, for *Gloxinia hybrida Kaiser Friedrich* (new plant); *Zephyranthes candida* Herb. var. major (new plant). To Messrs. Ant. Roozen & Son, Overveen, for *Anemone japonica* var. cristata (new plant); *Begonia tuberosa* hybr. *Cameilia* (new plant); *B. t.* hybr. Mr. Gladstone (new plant); *B. t.* hybr. Nelly (new plant); *B. t.* hybr. Orange géant (new plant); *Cactus Dahlia* hybr. *Lilian Aberly* (new plant); *Chrysanthemum* hybr. *Anatasio* (new plant).

Vegetable and Fruit Committee.—A Second-class Certificate to Mr. J. De Waard, Groningen, for Beans (*Phaseolus multiflorus*) with white flowers (insufficiently known).

—The Council of Administration of the above have nominated Dr. ROBERT HOOG and Dr. MAXWELL T. MASTERS honorary members of the Society, in recognition of their long and useful services to botany and horticulture.

PELARGONIUM SOUVENIR DE MIRANDE.—A number of plants of this pretty variety now in flower in McArthur's nursery, Maida Vale, W., show how useful and handsome it is. It is of the habit of Vesuvius, and seems equally free to flower at any season of the year. The two upper petals of the flower are white in the lower halves, and salmon-scarlet at the tips, or outer halves. The other three petals are salmon-scarlet, with a white ray at the base, which extends about a quarter of the length of the petal, and has two or three light crimson lines in it. The backs of the flowers are nearly white. There is a quaint Orchid-like look about the flower, which is of a very charming tint.

THE VALUE OF NITRATES AND AMMONIUM SALTS AS PLANT-FOOD.—An investigation has recently been conducted by HERR E. LAUSENT into the value of the nitrates and the salts of ammonium as food for plants. He experimented chiefly with nitrate and sulphate of ammonium, the nitrates of potassium and sodium, the nitrite of potassium, and the phosphorus salt of ammonium. Potassium nitrite was discovered to be distinctly poisonous, as also is nitrate of ammonium, if the solution be of an acid character. With green plants in "water-culture," the roots of the so-called "ammonia-plants" were found to be more active when they were fed with the salts of ammonium; but, on the other hand, the roots are shorter, and do not ramify so much when the plants are treated with solutions of the nitrates. It is curious to observe, that when the plants are grown in soil, they thrive better when watered with weak solutions of the nitrates.

THE NITROGEN COMPOUND EVOLVED FROM SOILS.—Clay soils that are kept moist gradually lose nitrogen in the form of volatile products, but if the same soil is kept dry, the loss, although quite recognisable, is very much smaller. The nitrogen evolved in the form of volatile nitrogen compound is greater than that evolved at the same time in the form of ammonia—a result contrary to that obtained with vegetable soils. MONS. NORTHELD, to whom these researches are due (*vide Comptes Rendus*, cxiii., p. 195), is of opinion that the evolution of volatile nitrogen compounds is probably intimately connected with the life of microbes or low vegetable organisms existing in the soil.

TIMBO.—This is the name given in Brazil to several plants, such as *Serjania cuspidata*, St. H.; *Serjania lithalis*, and *Paullinia pinnata*, of the order Sapindaceæ; and *Tephrosia toxicaria*, and *Physalis heterophylla*, of the order Leguminosæ, all of which are used by the natives for stupefying fish. A decoction of the root is preferred, as affording the more powerful poison. Recently, the poisonous principle common to all these plants was isolated by HERR F. PFARR, who has named it Timbôn; it seems to be a nerve poison of the toxine class.

THE GENUS PÆONY.—DR. E. HUTT has published in Dr. ENGLER'S *Botanische Jahrbücher* for 1891, a monograph of the species of this genus. Dr. HUTT recognises fourteen species and numerous varieties, but appears to have overlooked Mr. BAKER'S monograph published in our columns, as well as the figures given.

EMIGRATION.—The recent circular issued by the Emigrant's Information Office, 31, Broadway, Westminster, S.W., informs intending settlers that in Australasia there is a demand for men who understand pruning fruit trees, Vine-growing, and market gardening, and such persons will, under certain conditions, get free or reduced passages to Queensland and Western Australia. In South Africa, Cape Colony, and Natal, fruit growers, with some capital, will find good openings. It has been found necessary to publish special warnings against emigration to Brazil, and, under present circumstances, to the Argentine Republic also. Intending emigrants to those countries, or to Chili, are again strongly advised not to go at the present time. Further and very recent information confirms the cautions already given.

THE PLUM HARVEST IN BOHEMIA.—In Bohemia, as we learn from a correspondent at Schlan (September 17), in consequence of the long-continued fine warm weather, the Plums have become well ripened, and they will bear comparison with the best Bosnian products. Bohemia, owing to its extensive cultivation of the Plum, and its cheap transit rates, will be in the position to sell its products at very reasonable prices in the neighbouring countries. In the Elbe Valley, the drying of the fruit has begun, and in the course of eight days, it will become general throughout the country. *Moller's Deutsche Gärtner Zeitung*.

DISTRIBUTION OF PLANTS.—The Commissioners of Her Majesty's Works and Public Buildings intend to distribute this autumn, among the working classes and the poor inhabitants of London, the surplus bedding-out plants in Hyde and the Regent's Parks, and the pleasure gardens, Hampton Court. If the clergy, school committees, and others interested, will make application to the Superintendent of the park nearest to their respective parishes, or to the Superintendent of Hampton Court Gardens, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution.

FERTILISER FOR STRAWBERRIES.—M. ZACHAROWICZ has been experimenting on certain varieties of Strawberries in the South of France, with reference to their culture in the open air, or under grass, and with and without manure. The six sorts experimented on, as regards earliness and productiveness, were:—1, Crescent Seedling; 2, Tonkin; 3, Laxton's Noble (translated "La Noble Laxton"); 4, Victoria; 5, Marguerite Lebreton; and 6, Le Caprice. The soil in which they are grown is a calcareous loam, rich in phosphoric acid and nitrogen, moderately so in potash. Laxton's Noble and Crescent Seedling do best in frames. Nitrogenous manures are of little service comparatively, but sulphate of potash, mixed with superphosphate of lime, give the best results. In the open air, Crescent Seedling, Laxton's Noble, and Caprice, grown without manure, were the most satisfactory. Elaborate details are given in the *Annales Agronomiques* for August 25.

CASSIPORE PRACTICAL INSTITUTION OF HORTICULTURE, FLORICULTURE, AND AGRICULTURE.—Rather a long title, but in spite of it, the Institution does good work. It was founded by BAHU HEM CHANDER MITTER in 1886, with the object of imparting a practical knowledge of plant cultivation to a certain number of students. An experimental garden, with plant-houses and a library, are maintained for the benefit of the students, and a flower show is held once a year to illustrate the progress of horticulture. MR. LOKE NATH GHOSE is the Honorary Secretary.

PRICKLY PEAR.—The *Agricultural Journal*, published by the Department of Agriculture of the Cape Colony for July 30, contains an article on the *Opuntia* which, having being introduced about 1750 from India to the Cape, has now become a nuisance. The mouths of sheep and goats become covered with the spines, which excite inflammation of the throat and stomach, cattle suffer from purging, while ostriches become blind from the injury inflicted on the eyes. Nothing being done to prevent the spread, the plant has thriven to such an extent as to render many farms uninhabitable, the thickets protecting thieves and marauders, whilst the fruits furnish an intoxicating liquor which renders the natives unfit for labour. On the other hand, properly treated, and the spines removed by burning or stripping, the plant supplies valuable fodder—especially in times of drought; vinegar, alcohol, and molasses may be produced from the fruit. It is possible that the woody fibre might be utilised in the form of pulp for coarse paper, but we are not aware that this has been tried. The most effectual plan of removing the pest seems to be to cut it up into small fragments, which are thrown into a heap and allowed to

ferment, care being taken to exclude all the fruits and seeds, as the latter would germinate, and renew the mischief.

FRUITS FOR COTTAGERS.—We have received from the Royal Horticultural Society a specimen copy of a circular which it intends to distribute broadcast throughout the whole country, and which will be published and sold at the lowest possible price including postage, *i.e.*, 25 copies, 1s.; 50 copies, 1s. 6d.; 100 copies, 2s. 6d. We are glad to note that the Society in this matter has risen to the height of its responsibilities, and its duty to the country as a chartered society in its endeavour to disseminate an amount of very-much-needed information on the important industry of fruit culture. Only those who have mixed with the persons intended to be chiefly benefited are aware of the lamentably small amount of precise knowledge existing as to the proper sorts and varieties of fruits to grow. The idea in this pamphlet has been to bring before cottagers, small farmers, amateurs, and others interested in fruit culture for home consumption or sale the names of a few select Apples, Pears, Plums, bush fruits, and Strawberries; giving the time when the various fruits are in season, with remarks on habit of growth, and whether best grown with or without the protection of a wall or fence, or as bush, standard, or half-standard. The selection is in the main, a good one, and the desire of the compilers to keep it within very moderate limits has necessarily kept out of it many very desirable varieties, and some are included which, in our opinion, were better left out. The list of Apples is headed by Blenheim Orange, which is generally a shy bearer in its early years, although it is fruitful in good years when aged; and the old Hawthornden—omitted—is a very prolific early Apple, which bears carriage better than Lord Suffield, which is included. For northern counties, we would not do without the Red Calville, an early variety—a certain and an enormous cropper. Even at the risk of making the list a bit longer, the famous Warwickshire Wyken Pippin, a long-keeping prolific dessert Apple; Yellow Ingestrie, Summer Golden Pippin, Kerry Pippin, and that good Sussex variety, The Forge, ought to find a place.

The list of Pears would bear the addition of Glou Moreceau and Knight's Monach, which do well as standards in the southern and western counties of England, and especially on warm soils; and elsewhere they are deserving of the protection of a wall. We are glad to note Beurré Clairgeau is inserted as a stewing Pear, for it is an enormous and regular cropper, but seldom good enough for dessert. The list of eating Plums includes Jefferson's, a very superior fruit, but one which will do no good, we think, as a standard, except in the warmer shires. And to cooking varieties, the yellow Mirabelle, a prolific yellow Plum of the size of a Mayduke Cherry, good for bottling and the tree an abundant bearer, should be added; also Washington or Magnum Bonum. The bush fruits and Strawberries are good of their kind, but we wonder what the Lancashire lads would think of a list of fourteen varieties of Gooseberries!

CATTLEYA LABIATA, AUTUMN-FLOWERING, SWAINSON'S VAR.—The sale of the second consignment of this beautiful plant, recently imported by Messrs. F. SANDER & Co., St. Albans, at Messrs. PROTHEROE & MORRIS' Central Auction Rooms, on October 2, fully maintained—indeed, exceeded the prices realised by the first lot, a fact which speaks highly of its generally-acknowledged qualities. The plants were sold on their merits, and not a single lot was, we understand, left unsold, the whole realising about £1000. LORD RENDLESHAM, HIS GRACE THE DUKE OF SUTHERLAND, and the Right Hon. JOSEPH CHAMBERLAIN were among the principal buyers.

CATTLEYA LABIATA, GARDNER'S VAR.—At the same sale as above, a small plant, in flower, of a magnificent and distinct form of true *C. labiata*, which was sent to Messrs. F. SANDER & Co., some time ago, by one of their collectors, from the ground from which GARDNER records *C. labiata*, was sold, and realised

ten guineas. The collector stated that in its native habitat it flowers twice a year, but, as yet, its season of flowering under cultivation has not been determined. The flowers of the small plant in question were larger than those of the old autumn-flowering variety, and the labellum had a broad and flat expansion of the front lobe, as seen in *C. gigas*, but with a more circular outline. The sepals and petals were of a warm light rosy crimson, and the labellum rich velvety crimson or blood-red, and with a broad rose-coloured margin.

NATIONAL ROSE SOCIETY.—A meeting of the Executive Committee will be held, by kind permission of the Horticultural Club, at their Rooms Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 13th inst., at 3 o'clock. The matters to be discussed will be the Dates of Exhibitions in 1892; Awards in Suburban classes at the Crystal Palace Show; Suggested Alteration of the Schedules, &c.

MR. W. BULL'S NURSERY.—Among other Orchids in flower at Mr. WILLIAM BULL'S establishment, 536, King's Road, Chelsea, three very remarkable and handsome ones are now in blossom, viz., *Laelia præstans alba*, of which only two plants are known to exist; *Cypripedium Saundersianum*, a very distinct hybrid, and still very rare (not to be confounded with *C. Sanderianum*); and *Cattleya chelseiensis*, a natural hybrid, and one of the most beautiful of *Cattleyas*.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The first ordinary meeting of this Society was held at the rooms of the Literary and Philosophical Society, on Thursday, October 1. Mr. E. LAZENBY read a paper on "Gardening, its Progress, and its Institutions," reviewing the progress made in the gardening world during the last fifty years, the work done by our great educational establishments at Kew and Chiswick. A discussion followed on the paper and kindred subjects, Messrs. SALMON, WEST, and MURRAY taking part. The Chair was occupied by Mr. A. HESLOP. The next meeting takes place on October 15, when Mr. HONEY will read a paper on the "Peach."

HOME CORRESPONDENCE.

TROPEOLUM MRS. CLIBRAN.—I was glad to see the note by "W. D.," on p. 404, on this new *Tropeolum* which is likely to prove a very useful plant in the flower-garden. Its blooms are borne on stout footstalks, which renders it more valuable than those which are too fragile to carry their flowers erect. The colour, too, is so taking—a rich shade of orange—that it is sure to be welcomed in the future, colours of this kind being rather limited in number. *E. Molyneux.*

KNIPHOFIAS.—The very interesting article by Mr. Grant on these showy plants on p. 391, leads me to say that I intend to take the precaution to mulch our plants before winter, and should advise others to do likewise; as after a wet, sunless summer, as the past one has been, the plants will probably suffer. Our plants stand on turf, and have flowered splendidly hitherto, but this year there are very few flowers, owing to the severity of the weather last winter. The situation of the plants is not one of the best, it being somewhat shaded, which renders growth too soft. The variety *K. caulescens* has this year a magnificent appearance, with from fifty to sixty fully-developed flower heads. *E. M.*

MARKETING GARDEN PRODUCE.—The reports furnished from time to time by fruit growers especially, and growers of market produce in general, as to the scantiness or otherwise of their pecuniary returns, shows how very unevenly prices rule in markets for what is presumably the same quality. It does seem, however, that the real secret of these diverse returns is to be found chiefly in the nature of the salesman, rather than in varying quality of produce or public inconsistencies. The grower who has an established reputation among buyers has a good connection, and has ample supplies of special articles, seldom fails to obtain the best prices. Next, perhaps, come those growers who commit their produce to the care

of some well-known salesman, who, in his turn, can always rely upon that produce being even and good, and regularly and efficiently supplied. Then, perhaps, next in order of price come the growers, who, being in a small way, cannot command any considerable or good class connection, and have to take what offers are made. Finally, come the salesman's irregular or uncertain customers—those who send a small consignment, and no more, or, perhaps, large ones, not at all up to market form; these, so far from finding purchasers early in the day, are left over to take their chance at the later auction sales, and not unfrequently realise one-third their real value. It is of the latter class of growers from which we hear such complaints in the daily press—amateur market gardeners, who complain bitterly of their returns, although every new bushel of produce sent only serves to bring down prices. A close attention in the markets to market selling is in itself good education in market gardening. *A. D.*

TOMATOS AT KNEBWORTH.—When visiting Knebworth, the residence of Lord Lytton, near Stevenage, a short time ago, I was much struck with a house of Tomatos Mr. Kipling had in full bearing. The plants had done remarkably well, and the handsome rich-coloured fruit proved particularly tender and luscious, and the flavour all that could be desired. The house in which the Tomatos were growing had been devised by Mr. Kipling specially for the purpose. The experience he gained last season led him to the conclusion that a continual circulation of air, independently of side or top ventilation, was desirable, and which could be effected all over the roof, was just what was required for such a house, whether employed for forcing Strawberries, or for growing Tomatos. He therefore, determined to give Newton's reform system of glazing a trial, the principle being the use of patent steel rafters or bars, which are guttered, and so admit of a continuous circulation of air on each side, as well as through each lap of the large sheets of glass. The result is the remarkably fine crop of luscious Tomatos Mr. Kipling has grown this season. Newton's reform system may be described as the dry or open method, as opposed to the old tight putty glazing, and Mr. Kipling sums up its advantages over the older method, setting forth that it admits of a gentle but continuous circulation of air taking place all over the roof, independently of what is admitted by the ventilators, and he thinks this is beneficial to the plants, whatever may be the character of those grown. Mr. Kipling further stated that he had had in the same house a very fine lot of forced Strawberries, the best that he had ever grown. *R. D.*

MINA LOBATA.—This fast-growing climber, suitable for covering a bare stem or a trellis, may not be generally known. Two plants which I turned out of pots at the end of last June are now covered with blossoms, and prove very attractive. *J. Elcombe, Southampton.*

SUBJECTS OF STUDY FOR GARDENERS.—I have often noticed, in many young gardeners of today, the want of interest in the scientific study of their profession, and I have often thought that anything which would awaken a deeper interest in the things around them would be greatly to their advantage, and therefore of very great benefit to horticulture. The horticultural press could do much to remedy this by the insertion from time to time of articles in their various papers, dealing scientifically with matters which come under the daily notice of gardeners. I venture to think that a series of articles, dealing with the forms and functions of the various parts of a plant, would do much to awaken an interest in the study of botany, which would be of immense advantage to gardeners. If this study were more generally taken up, things would appear in quite a different light to many, and would be a source of very great pleasure, not to say profit; and many hours which are now wasted would be profitably spent in the study of the forms and functions of the various parts of a plant; the result would be, that gardeners of the future would be a better informed, and more intellectual class of men than is at present often the case. *W. L.*

WHAT IS A HARDY PLANT?—I cannot agree with your correspondent, "A. D.," at p. 344, where, under this head, he says, referring to *Hydrangea paniculata* and an herbaceous *Phlox*, that "there is absolutely no distinction between them in hardness and habit." The point of hardness may be allowed to pass, but the "habit" most certainly not. As a matter of fact, the *Hydrangea* is not strictly herbaceous, because the

stems never die down, and I certainly think it best described as a deciduous shrub, though in some winters it carries a certain amount of foliage. What has been the flowering stems of the present year in the *Hydrangea* will presently perfect buds, and these latter will, if sufficiently strong, produce flower buds another year; whereas, an herbaceous *Phlox* is not endowed with this gift at all, for the flower stems in their case are of only annual duration, and, if allowed to remain longer than one year, have no vitality in them, nor do they attempt to push forth young growths at almost every joint along the stem, as in the case of the *Hydrangea*. The flowering stems of all true herbaceous plants perish annually, and a new one is produced from the perennial stool or crown; and *Roses*, *Hydrangeas*, and such things that have vitality still remaining in their woody top growth, even as an Oak, or Elm, or an Apple, are deciduous trees or shrubs, and though "hardy perennial" without a doubt, have nothing whatever to do with "herbaceous" subjects. The *Polygonums*, too, are strictly herbaceous, and even the alpine or sub-alpine species annually lose their flowering-stems. The words "hardy perennials" has a very wide meaning indeed, and anything performing the function of the two words would be admissible, because shrubs, evergreen or deciduous, or climbers or trees, are quite within its limits. But, if the words "hardy herbaceous plants" only were employed, the true exhibits would be much more restricted, because this term in itself excludes all shrubs or similar things. The classes for hardy herbaceous plants have over and over again given rise to misunderstanding at shows, and chiefly because of the laxity of the committees and judges, the latter having frequently to my knowledge passed over *Sweet Peas*, *Asters*, *Ten-week Stocks*, and the like, in a class set apart for herbaceous plants. A few years ago, when I came to this neighbourhood, and was requested to take the Hon. Secretaryship of the local horticultural society, just the same error was made, annuals, biennials, and perennials, being staged for "hardy herbaceous plants"—and passed over by the judges; but it so happened that some dissatisfaction arose among the exhibitors in respect to the prize, and I, being referred to in the matter, surprised not a few by telling them that, according to the schedule, the whole of the exhibits should have been disqualified. Of course, an explanation was demanded, and quickly given; thus the cottagers learnt a lesson, and they now know pretty clearly what is meant by hardy herbaceous perennials. There was an error through ignorance, and I doubt not it is so with many others, and the best way for committees to do would be to instruct cottagers and others in the right way, taking care also to make the wording of the schedule clear. If the usual hardy border plants are desired, as *Sunflowers*, *Lencanthemums*, *Potentillas*, *Pyrethrums*, *Campanulas*, *Delphiniums*, and the like, the words "hardy herbaceous plants" should meet the case; the word "perennials" need not be used, as this is also conveyed in the term "herbaceous." I confess to not quite understanding what "A. D." intends by "hardwooded plants of annual growth from the roots." Perhaps your correspondent will furnish an example, because if "hardwooded," such growths should remain perennial. Perhaps also your correspondent will cite an instance of what he regards as an "hardy herbaceous shrub." In my opinion, such cannot combine in any one plant. *E. Jenkins.*

IXORA WESTII.—This variety is not frequently seen in collections of plants, but a good example of it is now in bloom in an intermediate-house in the Birmingham Botanic Gardens. The large clusters of pale rosy salmon-coloured blooms are both showy and pleasing, as the colour is distinct from that of other varieties; the plant is of easy culture. *W. D.*

A NEW BLACK-SKINNED POTATO.—I enclose you a cutting from the *Annandale Observer* of the 2nd inst., on the subject of the probable introduction of a new Potato, a black one, coming to us from the East. This was referred to about a fortnight ago, if I recollect right, in two of the London evening papers—the *Echo* was one, I forget the other. When I was a boy at school, at Welling, in Kent, under the Rev. Stephen Tucker, and afterwards under his son, Mr. Stephen Tucker, there was a black Potato, so called, in daily use for a part of the year. It was really a very dark purple skin, the colour of the darkest purple kind of the *Solanum Melongena*, or *Aubergine*—the *Bringal* of Bengal. It was a fairly dark purple right through, the colour getting lighter towards the centre, but decidedly a pale blue there. It was a very mealy Potato, and very highly

FIG. 56.—HELIANTHEMUM AUTUMNALE, FLOWERS CLEAR YELLOW, NATURAL SIZE.

appreciated. The Potato-pits were separated from the boys' gardens by a quickset hedge; but, in spite of that, on a dark winter afternoon, adventurous spirits would make a raid on the "black" pits, to roast them in the schoolroom grate in play hours. The white Potatoes were never attacked. The legend about these was, that they were imported by, or sent to, a gentleman named Friend, or Frend (at this distance of time I forget the correct spelling of his name), who lived in the neighbourhood of Tavistock Square, and had business relations with South America, from whence he got them. On looking closer at the extract, it will be seen that Zululand is hardly what we understand by the East, though in the Eastern hemisphere. When I was on leave from India in 1860-61, Mr. Stephen Tucker was alive, and I tried to trace the Potato so as to get some seed, but they had died out with him and he could not help me. J. A. C.

STRIPED BEGONIAS.—I read, in the last issue of the *Gardeners' Chronicle*, that you have received from M. Benary, flowers of a striped Begonia. A year since, I have had in cultivation a strain of Tuberosus Begonia, which I call reticulate. I send you by post some flowers of them, and I shall be very glad to know if those of M. Benary are the same size. A. L. Roscell, *Tronchiennes, Ghent*. [The flowers sent are very pretty and interesting, but different from those of M. Benary. En.]

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, October 6.—The meeting of the above Society was held, in conjunction with the Conference on Sunflowers, Asters, &c., in the gardens of the Society at Chiswick; the different objects exhibited occupying two large tents and the great vinery, besides a number of tables set alongside the walks in the reserve garden. For the purposes of the usual committee meetings the exhibits were not numerous, and consisted of Dahlias, including some meritorious seedlings raised from English-grown seed of Chrysanthemums, Cactus Dahlias, Cannas, Carnations, &c.

Orchid Committee.

Present: J. Veitch, Esq., in the chair; J. O'Brien, Sec.; Dr. M. T. Masters, F.R.S.; J. Douglas, C. Pilcher, and H. M. Pollett.

Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantine), exhibited a plant with a three-flowered spike of the true *Luelia Perrinii* alba. The flowers were 7 inches across, and with unusually broad sepals and petals; they were pure white, without the slightest shade of any other colour, except some very pale primrose at the base of the front lobe of the lip. A First-class Certificate was unanimously awarded.

G. O. Sloper, Esq., Westport House, Highworth, Wilts, sent a spike with three flowers of *Cattleya aurea marmorata*, a variety of great beauty, apparently intermediate between *C. aurea* and *C. Hardyana*. The flowers had the sepals and petals creamy-white, with a few rose-coloured spots and blotches; petals cream colour marbled with rose, through which a delicate tracery of cream-coloured veinery is seen. The lip has the front lobe dark purplish-crimson, the throat and side-lobes being rich golden-yellow. The edges of the side lobes of the lip forming the tube of the labellum is tinged with rose, the yellow veining running through it. An Award of Merit (unanimous).

F. A. Bevan, Esq., Trent Park, New Barnet (gr., Mr. B. Phillips), exhibited a finely-grown plant of the singular and beautiful *Cypripedium Sanderianum*, to which a First-class Certificate had been awarded in 1886. The plant had two spikes, bearing together six flowers, the curiously twisted petals of which were 12 to 15 inches in length, and spotted with dark crimson on the upper third, and tinged with rose on the lower part, constituting it a very distinct and attractive species; a Cultural Commendation was awarded. Mr. Bevan also sent a fine variety of *Odontoglossum grande*, and F. Wigan, Esq., Clare Lawn, East Sheen, Richmond (gr., Mr. Young), sent cut flowers of *Sobralia virginialis*, *Arundina bambusaefolia*, *Cypripedium Leeanum superbum*, and its two parents, *C. insigne* Maulei and *C. Spicerianum*, also a spike of *Cattleya maxima*, all exhibiting good culture.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. H. Herbst, W. Bain, G. Paul, B. Wynne, C. Jeffries, R. Dean, W. Bennett-Poe, H. Turner, E.

Mawley, T. Baines, G. Gordon, W. C. Leach, G. Phippen, C. E. Pearson, W. Furze, J. Walker, H. Cannell, and J. Laing.

Competing Classes.—Mr. Chadwick (gr. to E. M. Nelson, Esq.), Hanger Hill House, Baling, was placed 1st for eighteen bunches of perennial Asters and Helianthus in fine bunches, including *A. floribunda*, *A. novae angliae rubra*, *A. Amellus*, *A. Chapmanni*, *H. latiflorus simplex*, *H. multiflorus*, *H. m. flore pleno*, &c.; 2nd, Mr. Sage (gr. to the Earl of Dysart), Ham House, Richmond. In the class for twelve bunches, the 1st prize was not awarded, Mr. Marshall's stand being disqualified because of its containing *Colchicum variegatum*. The 2nd prize was taken by Mr. A. Harding (gr. to the Dowager-Marchioness of Huntley), Orton Hall, Peterborough. Mr. Debenham, St. Peter's, St. Albans, Herts, was 1st for eight bunches. Especially good were those of *Rudbeckia Newmanni*, *Phlox paniculata*, a fine white flower.

Miscellaneous.—A few Dahlias were shown, much fewer than might have been expected, for they are still flowering finely at the Dahlia nurseries. Messrs. H. Cannell & Sons sent from their Swanley nurseries some bunches of decorative and Cactus varieties, including *Princess Christian*, very pretty and bright, rose flushed with crimson, and tinted with mauve purple (Award of Merit); Mrs. Thornton, pale rose, deepening on the edges to silvery rose, and paling to blush, large, and inclining to coarseness; Ernest Cannell, bright pale orange-scarlet, paling to orange-salmon on the edge; Sir Roger, bright salmon-scarlet, deeper in the centre; Robert Cannell, deep rosy crimson centre, paling to rose and lilac; and *Beauty of Eynsford*, reddish salmon centre, with deep buff edging, very distinct. Messrs. Cannell & Sons also had fifteen varieties of Cannas, in bunches, of a showy character, and the following new varieties of Chrysanthemums: *M. R. Bahanut*, a large incurved variety, colour pale bronzy-rose, with silvery reverse, deepening to cerise early, and somewhat flat, but not showing the flower off to the best advantage; Miss Watson, a bright pale yellow Japanese variety, deeper in the centre, of a very pleasing shade of colour (Award of Merit); *M. V. Marchant*, blush, with slight pale rosy-purple centre, and some of the petals tinted in the same way—a reflexed Japanese; *Beechwood*, a sport from the brownish-crimson *H. Jacotot*, orange and reddish-brown, deep golden reverse, a fine fully-reflexed flower—Japanese; Mr. Harry Laing, a reflexed Japanese, pale lilac, flushed with rose in the centre, large and full; and *Ann J. Chrétien*, crimson, shaded with maroon, the reverse silvery salmon-orange, a fine-coloured early October variety.

Mr. Robert Owen, nurseryman, Maidenhead, also had some Chrysanthemums, including English seedlings. Foremost were three pretty *Pompon* varieties, viz., *Mdlle. Edouard Lefort*, a very pretty and compact, small-flowered variety, gold flushed with brown in the centre, and the petals fimbriated (Award of Merit); *Madame Gabut*, blush, suffused in the centre with lilac—very pretty; and *Mdlle. Jacob*, pinkish-lilac, with golden centre, very pretty small, compact flowers; also a reflexed variety, *Theophile Reederer*, pink, tipped with cream, the centre gold—later flowers under glass take on the true reflexed form, being creamy-white, with a golden centre; *Lady Emily Fitzmaurice*, a bright golden reflexed decorative Japanese, small, and very rich in colour; *Mrs. Neve*, a white flower, in the way of *Madame Desgranges*, not so much reflexed; *Success*, a bright-coloured Japanese, pale reddish-claret—very promising; and *Madame Bellan*, pale soft pink, paling to blush, and yellow centre—the committee wished to see these two again.

From Messrs. Pitcher & Manda, nurserymen, Swanley, came white *Carnation Lizzie McGowan*, a pure white-flowered American variety, broad-petalled, very fine, does not split its calyx; slightly fragrant. The plants bloom abundantly, and apparently produce but little grass. Award of Merit.

Mr. J. Hudson, The Gardens, Gunnersbury House, Acton, had some plants of *Margaret Carnations*, raised from seeds sown on March 29, and lifted from the open ground to bloom in pots under glass. All the plants were carrying excellent heads of bloom.

Messrs. J. Laing & Sons, Forest Hill, had a stand most lavishly laid out with cut blooms of Asters, Chrysanthemums *Leucanthemum* and *maximum*, *Helianthus* in variety, and a quantity of Dahlias, consisting of most sections of that flower. The collection of Messrs. Collins Brothers, and Gabriel was even larger, and consisted of a large number of properly named cut blooms of *Pyrethrum roseum* var.

J. N. Tweedy and Hamlet, the first-named rosy-crimson, the latter rich pink; *Centaurea montana alba*, *Helenium autumnale*, *Gaillardia grandiflora*, many species and varieties of *Aster*, *Stenactis speciosa*, the fine yellow-flowered *Oenothera serotina*, and *Liatris pycnostachya*, a long spike of small rosy-purple blossoms—showy.

The box of trusses of bloom of beautiful *Rhododendrons* shown by Messrs. James Veitch & Sons, of the Chelsea Nurseries, served as a forcible illustration of their value as autumn-flowering plants. Altogether, there were some fifteen varieties, showing a wide range of colour, and the crimson-rose and golden varieties were particularly attractive. We speak of them as greenhouse *Rhododendrons*, but what they require, and especially at this season of the year, is an intermediate-house, with a temperature of from 50° to 55°, and it does seem as if they make excellent London plants, for they stand fog well, and do not appear to be injured by it. They are perpetual flowerers too, for Messrs. Veitch & Sons have exhibited flowers at every meeting of the Royal Horticultural Society held during the present year. The stout texture of the blossoms causes them to be lasting, and they retain the brilliancy of hue for a considerable time. Then the smoothness and sheen of the leaves prevents anything like deposits resting upon them; and as a cultivator once said, they "Cleanse themselves." The varieties staged by Messrs. Veitch & Sons, were *Ne Plus Ultra*, bright scarlet, of fine shape and substance; *Diadem*, orange-scarlet, large, and of fine form; *Lord Wolsley*, apricot, flushed on the edges with orange-scarlet, large, well-formed flowers; *Star of India*, apricot, with a very light wire edge of crimson-salmon, fine shape, and bold truss; *Ajax*, bright salmon, with shading of rose on the edges, the lobes well rounded and smooth; *President*, one of the freest bloomers, in colour bright yellow, shaded, and distinctly edged with salmon—a singularly distinct and beautiful variety, and of the finest form and substance, and said to be singularly free of bloom; *Monarch*, buff, with slight wire edge of deep salmon; *Princess Christian*, deep yellow—large and stout; *Aspasia*, lemon-yellow, large in size, and of fine shape; *Ophelia*, creamy-pink, with slight wire edge of rose—very fine shape, and remarkably pleasing; *Luteo-roseum*, soft pink, with a flush of soft mauve on the petal edges—a remarkably free-flowering and charming variety; *Princess Royal*, soft pink, small-flowered, but a very pleasing tint; *Princess Alexandra*, blush—very pretty; *Maiden's Blush*, blush, tinted on the edges with delicate pink; and *Imogene*, cream, with a very soft tint of blush.

Fruit Committee.

Present: T. Francis Rivers, Esq., in the chair; and Messrs. W. Wilks, P. C. M. Veitch, W. Bates, W. Denning, A. Dean, J. Wright, M. Dunn, G. Reynolds, H. Balderson, J. Hudson, J. Cheal, G. Wythes, P. Crowley, and T. J. Saltmarsh.

The subjects brought to the notice of the committee were small in number, and included three dozen fine-looking Melons, *Hero* of Lockinge, from Messrs. Rothschild, Gunnersbury Park, Acton (gr., Mr. G. Reynolds); *Coe's Golden Drop* Plums, in very nice condition; and a very prolific *Pea*, *Success*, with dark green scimitar-formed pods.

Lord Foley, Ruxley Lodge, Esher (gr., Mr. Müller), showed *Barrington Peaches*, a Melon of the *Cantaloupe* type, and a dish of Apples, sent for a name.

Some *Louise Bonne de Jersey* Pears came from J. Shuter, 66, The Grove, Hammersmith.

Mr. Wythes, gr. to the Duke of Northumberland, Syon, showed ripe fruits and foliage of *Monstera deliciosa*.

From the Society's Garden there was an exhibit of Hungarian Grapes. One of these, *Dodrelabi*, Mr. Barron considered to be identical with *Gros Colmar*. Another, the *Muscat* of Hungary, appeared to be a small form of *Muscat* of Alexandria, very richly flavoured. The berries are less than half-an-inch in diameter. It is likely that this variety will prove a great favourite with those preferring fine flavour to mere size.

Dishes of cooked Apple chips and rings dried in the Mayfarth apparatus were shown; they were pronounced to be equal to the American productions in this line, but less brisk in flavour than freshly-picked home-grown fruit. On the other hand, Prunes made in the same apparatus of Fellemberg, Poupart's, and Rivers' Prolific Plums, were delicious.

Some good samples of dried Plums were shown by Colonel Hayward, Crosswood, Welshpool.

A dozen novelties in Plums in the form of fruit-

bearing branches came from Messrs. Rivers & Son, Sawbridgeworth. The fruits were of varied size and colour, but their qualities have yet to be ascertained. Fine dishes were also shown of late Grand Duke, Monarch, late Transparent Gage Plums, as well as a well-fruited pyramid tree of the Conference Pear.

The Mayfarth drying apparatus was at work on each day of the Conference on various kinds of fruit, and afforded an excellent object lesson to fruit growers. With such an apparatus in his possession, we should hear of fewer cases of the farmer giving his too-abundant fruit to the swine when a glut of it brought the price down so low that it did not pay him to send it to market.

Exhibition of Aster and Helianthus.

These exhibits were, in response to the invitation issued by the Society, exceedingly numerous, and occupied considerable space in the great vinery and a tent in the garden. The Kew collection of Asters, which we take to be fairly accurate as to naming, included *A. Novii* Belgii, a flower $1\frac{1}{2}$ inch in diameter, light purple. Of this species were several forms, as *Harpur* Crew, white; and *densus*, light blue, of shilling size; *A. Novae Angliae* var. *rubra*, dark purple, good diffuse habit; *A. n. a.* var. *pulchellus*, with slightly-twisted bright purple rays, and brown pappus. Others were *A. Amellus*, pale

purple, a bright flower; *lavigatus*, rosy-lilac; *Apollo*, *densus*; also the true type of *A. Novii* Belgii, and *A. grandiflorus*, a fine bloom; *A. g. caerulea*, *A. Novae Angliae pulchellus*, *A. amethystinum* *A. turbinella*, *A. Lindleyanus*, late, pale lilac in colour; *A. umbellatus*, white, with a green disc; *A. acris*, in two forms, purple, and pale lilac; *A. cordifolius elegans*, *A. c. major*, *A. ericoides*, Harvard variety, numerous small pink flowers; *A. horizontalis*, numerous small white flowers, with a pink disk. The Society's collection of *Helianthus* included *occidentalis*, *decapetalus*, *multiflorus*, *H. m. Peter Barr*, *divaricatus*, *rigidus*, *semiplenus*, *latifolius*, *elatio*, *multiflorus maximus* (a fine thing), and *multiflorus Soleil d'Or*, *m. plenus*, *rigidus*, and *rigidus elegans*.

Messrs. Paul & Son, the Old Nurseries, Cheshunt, showed good bunches of Asters of the showier species, and *Helianthus major*, *H. multiflorus*, and others, about twenty-four bunches in all.

Conifer Conference at Chiswick.

Perhaps never before has there been brought together such an array of home-grown specimens of Coniferous trees and their cones than that exhibited at the Royal Horticultural Society's Gardens at Chiswick during Tuesday and the following days of the present week. Representative collections of

twigs and attached cones of many species, principally rare, of Coniferae; and what strikes one is the healthy hue and the look of rapid growth that pervaded the whole of them. Amongst others we noticed the rare *Pinus Koraensis*, with fully developed cones, the pretty *P. sylvestris aurea*, *P. Balanderi*, *P. Lambertiana*, *P. densiflora* and *P. montana*, *Abies amabilis*, *A. magnifica*, *A. pichita*, and the rare *A. Pinsapo glauca*, as being in this fine collection, while *Cephalotaxis pedunculata*, *Torreya grandis*, and *Taxus japonica* were also shown in good form.

The Scone collection from the Earl of Mansfield, was particularly good, and amongst the less common kinds we might include the curious *Fitzroya patagonica*, the little known *Pinus aristata*, *Retinospora obtusa* (Club-moss like), the most curious and distinct abnormal form of Conifer that we have ever seen, the Umbrella Tree (*Sciadoopytis verticillata*), and *Juniperus rigida*.

Mrs. Malcolm, The Cairnets, Perthshire, contributed a large number of Silver Firs (*Abies*), but the method of naming was most objectionable, and would not permit of the scrutiny of the well-grown and healthy specimens.

Sent by Messrs. Dicksons of Chester, was a neat and most interesting collection of twigs and cones, mostly collected at Penrhyn Castle in Wales, and including large fruiting branches of *Abies Webbiana*,

FIG. 57.—PLAN OF THE CONIFER GARDEN AT CHISWICK. (SEE LEADER PAGE.)

blue, $1\frac{1}{2}$ inch in diameter; *A. Maacke*, lilac, bright-yellow disc; *A. versicolor*, pink and white flower; *A. vimineus*, numerous white flowers, in pendulous racemes; *A. Bigelowi*, bright purplish-blue, with a relatively large brown disc. *Boltonia asteroides*, var. *decurrens* has pink-coloured rays, and a yellow disc. Other plants in this exhibit were *Cosmos bipinnatus*, a Mexican plant, with bright purple single flowers, which are terminal; *Lobelia tupa*, a tall spike of sparsely-disposed red flowers. *Rudbeckia speciosa*, *R. purpurea*, and *R. bicolor* were present, the first and last yellow, the other purplish-rose coloured rays; *Helianthus giganteus*, *H. multiflorus*, and *Silphium perfoliatum*, a robust plant, with a tall spike of orange and yellow flowers.

From Mr. W. C. Dod's garden, Malpas, Cheshire, came a good collection of Asters, consisting chiefly of those we had noticed in the Kew collection, besides several not contained therein, as *Aster Robert Parker*, a fine regular flower, $1\frac{1}{2}$ inch across, with pale lilac florets and yellow disc; *A. cordifolium* var. *Fota*, pale lilac free flowers 1 inch wide; *A. nudulatus*, *A. Drummondii*, pale lilac; several forms of *A. Amellus*, some seedlings raised at Malpas, also collected wild, probably garden escapés; and *A. versicolor* var. *discolor*; and *A. pyrenaicus*, large twisted rays.

From the Society's garden were forms of *Aster Novi Belgii*, a decorus, with bright lilac, flattish rays; *nana*, small lilac flowers; *formosus*, light

living specimens of the rarer and more decorative Conifers, fruiting branches, seeds, and a few specimens of wood, have been forwarded from almost every part of the British Isles, these together forming a most valuable and interesting collection, and one that is of the greatest value from a scientific and practical standpoint.

One could not fail to notice how fresh and well grown were the Scottish collections; indeed, the specimens sent from Perthshire and the adjoining counties revealed a depth of leaf-colouring and solidity of growth that we cannot remember to have seen equalled. England comes well to the front in the many rare and little-known forms of Conifers that were exhibited; while from that peculiarly favoured spot in the south of Ireland—Fota Island—were sent specimens of branches, and cones that will do much to settle some knotty points in the minds of Conifer lovers who will have the advantage of observing such rarely-seen fruits of Coniferae.

Altogether, the Conifer Conference may be taken as a grand success, the only drawback being that, owing to the loads of specimens that kept turning up, sufficient space for their being fully and clearly exhibited individually could not be obtained; however, the confined space rendered it all the easier for those persons who were interested in such to fully examine and compare the allied specimens.

From Sir P. K. Murray, of Ochtertyre, N.B., was sent a most valuable representative collection of the

A. nobilis, *A. cephalonica*, *A. grandis*, with both male and female cones attached; *Pinus Pinea*, very fine; *Cupressus macrocarpa*, *C. nutkansis*, and a very large cone and branch of *Araucaria imbricata*.

The Earl of Devon sent many beautiful kinds, including the largest fruiting branch of *Pinus excelsa* that we have yet seen; *Cedrus Deodara* in cone, and the seldom-seen Plum-fruited Yew (*Cephalotaxis drupacea*), and which I would recommend every one who is interested in Conifers to closely examine.

A very interesting collection came from the Duke of Devonshire, including *Picea orientalis*, *A. Nordmanniana*, *Pinus montana* and *monticola*, and the pretty *Abies canadensis*—the Hemlock Spruce.

The conspicuous cones of *Pinus Ayacahuite*, sent by Mr. Jeffries, of Cirencester, and grown at Weston-birt, in Gloucestershire, by R. L. Holford, Esq., were of particular interest, and showed us that, as well as in the Isle of Man, this distinct Pine can be successfully grown in this country.

Her Majesty the Queen had sent from Balmoral not a few samples of the less common kinds of Conifers, and these took in *Abies bifida*, in cone; *Pinus aristata*, *Abies grandis*, *A. Albertiana* (in cone), *A. concolor*, *A. Alcoquiniana*, *A. Douglasii glauca*, *Juniperus suecica*, *Abies nobile glauca*, *Pinus parviflora*, *P. Jeffreyi*, and some others of less note. The examples of Larch from home-saved and Tyrolean seed, were worthy of inspection by every planter, and clearly told their own tale.

From the Earl of Hopetoun and the Countess of Seafeld were sent very fine forms of many species of Conifers, which may also be said of those kindly forwarded by F. S. H. Cornwallis, Esq., Linton Park, Maidstone, Sir F. Dyke Acland, the Duke of Sutherland, the Duke of Buccleuch, and the Earl of Aberdeen, and regarding which we shall have more to say on a future occasion.

The well-grown specimens sent by Smith-Barry, Esq., from Fota Island are most interesting, and consisted of specimens that we rarely have the pleasure of seeing. First came the very rare Cupressus Knightiana (in cone), Abies religiosa, a fine coning branch; Abies Brunonian, and Cedrus Deodara, with fully-grown and beautifully-coloured cones. Pinus parviflora, too, was sent, bearing a number of cones, as also Abies Webbiana, and Wellingtonia (Sequoia) gigantea.

To the Menabilly collection of Conifers (J. Rashleigh, Esq.), we are indebted for not a few fruiting branches of uncommon Conifers, and amongst those exhibited were Encephalotaxus Fortunei, Pinus patula, and the rarely seen Athrotaxis laxifolia.

The collections of growing specimens of various kinds of Conifer are most creditable to the various exhibitors, and showed at a glance what a wealth of colour, what variety in shape and foliage, and what a choice we have in Coniferous trees, both small and large. At present we can only just glance over the many beautiful representative collections that were sent by such eminent cultivators of Conifers as Messrs. Veitch & Sons of Chelsea; Mr. Anthony Waterer, of Knaphill; Barron & Son, Elvaston; Dicksons, Chester; Paul & Son; Jeffries, Cirencester; Mr. Charles Lee, and from Kew.

These valuable collections, and others of particular interest, will be dealt with at some future time.

List of Awards.

FOR GROUPS OF LIVING CONIFERS.

Silver-gilt Medals.

To Anthony Waterer, Knaphill; Messrs. J. Veitch & Sons, Chelsea.

Silver Medals.

To Messrs. C. Lee & Son, Hammersmith; Dicksons, of Chester; G. Paul & Son, High Beach.

Bronze Medal.

To Messrs. Cutbush & Son, Highgate, for groups of Conifers.

Bronze Medals.

To Messrs. Jeffries, of Cirencester; Cutbush & Son, of Highgate; W. Barrow & Sons, of Elvaston.

Vote of Thanks.

To Messrs. Fisher, Son & Sbray; The Royal Gardens, Kew. To Messrs. Little & Ballantyne, Carlisle, for group of Conifers.

FLORAL COMMITTEE.

First-class Certificates.

To Ixora macrothyrsa (Dull), shown by Sir Trevor Lawrence, Bart., M.P.

Awards of Merit.

To Carnation Lizzie McGowan, shown by Messrs. Pitcher & Manda. To Chrysanthemum Miss Watson, shown by Messrs. H. Cannell & Sons.

To Dahlia Prince Christian, shown by Messrs. Cannell & Sons. To Chrysanthemum Madame E. Lefort, shown by Mr. R. Owen.

MEDALS.

Silver Flora.

To Messrs. Collins Bros. & Gabriel, for collection of Hardy Flowers.

Silver Banksian.

To Messrs. Paul & Sons, for collection of Hardy Flowers. To Messrs. J. Laing & Sons, for collection of Hardy Flowers. To Mr. W. Salmon, for collection of Hardy Flowers.

Bronze Banksian.

To Messrs. W. Cutbush & Sons, for collection of Hardy Flowers.

To Rev. W. DoI, for collection of Perennial Asters, &c.

ORCHID COMMITTEE.

First-class Certificates.

To Lælia Perinei alba, shown by Baron Schroder.

Award of Merit.

To Cattleya aurea marmorata, shown by G. O. Sloper, Esq., Highworth, Wilts.

Cultural Commendation.

To Cypripedium Sanderianum, shown by T. A. Bevan, Trent Park, New Barnet.

FRUIT COMMITTEE.

Silver Medal.

To Mr. Reynolds, Gunnersbury, for thirty-six Melons.

Awards of Merit.

To Mr. J. Hunter, Lambton Castle Gardens, Durham, for five Pine-apples. To Royal Horticultural Society's Gardens, for Muscat of Hungary.

PRESTON AND FULWOOD FLORAL AND HORTICULTURAL.

The monthly meeting of members was held on Saturday, October 3, at the Old Legs of Man Hotel, Preston, and the collection of plants, fruits, and cut flowers, was much larger than usual. Mr. S. H. Scott,

in the course of a speech he made, said the monthly exhibitions were becoming more and more important; and as many seedlings made their first appearance there, he proposed that two or three non-exhibitors do go round and suggest what plants and flowers should receive the Society's certificates. This was agreed to, and the 1st prize was awarded to Mr. Hathaway (gr. to the Earl of Latham) for a new single Dahlia.

Mr. S. Ware, of Hale Farm Nursery, Tottenham, was awarded a Certificate for sixty-two bunches of herbaceous flowers; and Mr. John Wilding, of Walton-le-Dale, obtained another Certificate for forty-eight double show and fancy Dahlias, six Cactus Dahlias, and sixteen single Dahlias. Mr. Hathaway read a paper on "The Culture of Chrysanthemums," and a discussion followed.

NURSERY NOTES.

TABLE PLANTS AT MOORLAND NURSERY, NORWOOD.

DRACENAS are the chief specialty of Mr. C. F. Bause, of Moorland Nursery, Portland Road, South Norwood, S.E. There were about 13,000 in number in 32-pots. We noticed the following varieties as being particularly good:—Frau Marie Metzsch, green, with broad crimson margins; Salmonia, dark and light green stripes, salmon edges; Cinnabarina, similar, but narrow leaves; Norwoodiana, bright red, and dark green; Madame Bergman, a broad leaf red variety, of great value for market purposes; Barteli, very dark green, with crimson; Mastersiana, leaves 4 inches broad, edged brilliant crimson, beautiful habit; Rossi, one of the best, the ribs well marked. Thousands of the variety pendula are grown, its broad deep brown-crimson arching leaves being well known.

Caladiums also form an important item here. He has several new kinds, which recently received Certificates from the Royal Horticultural Society:—Mons. Léon Say, crimson, mottled with green and rose spots; Michel Buchner, rich carmine-crimson, with deeper veins, perhaps the richest of all; Madame Ed. Pynaert, metallic crimson, with carmine veins; John Laing, broad yellow broader, with feathered crimson centre; Louis A. Van Houutte, dark metallic-crimson, with black petioles.

Two large houses are devoted to Aspidistras. Before being sent to market, these are repotted, the plants being made into a good shape, straggling plants not being saleable. The green variety is preferred for restaurants to place on white marble.

Cocos Weddelliana, Geonoma gracilis, Kentias, Phoenix rupicola (many thousands), are grown to various sizes; dwarf compact plants of various Nepenthes, beautiful little Crotons and Bertolonias, as well as other well-known ornamental foliage plants, make up a collection of plants which find a ready sale in the London and Paris markets.

MARKETS.

COVENT GARDEN, October 8.

SUPPLIES falling off, Kent Cobs selling pretty freely at 35s. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Asters, French, etc.), quantities (dozen bunches, per dozen, etc.), and prices (s.d., s.).

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantums, Aralias, etc.), quantities (per doz., per dozen, etc.), and prices (s.d., s.).

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Damsons, etc.), quantities (per doz., per case, etc.), and prices (s.d., s.).

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Beans, etc.), quantities (per doz., per bushel, etc.), and prices (s.d., s.).

POTATOS.

Arrivals are not quite so heavy; market firm for best samples at previous quotations. J. B. Thomas.

SEEDS.

LONDON, Oct. 7.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that Clover seeds just now are being quite left alone by the trade. Perennial Rye-grasses are a trifle cheaper. There is no change in imported Italian. Choice new winter Tares and seed Rye are now obtainable in London on exceedingly moderate terms. For Trifolium there is still a small sale. Mustard and Rape seed move off slowly on former terms. Hemp seed is dull; but in Canary seed a hardening tendency is observable. There is a brisk inquiry for blue Peas at advancing quotations; the supply just now falls short of the demand. Haricot Beans continue cheap. Feeding Linseed is steady.

FRUITS AND VEGETABLES.

SPITALFIELDS: Oct. 6.—Quotations:—English Apples, 2s. 6d. to 5s. 6d. per bushel; Pears, 1s. 6d. to 2s. per half-sieve; English Tomatoes, 6s. to 7s. per 12 lb.; foreign do., 9d. to 1s. 6d. per box; Prune Plums, 2s. to 3s. per half sieve; Damsons, 2s. 3d. to 2s. 6d. do.; Bullaces, 1s. to 1s. 6d. do.; Seakale, 1s. 3d. to 1s. 6d. per punnet; Cabbages, 1s. 6d. to 3s. per tally; Savoys, 2s. to 3s. 6d. do.; Greens, 1s. to 2s. per dozen bunches; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. 3d. to 2s. per half-sieve; Turnips, 2s. to 2s. 6d. per doz. bun.; Cauliflowers, 3s. to 3s. 6d. per tally; Scarlet Beans, 1s. to 1s. 3d. per bushel; Carrots, 1s. to 2s. 6d. per dozen bunches; do. 20s. to 40s. per ton; Endive, 1s. to 1s. 3d. per dozen; Cos Lettuce, 4d. to 8d. per score; Cabbage, do. 2d. to 4d. per dozen Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Leeks, 1s. 9d. to 2s. per doz.; English Onions, 4s. to 4s. 6d. per cwt.; Belg'ar, do. 2s. to 3s. per bag of 110 lb.; Dutch do. 3s. to 3s. 6d. do.; Spanish do. 6s. to 7s. per case; Marrows, 3s. to 4s. per tally; Celery, 6d. to 10d. per bundle; Parsley, 1s. to 12s. 6d. per dozen bunches; Horseradish, 1s. to 1s. 2d. per bundle; frame Cucumbers, 1s. 6d. to 2s. 9d. per dozen; do. natural, 6d. to 8d. per dozen; Radishes, 2s. to 2s. 6d. per tally; Beetroots, 1s. 6d. to 2s. per dozen bunches.

STRAFORD: Oct. 6.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 3s. per tally; Savoys, 3s. to 4s. do.; Cauliflowers, 9d. to 1s. per dozen, and 3s. to 4s. 6d. per tally; Turnips, 1s. 6d. to 2s. 6d. per dozen; do. 30s. to 40s. per ton; Carrots, household, 30s. to 40s. do.; do. cattle-feeding, 25s. to 27s. 6d. do.; Mangels, 16s. to 18s. do.; Swedes, 20s. to 25s. do.; Onions, English, 80s. to 90s. do.; do. Dutch, 3s. 3d. to 3s. 6d. per bag; do. Ports, 5s. 9d. to 6s. 6d. per case; Apples, English, 2s. to 6s. per bushel; Scarlet Beans, 1s. to 1s. 6d. per sieve; do. 2s. to 2s. 6d. per bag; Damsons, 1s. 6d. to 2s. 3d. per half-sieve; do. 3s. to 4s. 6d. per flat; Plums, 1s. 6d. to 4s. per half-sieve.

BOROUGH: Oct. 6.—Quotations:—Cabbages, 2s. to 5s. per tally; Broccoli, 3s. to 4s. do.; Turnips, 1s. 6d., and Carrots, 1s. to 1s. 6d. per dozen bunches; Scarlet Beans, 1s. to 1s. 6d. per bushel; French do., 1s. do.; Apples, 2s. to 6s. do.; and William Pears, 2s. to 6s. do.

POTATOS.

SPITALFIELDS: Oct. 6.—Quotations:—Magnams, 7s. 6d. to 60s. per ton; Regents, 55s. to 65s.; Imperators, 60s. to 70s.; Hebrons, 55s. to 70s.; Early Rose, 50s. to 75s.

BOROUGH: Oct. 6.—Quotations:—Regents, 7s. to 80s.; Hebrons, 60s. to 80s.; Imperators, 60s. to 70s.; Magnams, 60s. to 70s. per ton.

STRAFORD: Oct. 6.—Quotations:—Magnams, 55s. to 80s.; Imperators, 55s. to 75s.; Hebrons, 60s. to 70s.; Elephants, 55s. to 75s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Oct. 3, and for the corresponding period in the previous year:—1891, Wheat, 31s. 4d.; Barley, 28s. 10d.; Oats, 18s. 5d. 1890, Wheat, 31s. 2d.; Barley, 29s. 5d.; Oats, 17s. 4d. Difference, Wheat, +3s. 2d.; Barley, —1s. 5d.; Oats, +1s.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 40s. to 75s.; hay, beat, 80s. to 92s.; do., inferior, 26s. to 50s.; and straw, 20s. to 40s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 3, is furnished from the Meteorological Office:—

"The weather has been generally fine and bright over all the more southern and south eastern parts of the Kingdom, but in the west and north, cloudy skies and frequent falls of rain have been experienced.

"The temperature has just equalled the mean in 'England, S.W.,' but in all other districts it has been above, the excess in nearly all cases having been 2°. The highest of the maxima were generally recorded on Sept. 28, when the thermometer rose to 70° in 'England, E.,' to 69° in the 'Midland Counties' and 'England, S.,' to 68° in 'Scotland, E.,' and the 'Channel Islands,' and to between 63° and 67° elsewhere. The lowest of the minima were registered either on Oct. 2 or 3, and ranged from 29° in 'Scotland, N.,' 30° in 'Scotland, E.,' and 33° in 'England, S.W.,' to 40° in 'England, N.E.,' and to 47° in the 'Channel Islands.'

"The rainfall has been more than the mean in 'Scotland, N. and W.,' as well as in 'England, N.W.,' but in all other districts it has been less than the normal.

"The bright sunshine has exceeded the mean in most parts of the country, but shows a deficit in 'England, N.E.,' 'Scotland, W.,' and 'England, N.W.' The percentage of the possible amount of duration ranged from 69 in 'England, S.,' 64 in the 'Channel Islands,' and 62 in 'England, E.,' to a little more than 40 in the 'Midland Counties,' 'England, S.W.,' and 'Ireland, S.,' and to between 19 and 27 over the north-western and northern districts.

NOTICES TO CORRESPONDENTS.

CARNATION LEAVES: J. B. R. The appearances are due to some mining insect, which has disappeared. Send living specimens and leaves again.

CORRECTION: In reply to "W. J. S.," for "Seku," read "Seckle."

FUNGUS: C. W. D. The fungus is *Peziza aurantia*, a common species. The "puffing" is common to most members of the group, and is caused by the liberation of clouds of mature spores. The emission of spores is due to the hygroscopic property of a certain layer of tissue, hence the cloud following breathing, G. M.

LANDSCAPE GARDENING: Two of the earliest books on this subject—if not the earliest—are that of Batty Langley in 1728, and Whately's *Essay on Modern Gardening* (1770).

MALFORMED MUSHROOM: J. H. Not uncommon.

NAMES OF FRUITS: G. L. 1, Annie Elizabeth; 2, Margil; 3, Beurré Hardy; 4, Marie Louise; 5, General Todtleben.—A. V. E. 1, Soldat Esperen; 2, Blenheim Orange; 3, Duke of Devonshire.—W. W. 1, Peach; 2, Flemish Beauty; 2, Beurré d'Amanlis; 4, Beurré de Capiaumont; 5, Goff.—J. H. E. Plum Greengage, so far as we could make out.—R. J. J. 2, King of the Pippin; 3, Gloria Mundi; 5, Cockle's Pippin; 6, Besspool; 8, Boaton Russet; 9, Hawthornden; 10 and 12, Dumelow's Seedling; 11, Court of Wick.

NAMES OF PLANTS: G. H. P. A wretched specimen of some *Gaillardia*.—W. M. *Bagshot*. *Pyrus Aria*, the White Bean.—*Justus C.* A species of Lichen—*Cladonia*.—R. T. 1, *Sericographis Gbiesbrechtiana*; 2, *Escallonia rubra*; 3, *Ampelopsis serjaniefolia*; 4, *Pellionia daveana*; 5, *Sedum carneum variegatum*; 6, *Acacia atkinsii*; 7, *Skimmia Fortunei*.—*Cupid*. *Maxillaria picta*.—W. K. *Rosa viridiflora*.—H. W. *Lelia Perrii nivea*, if the segments keep white.—*Harris*. 1 and 2, forms of variegated Yew; 3, *Cephalotaxus pedunculata fastigiata*; 4, *Juniperus virginiana aurea*; 5, *Retinospora dubia*; 6, *R. ericoidea* of gardens; 7, probably a form of *Biota orientalis*; 8, *Thunopsis borealis*.

NOTICE TO LEAVE SERVICE: G. S. Not knowing all the circumstances, we cannot advise you.

OAK LEAVES: F. C. E. The leaves are covered with galls, commonly called Oak Spangle, which are caused by a gall mite, *Neuroterus lenticularis*, puncturing the leaves.

PLATANUS OCCIDENTALIS: J. R. The tree would succeed at Colwyn Bay, but if the situation is much exposed to sea breezes, the common *Sycamore* would be a more suitable tree to plant.

TACSONIA VAN VOLXEMI: Miss F. Discovered by the late M. Baptiste Joseph Van Volxem, in New Granada. It will succeed in the stove or warm Greenhouse. With winter protection it might be cultivated on a south wall outside, in our warmer districts. It is worthy of a trial.

YELLOW-FLOWERED PANCRATIUM: X. This was mentioned in a recent communication, but we suspect some other genus was intended, as there is no yellow *Pancretium* known.

COMMUNICATIONS RECEIVED.—J. Pentland Smith, letter forwarded to person named.—Haworth.—J. C.—W. H.—E. J. R.—W. E. G.—E. J. B.—A. D. W.—A. W.—Ch. D. B. S. M.—J. K. Rudde.—C. E. M.—E. C.—J. Q.—W. E. For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 70°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) A. MACKENZIE," of Messrs. Methvea & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO.,** Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS AND SON,** 157, Queen Victoria Street, London.

"Nothing Succeeds like Success."

HUGHES' (SOLUBLE) INSECTICIDE
FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

G. H. RICHARDS, Horticultural Merchant, 1, Belvedere Crescent, Lambeth, London, S.E.

Two out of many Testimonials.

"It affords me very much pleasure to inform you that the ORCHID PEAT I had from you last autumn has given every satisfaction, whilst being largely composed of good equid fibre, it has at the same time, a fair proportion of rich light peaty matter, such as Orchids invariably grow luxuriant in. It is very lasting, and there is no risk of it becoming sour by over-watering."—**JOHN JACQUES,** Waddesdon Gardens, Aylesbury.

"C. INGRAM, Esq., and myself, are more than satisfied with the ORCHID PEAT which you have supplied."—**T. W. BOND,** The Gardens, Elstead House, Godalming.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION. — *Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.*—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

FARMS, ESTATES, RESIDENCES.

BUYER, or SALESMAN.—Age 21; seven years' experience in Covent Garden Market; also well up in Nursery and Shop Trade.—H. J. HARPER, 7, Westbury Road, Forest Gate, E.

TO FLORISTS, &c.—Young Lady, experienced, requires situation. Well up in Wreaths, Bouquets, &c. Good references.—E. J., Barbourne Nurseries, Worcester.

FLORIST and SEED TRADE.—A young Lady, having several years experience, wishes re-engagement in above. No objection to temporary engagement.—A. B., 68, Great George Street, Liverpool.

TO FLORISTS.—Wanted, by young Lady, Management of first class Florist's Business. Thoroughly experienced.—F. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS and OINTMENT.—Dyspepsia, Jaundice.—These complaints are the results of a disordered liver, which secretes bile in quality or quantity incapable of digesting food. Digestion requires a free flow of healthy bile, to insure which Holloway's Pills and Ointment have long been famous for eclipsing every other medicine. Food, irregularity of living, climates, and other causes are constantly throwing the liver into disorder, but that important organ can, under all circumstances, soon be regulated and healthily adjusted by Holloway's Pills and Ointment, which act directly upon its vital secretion. The Ointment rubbed on the skin penetrates immediately to the liver, whose blood and nerve it rectifies. One trial is all that is needed; a cure will soon follow.

Kent: The Garden of England.

GEO. BUNYARD & CO., THE "OLD" NURSERIES, MAIDSTONE.

SPECIALITY: FRUIT TREES. | **EXTENSIVE General NURSERIES.**
TRUE TO NAME. | FOR ALL HARDY SUBJECTS.

LIBERAL TERMS, FREE CARRIAGE, AND DISCOUNT FOR CASH.

G. B. & Co. beg to call attention to the following, full particulars of which can be found in their New CATALOGUES. No starvelings. Free from blight. Inspection earnestly solicited. Every gardener and amateur should see the stock.

G. B. & CO.

Beg to notify that their supply of FRUIT TREES for this season's delivery is the best ever grown at Maidstone or elsewhere, and no pains have been spared to ensure all being true to name. The extensive collection (embracing 800 kinds in 500,000 examples) fortunately escaped the severe frosts, and is in consequence healthy and vigorous, free from Canker, Blight, and Disease, and presents that wealth of foliage, with sturdy growth, that characterises the Maidstone Fruit Trees.

APPLES embrace Specimen Espaliers, Orchard Standards, New Amateur's Standards and own-root trees, Fruiting Double and Single Cordons on Paradise, Pyramids on Paradise, and Bushes: for flavour, crop, novelty, and exhibition.

PEARS—Standards, Horizontal Trained, Pyramids and Cordons on best Quince stock. All the very finest sorts.

PLUMS—Extra Standards, Half Standards, Fruiting Pyramids, Wall Trees, and Cordons.

DAMSONS—The wonderful Kent sort, Farleigh Prolific and others, Standards, and Half Standards.

CHERRIES—Fan-trained, Standard Trained, Kent Orchard Standards, Pyramids and Cordons on Mahaleb.

PEACHES and NECTARINES—Fine Rider - Trained Trees, 2 to 6 feet stems, Orchard House Trees, Clean Fan-trained Dwarfs, usual and extra sizes, best for size and flavour.

CRABS—Dartmouth and best ornamental kinds.

RASPBERRIES—The grand Superlative, &c.

CURRANTS—Red and White.

BLACKBERRIES.

GOOSEBERRIES—200 sorts, Big Lancashire, and flavour kinds.

MULBERRIES and MEDLARS.

KENT COB NUTS and FILBERTS.

QUINCES and RHUBARB.

STRAWBERRIES a Specialty. (Special Descriptive and Cultural LISTS.) Silver Medal of Royal Horticultural Society.

WALNUTS—Large Trees and Pyramids.

FIGS in pots, extra size, and Standards.

VINES—finest sorts for Glass Houses. Hardy kinds in Pots.

ORCHARD HOUSE TREES, established in pots: Apples, Pears, Plums, Peaches, Nectarines, and Figs, in best flavoured kinds. First Prize, Crystal Palace.

THE new DESCRIPTIVE FRUIT CATALOGUE now ready, a *vade mecum* for all Gardeners and Amateurs. Six Stamps, post-free. Special Cultural Articles, detailed LIST free.

General Nursery Stock covers about 40 acres, and all the **CON FERÆ, PARK TREES, RHODODENDRONS EVERGREENS, FOREST TREES, FLOWERING SHRUBS** are fully described in their CATALOGUES; all the most useful and lovely kinds are grown and kept in first-rate order for removal. Miles of Ornamental Borders to select from.

GENTLEMEN LAYING OUT NEW GARDENS, or improving their Estates, will find the Stock well worth their attention.

LANDSCAPE GARDENING in all its branches: **PLANS** and **ESTIMATES** prepared and carried out by contract, or commission, by an experienced professional.

ROSES make grand roots in the Maidstone soil, and success is certain on removal; all the best H.P., Tea, Moss, China, Japanese, and all kinds of Rose species are well-grown. Pot Roses, Climbers, Standards, and Dwarfs, see CATALOGUE.

TESTIMONIALS—Many thousand letters of commendation have been received from all parts, and these well-known Nurseries have been frequently described in the Horticultural Press, and have earned a reputation, which the present proprietors spare no pains shall be deserved and maintained; while the grand Prize examples of hardy fruits shown at the Crystal Palace, Edinburgh, Manchester, Exeter, Birmingham, Chester, Reading, Winchester, Croydon, Brighton, Shrewsbury, Guildhall (London), Sheffield, &c., have been the admiration of all.

"Fruit Farming for Profit," new edition, enlarged and illustrated, considered the best manual on this important subject, post-free, 2s. 9d.; for Colonies or Continent, 3s.

Frequent Trains by South-Eastern Railway (Charing Cross and Cannon Street to Maidstone), or Chatham and Dover (Ludgate Hill and Victoria), to Barming (for Fruit Nursery). For Routes, see CATALOGUE.

Direct a'l Letters as above. Telegrams—**GEORGE BUNYARD, MAIDSTONE.**

THE SUTTON ANEMONE. A GREAT NOVELTY.—We have the honour of offering for the first time the most brilliant Single Anemone yet raised. The flowers resemble those of *A. fulgens* in form, but they are much larger, and more imposing in appearance. The principal charm, however, consists in the harmony of colours, the broad petals being chiefly of a dazzling crimson-scarlet, with a base of old gold, upon which the dense mass of bluish-black anthers are displayed with remarkable effect. Price 1s. each, 10s. 6d. per dozen.

GENUINE ONLY DIRECT FROM
SUTTON AND SONS, The Queen's Seedsman, READING.

Dutch Flower Roots.—Carriage Paid.
DICKSON AND ROBINSON'S CATALOGUE, specifies all the best varieties in first-size Bulbs at moderate prices. Post free.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to **SELL** by AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on **TUESDAY, October 20**, at half-past 12 o'clock, without reserve, the whole of the above collection of **ESTABLISHED ORCHIDS**, containing about 140 plants. The collection includes a choice assortment of **Masdevallias, Cymbidium Lowianum, Oncidium Kramerianum, Laelia anceps albata, Cypripedium Crossianum, C. amandum, Cattleya Trianae** alba, C. Mossie, C. trianae bella, **Epidendrum prismatocarpum, Cattleya Trianae atalanta, Celoegia asperata,** also **Odontoglossums, Oncidiums, Dendrobiums, Cypripediums,** and **Cattleyas**, in the usual variety.

On view morning of Sale, and Catalogues had.

Wednesday Next.

200 AZALEA INDICA and **100 CAMELLIAS**, selected varieties; and **100 AZALEA MOLLIS**, from one of the best growers in Belgium.

MESSRS. PROTHEROE AND MORRIS will include the above consignment of plants in their **SALE** on **WEDNESDAY NEXT**.

On view morning of Sale, and Catalogues had.

Wednesday Next.

407,000 KENTIA SEEDS, The largest consignment ever received and offered in one day, consisting of

218,000 KENTIA FORSTERIANA.
189,000 " BELMOREANA.

MESSRS. PROTHEROE AND MORRIS beg to announce that they will include the above enormous consignment of **KENTIA SEEDS** in their **SALE** on **WEDNESDAY, October 21**.

On view morning of Sale, and Catalogues had.

The Auctioneers will be pleased to purchase on behalf of Provincial and Continental Buyers who may be unable to attend.

Friday Next.—Established Orchids.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT, October 23**, at half-past 12 o'clock, a Private Collection of **ESTABLISHED ORCHIDS** from the Midlands, containing about 550 Plants, including **Dendrobiums, Odontoglossums, Cattleyas, Cypripediums, Cymbidiums,** and others. **ODONTOGLOSSUM CRISPUM** and **CYPRIPEDIUMS** from another Collection.

Also **IMPORTED AND ESTABLISHED ORCHIDS**, from Messrs. Shuttleworth, Curder & Co., a new **CALANTHE, LISCHILUS,** new **ANGRECEUM,** and other Property.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their **SALE OF ORCHIDS**, on **FRIDAY NEXT, October 23**, **CALANTHE**, new species, a fine and totally distinct species, and a great acquisition to gardens. It has stout, columnar, above ground pseudobulbs, and fine ornamental foliage. The flower-spikes, which are as stout as a Cedar pencil, are 2 feet to 3 feet in height, and bear large heads of pure white, or, in some varieties, rose-coloured.

Also some plants of a grand large yellow and purple **LISCHILUS**; a fine **Sarcopodium**, with large yellow and crimson flowers; the new **Angreecium Saundersii**; **Oncidium citrinum**, and several species of **Eulophia**.

On view morning of Sale, and Catalogues had.

Liverpool.

GREAT UNRESERVED CLEARANCE SALE of well-grown **NURSERY STOCK**, by order of the executors of the late Mr. George Cunningham (Messrs. George Cunningham & Son), in consequence of the Land being required to be cleared for Building purposes.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION, on the Premises, The Oak Vale Nursery, Old Swan, Liverpool (10 minutes' walk from Broad Green Station, L. & N. W. Ry.), on **MONDAY, October 19**, and three following days, at 12 o'clock precisely each day, the first portion of the well-grown and valuable **NURSERY STOCK**, comprising great quantities of Trees and Shrubs, 1 to 6 feet; splendid Specimen Variegated and Green Hollies, 2 to 6 feet, embracing nearly all the hardy varieties in cultivation; several hundreds of Silver and other varieties, 4 to 9 feet; a large assortment of Deciduous Flowering Trees, Shrubs, thousands of Rhododendron ponticum, Oval-leaved and Common Privet and Common Hollies, suitable for Hedges; large quantities of Fruit Trees, 4 to 10 feet; 30,000 strong transplanted Quick; together with a fine collection of Fruit Trees.

The Stock may be viewed any day prior to the Sale. Catalogues can be obtained on the Premises, and of the Auctioneers, Estate Agents, and Valuers, 67 and 68, Cheapside, London, E.C.

Note.—The Valuable Freehold Building Estate of about 13½ acres, with the important and extensive Frontages to Broad Green and Nursery Road, ready for immediate development, is for Sale by Outside Treaty. Particulars of the Auctioneers.

Windsor Nurseries, Bagshot, Surrey.

GREAT ANNUAL SALE of the exceedingly well-grown **NURSERY STOCK**, carefully prepared for removal, and lotted to suit the Trade and large Buyers, by order of Mr. Richard Mason, whose reputation as a Grower of Nursery Stock is so well-known.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION, at the Windsor Nurseries, Bagshot, Surrey, twenty minutes' walk from Bagshot, and 2½ miles from Sunningdale, Stations, on **MONDAY, October 19**, and three following days, at 12 o'clock precisely each day, several Acres of exceptionally well-grown **NURSERY STOCK**, comprising:—

- 5,000 hybrid Rhododendrons to name, 1½ to 2 feet.
- 3,000 Andromeda floribunda, well set for bloom
- 1,000 Azalea pontica, 1½ to 2 feet
- 10,000 Rhododendron ponticum, 1½ to 3 feet
- 5,000 Berberis aquifolium
- 2,000 Berberis Darwinii
- 2,000 Pinus austriaca, 2½ to 4 feet
- 1,000 Spruce Firs, 2½ to 8 feet
- 1,000 Pinus strobus, 5 to 9 feet
- 2,000 Portugal Laurels
- 2,000 Colchicum Laurels, 3 to 5 feet
- 5,000 Oval-leaved Privet, 2½ to 4 feet
- 4,000 Thuia Lobbiai, Abies, Thuiopsis borealis, and Cedrus, 2 to 7 feet
- 10,000 strong Quick
- 1,000 Coniferæ and Ornamental Trees, 1 to 10 feet

10,000 Retinospora plumosa aurea, beautifully coloured, and others suitable for potting and boxes; 10,000 Cupressus Lawsoniana, 2 to 6 feet; 500 erecta viridis, 3 to 3½ feet; Fruit Trees, and other Stock.

The Auctioneers will be pleased to execute Commissions for Gentlemen who cannot attend, and Mr. Mason will lift and forward any lots.

May be viewed. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Wimbledon.—Expiration of Lease.

CLEARANCE SALE of about 4½ acres of exceptionally well-grown and thriving **NURSERY STOCK**, growing upon a portion of the Nursery the lease of which is about to expire, by order of Messrs. D. S. Thomson & Sons.

IMPORTANT TO MARKET GARDENERS, GENTLEMEN, NURSERYMEN, and OTHERS.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION on the Premises, The Nurseries, Wimbledon, about five minutes' walk from Wimbledon Station, on **MONDAY and TUESDAY, October 26 and 27**, at 12 o'clock precisely, Without Reserve, 8000 Standard and Pyramid Apples, Pears, and Plums, 350 Standard Cherries, 800 Dwarf-trained Apples, Pears, and Cherries, 5,000 Currants and Gooseberries, 2,000 Laurels, of sorts, 1,500 Weymouth and Austrian Pines, 900 broad-leaved Privet, 200 Green Hollies, 3 to 4 feet, 160 well-furnished English Yews, 4 to 5 feet, 900 Standard and half-standard Roses, 1,700 Border Shrubs, in variety, 4 to 7 feet, 1,300 Limes, 8 to 11 feet, fine Avenue trees with short stumps, 40 Lombardy Poplars, well furnished, 12 to 15 feet, 300 Standard Planes, Thorns, and other Ornamental Trees, &c.

May be viewed any day (Sunday excepted) prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Cheshunt.

ABSOLUTE CLEARANCE SALE of unusually well-grown **NURSERY STOCK**, in consequence of the expiration of the Lease of this Branch Nursery. By order of Messrs. Paul & Son.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to **SELL** by AUCTION, on the Premises, The Church Fields Nursery, Cheshunt (one mile from Cheshunt Station), on **WEDNESDAY and THURSDAY, October 28 and 29**, at 12 o'clock precisely each day, without reserve, about 12 acres of unusually well-grown **NURSERY STOCK**, in the best possible condition for removal, consisting of—

- 20,000 AVENUE TREES, 10 to 25 feet, with straight stems, carefully transplanted, and
- SPECIALLY ADAPTED FOR STREET PLANTING,** including
- 10,000 LIMES, with good heads,
- 5000 Spanish and Horse CHESTNUTS, POPLARS, OAKS, and PLANES,
- 5000 BOX, large quantities of oval-leaved PRIVET, Scotch ROSES,
- 10,000 BUSHY ACUBAS, 1 to 5 feet, undoubtedly the best lot in the Trade.

Specimen RHODODENDRONS, ARAUCARIAS, and variegated HOLLIES, Dwarf-trained and Pyramid FRUIT TREES, CURRANTS and STRAWBERRIES, of the best sorts, RASPBERRIES, and NUTS.

THE FINEST COLLECTION OF FLOWERING SHRUBS IN THE COUNTRY.

Including the New Dwarf Flowering and Double LILACS, THOUSANDS OF EVERGREENS, suitable for London and Suburban Gardens; and other Stock.

May be viewed any day (Sundays excepted) prior to the Sale. Catalogues may be had on the Premises, of Messrs. PAUL and SON, The "Old" Nurseries, Cheshunt; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

NOTE.—The opportunity afforded by this Sale to intending purchasers is unique. No Sale has ever been held at these Nurseries, the stock having been prepared without any idea of a public sale, which now arises solely through the expiration of the Lease of this Branch Nursery.

The Auctioneers desire to call the particular attention of Public Companies, Local Authorities, and others to the unrivalled and extensive Stock of Avenue Trees, Acubas, Evergreens, and Flowering Shrubs.

Ealing.—Expiration of Lease.

CLEARANCE SALE of about 11,000 CONIFERS and other **STOCK**, by order of Messrs. Hart Bros., whose Lease of this Branch Nursery will shortly expire.

HOTHOUSE BUILDERS and HOT-WATER ENGINEERS.

ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vinerias, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

L'HORTICULTURE INTERNATIONALE, Limtd.

Directors: Messrs. J. LINDEN and LUCIEN LINDEN.

PARC LEOPOLD, BRUSSELS, BELGIUM.

SPECIAL EXHIBITION OF CATTLEYA LABIATA AUTUMNALIS IN FLOWER.

OPEN on the 17th of OCTOBER, 1891, and FOLLOWING DAYS.

MESSRS. LINDEN wishing to answer victoriously to some polemics of an interesting nature, just raised, organise in the halls of L'HORTICULTURE INTERNATIONALE, Brussels, a

SPECIAL EXHIBITION, SHOWING MORE THAN 200 CATTLEYA LABIATA AUTUMNALIS IN FLOWER.

This magnificent show, UNIQUE OF THIS KIND till to-day, will certainly prove to everyone, and demonstrate also to the least perspicacious observers, the perfect identity of **CATTLEYA WAROCQUEANA** with the **OLD AUTUMN-FLOWERING CATTLEYA LABIATA VERA.**

ALL LOVERS OF ORCHIDS are heartily invited to visit this special exhibition, which is fully conclusive in the matter.

AMATEURS who have any old C. LABIATA AUTUMNALIS blooming now are requested to bring with them some fresh flowers of their plants, in order to have a comparison with the CATTLEYA WAROCQUEANA of the show.

The ORCHIDISTS will find there Cattleyas in flower with single or double sheaths, the one green, the others red; in many cases the same are simultaneously single or double on the same plant, frequently there are up to five flowers on each sheath in full blossom. They will find there an INNUMERABLE TREASURE OF VARIETIES of all shades, some of them being far superior in splendour and EXQUISITE BEAUTY to the most emergent types already known.

MESSRS. LINDEN say not that their CATTLEYA LABIATA AUTUMNALIS have been collected on the "SWAINSON'S HUNTING GROUND," which no one knows to-day; but they state that their plants are TRUE C. LABIATA AUTUMNALIS, who have PROVED THEIR GENUINENESS for two seasons in the most indisputable manner, and who demonstrate also their authenticity now by numerous plants in FULL BLOSSOM.

 **CAUTION.**—Messrs. LINDEN earnestly beg Amateurs, who have bought direct some plants of their introduction, to mark the same in a very reliable and distinct manner, as they would not care TO BE MADE RESPONSIBLE for the disappointment which may arise in the Spring of next year for the buyers of the plants recently imported in England, whose Importer says that "THEY ARE NOT THE SAME AS THOSE OF MESSRS. LINDEN."

WHO HAS SEEN IN FLOWER the imported Cattleyas recently sold for C. LABIATA AUTUMNALIS in England?

THEY WERE COLLECTED in summer by a collector who departed from Europe at the end of last spring.

COME TO SEE the SPECIAL EXHIBITION of L'HORTICULTURE INTERNATIONALE. There you will find TRUE and GENUINE CATTLEYA LABIATA AUTUMNALIS in flower.

The fact that L'HORTICULTURE INTERNATIONALE, in adopting the provisional name of CATTLEYA WAROCQUEANA until the plant should have proved, by two seasons' flowering, to be the true old CATTLEYA LABIATA AUTUMNALIS, has given GREAT CREDIT and CONFIDENCE to this Firm on all sides.

 **THERE IS NOTHING SENT OUT BY THIS FIRM UNTIL IT HAS PROVED GENUINE.** 

A grand lot of the TRUE CATTLEYA LABIATA AUTUMNALIS—plants in sheaths and in flower—will be SOLD by AUCTION, by Messrs. PROTHEROE AND MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, October 30, 1891.

SATURDAY, OCTOBER 17, 1891.

TEDWORTH HOUSE.

IT is possible that some persons might not expect to discover much picturesque beauty in the residence of the late T. Assheton Smith, "the Field-Marshal of Fox-hunting," as the Duke of Wellington called him—a Nimrod so devoted to the chase, that he followed the hounds six days a week, and, to enable him to do so, kept ninety couple of hounds at Tedworth, besides eighty more at work in different parts of Wales and Wilts. But the M. F. II. who erected the cottages at Tedworth, each with a tidy garden and a porch festooned with Roses and Honeysuckles, with the scarlet-fruited Pyracantha climbing the walls, must have possessed taste and good feeling.

The biography of the great fox-hunter shows him to have been a man of sterling merit, and the beauty of the house which he rebuilt, and of the grounds he formed around it, denote refined habits and tastes, and a true horticultural instinct. Energy was one of his leading characteristics. His motto, and the maxim which guided his conduct, was "*Quicquid vult, valde vult.*" In everything he undertook, ship-building as well as fox-hunting, the development of his slate quarries, or the amelioration of the condition of his Welsh labourers, he worked with all his heart. Fox-hunting may not be the most elevating pursuit a man can engage in, but it is not an ignoble amusement. It is healthful too. Dryden rightly says of it:—

"Better to hunt in fields for health unbought,
Than fee the doctor for a nauseous draught."

The lord of Tedworth and of the very valuable slate quarries at Vaenol, in the Menai Straits, possessed a heart somewhat tough perhaps, but the story of his big conservatory reveals its kindness. When Mrs. Smith declined the voyage to Madeira, which her doctors recommended, her husband provided for her use a conservatory which, with the glazed corridor from the house, measured 965 feet in length. "We will bring Madeira to England," he said. The conservatory itself was 315 feet long by 40 feet wide, and a broad walk of the finest gravel passed up the centre, having specimen plants on each side. The whole of this structure, nearly a quarter of a mile in length, was comfortably warmed, and here Mrs. Smith found a healthful promenade; and here, during the last winter of his life, the great foxhunter himself was accustomed to take daily rides from end to end. When this novel glasshouse had served its purpose, it was removed to Pokesdown, Bournemouth. Another conser-

TRANSVAAL NATIVE BULBS, TUBERS, SEEDS, &c.—The undersigned, late of the Botanic Gardens, Maritzburg, Natal, begs to inform his correspondents that he is now offering Novelties of Merit, collected by him, true to name. DUTCH FLOWER BULBS.
Miscellaneous, Bulbous, & Tuberous-rooted Plants.

THE NEW CATALOGUE (81st year), of these Articles (No. 509), of E. H. KRELAGE AND SON, NURSEYMEN, SEEDSMEN, and FLORISTS to the Court, Haarlem (Holland), has been published, and will be sent, post free, and without charge, to all who apply for it by prepaid letters, direct to

E. H. KRELAGE & SON, Haarlem, Holland.

vatory was built by Mr. Smith, forming a beautiful promenade 150 feet long, with a marble floor, leading from the house and ending in a circular recess, which is now decorated with Palms and Tree Ferns, while Geraniums, Fuchsias, and various creepers cover the walls.

Mr. T. Assheton Smith has been described, not inaptly, as a "miracle on horseback." At eighty years of age, he used to gallop down the steep slopes of the Wilts' Downs, joyous as a boy, and when shattered by illness, a little later on, he would mount his horse as long as it was possible for him to do so, and always seemed wonderfully revived in the saddle, though he was rather given latterly to falling off, the steeds he persisted in mounting being far too spirited for an aged and infirm rider. I have felt greater interest in this famous sportsman, and have given him more space here on account of the improved gardens which he formed at Tedworth, and his attachment to them. By his own desire, he was buried in his garden. Dying in 1858, at the age of eighty-two, he rests by the side of his attached wife in a mausoleum, erected on high ground, among the beautiful shrubberies on the west side of the house, a most peaceful spot, where, as I came reluctantly away, the ringdoves were cooing softly.

Tedworth House, with its beautiful park and the hills and woods around it, is now the property of Sir John Kelk, Bart. The handsome house, rebuilt by Mr. T. A. Smith when he succeeded to the family estate in 1826, has been much improved by the refronting of the building in the Italian style, and the erection of a new porch. It is a particularly handsome house, with two storeys and a balustrade, and a lawn and flower garden extending round its two best sides—on the south and east. On the south front, Bay trees in tubs, trained as pyramids, 10 feet high, are ranged along the wall, presenting a very stately appearance. The trees are removed in the autumn, and kept securely in a sort of annexe to the house on the west side. At the time the bedding plants are turned into their allotted borders and beds in May, the lawns on the south front are subjected to a transformation of a rather novel character. The number of bedding plants which a gardener can now press into service in forming his designs has, of course, enormously increased, and in those large gardens, where the decorative art is exercised on a large scale, or in some of our public parks, three groups of plants are usually employed. Alpines, herbaceous, and the large class of greenhouse bedders, including flowers and foliage plants. At Tedworth House, the park and the immediate surroundings are so particularly pleasing, that the pleasure of the scene from the windows is not specially dependent on flowers. Mr. Inglefield, however, has reason to be proud of the use he makes in dressing the lawn, of some good old standard specimen plants. In winter you will find, safely housed, a large number of Pelargoniums, ten and twelve years old; and Heliotropes, trained to suitable supports, and some of them reaching a height of 10 or 12 feet, while others are much shorter. On the appointed day, in early summer, these old favourites are grouped at points of vantage, or arranged alongside some gravel walks leading to a shrubbery and into the park beyond, in the direction of the kennels. The supports of these plants are made of wire, and by placing the taller specimens in the centre and shorter ones at their base, they can be built up, so to speak, into the form of pyramids, which, in some cases, are 7 feet across at the base. Standard Heliotropes (President Garfield and others), with

stems 3 to 4 feet long, are planted in the flower garden, in the midst of scarlet-flowered Begonias; they are tied to an upright wire, which carries a spreading top, umbrella-fashion, from which the Heliotrope trails gracefully. This sort of decoration would perhaps be more common if some of the materials were not quite so long in coming to perfection.

From the best windows of the house, one looks across the flower garden into a park that covers a large extent of land, and passes on the left up the steep sides of a long hill, which forms its picturesque boundary in that direction—a chalk ridge, well timbered at the top, and having a lofty tower among the trees, which was built by Mr. Smith in his last years, that he might still observe the running of his hounds, and watch the "Tedworth Hunt," though he could no longer follow it in the field. Salisbury lies due south, and the high road thither runs through the park, entering near the gate of the beautiful village church, which was erected at great cost within the park by the late baronet, who will be remembered as the builder of the Albert Hall, the Prince Consort Memorial, and the Alexandra Palace. At the top of the approach road, which passes between rows of Lime trees, there are several noble Elms of the common English variety, the largest measuring 20 feet in circumference at 5 feet high.

In the kitchen gardens, which, with the flower garden, employs fourteen men, there are some handsome borders of hardy herbaceous plants ornamenting the long walks of a plot of 4 acres within the walls. Besides the numerous houses and five vineries, and many others for flowers and fruits, Orchids, and various plants for decoration, I noticed 50 yards of Peaches looking exceedingly well on a wall enclosed by glass, the passage being wide enough for the storage of many plants, and for growing salads. It is due to Mr. Inglefield to mention him as the winner of 1st prize for forty-eight Chrysanthemums at the Crystal Palace.

It should be mentioned in connection with Tedworth, that the mansion stands on the site of an old manor-house, and that the older building, owned in 1661 by Mr. Mompesson, was at that time haunted by an "invisible drummer," of the same family as the one at Hurstmonceux Castle, who was immortalised in verses by Addison. He drummed here in Wilts, but in the little village immediately outside the gates, the boundary between Wilts and Hants is passed, and he would have beat his drum in the latter county. *H. E.*

NEW OR NOTEWORTHY PLANT.

ORNITHOGALUM (CARUELIA) SAUNDERSIÆ, *Baker, n. sp.**

THIS new species of Ornithogalum has just flowered at Kew for the first time. It was raised from seeds sent by Mrs. Katherine Saunders in December, 1887, in a collection of fifty-eight packets, gathered in the Transvaal, Swaziland, and Zululand. It ranks amongst the tallest species of the genus, and structurally belongs to the small sub-genus named by Parlature (as a genus) in compliment to Dr. Caruel. Its nearest ally is *O. arabicum*, L., which is widely spread in the Mediterranean region.

* *Ornithogalum (Caruelia) Saundersiæ*, Baker, n. sp.—Bulbo magno globose; foliis loratis viridibus glabris flaccidis pedalis vel sesquipedalis; scapo stricto valido tripedali, floribus subumbellatis; pedicellis longis ascendentibus; bracteis lanceolatis magnis; perianthio albidis, segmentis orbicularibus valde imbricatis; staminibus perianthio duplo brevioribus filamentis conformibus; ovario globose nitido atroviridi, stylo brevi. *J. G. Baker.*

Bulb large, white, globose. Leaves many, lorate bright green, flaccid, glabrous, 1 foot or 1½ foot in length, 2 inches broad at the middle, narrowed gradually to the base and erect. Scape stout and erect, terete, 3 feet long. Flowers many, sub-umbellate; outer pedicels 1½ to 2 inches long, erecto-patent; bracts large, lanceolate. Flower white, faintly tinged outside with green, rotate when fully expanded, 1 inch in diameter; segments orbicular, much imbricated. Stamens about half as long as the perianth; filaments uniform, lanceolate; anthers small, nearly black. Ovary shining, sessile, blackish-green; style short, cylindrical, tapering upwards. *J. G. Baker.*

ORCHID NOTES AND GLEANINGS.

CATTELEYA LABIATA, *Lindl.*

FURTHER materials come to hand to elucidate the question of the identity of the variety Warocqueana with the old autumn-flowering type, in the shape of six different flowers, from the same number of plants, from Messrs. Linden, of Brussels. They have all the characteristics of the ancient plant, and, as I said before, are not distinguishable from it. As in the case of those received last autumn from the same source, they are larger than any of the specimens of the ancient type now preserved at Kew, but this could easily be explained, and does not constitute a tangible difference. They have the same brilliant colour, they flower at the same period, and as I am now told that they came from Brazil, it only confirms the opinion I previously expressed, namely, that the variety Warocqueana is only a synonym of *C. labiata*, and therefore the newer name will have to be cancelled. There is an appreciable difference between the six flowers in the breadth of the petals and lip, in the shade of colour, and in the amount of yellow on the disc; but this is only what was observed years ago.

I may also add a note here, which I previously overlooked, respecting a second discovery of Gardner's. When at the little hamlet of Capucaya, on the banks of the Rio Parahyba, which forms the boundary of the provinces of Rio de Janeiro and Minas Geraes, on March 29, 1841, he writes:—"On the stems of the trees in the forest I met with many fine Orchideous plants, one of the most abundant, and certainly the most beautiful, being the *Cattleya labiata*." *Travels*, ed. 2, p. 410. Even here the plants were not secure, for on the previous page he writes:—"In riding along, I could not help feeling deep regret that in these regions many square leagues of such forests were being cut down or burned, in order to make room for plantations of Coffee." This has been supposed to be the June-flowering variety Warneri, but I believe it was what Gardner states, for I have now certain evidence that late examples do continue flowering in Brazil, not only into the new year, but actually into the month of March. *R. A. Rolfe.*

CATTELEYA HARRISH × (*C. GUTTATA LEOPOLDII* × *C. MENDELII*).

THIS beautiful hybrid is now in flower in Messrs. Jas. Veitch & Sons' nurseries, Chelsea. The flowers are 5 or 6 inches in diameter. The sepals and petals are pale purplish-rose, sparingly dotted with crimson. The labellum, which somewhat resembles that of a fine form of *L. elegans* Turneri, has the side lobes bluish-white, the acute apex of each lobe being bright crimson. The large and flat middle lobe is bright amethyst-purple. It is a very fine showy variety, and evidently a good grower.

THE ORCHID ROCKERY AT CHELSEA.

NEVER short of flower, a good display of rare things is to be found in the ornamental rockery-house at Messrs. Jas. Veitch & Sons, used for displaying some of the showier Orchids in bloom. Among those at present out are a large specimen of *Sobralia xantholeuca*. Some good *Cattleya aurea*, a large lot of *Vanda Kimballiana* in flower, and *V. Amesiana* in bud;

Dendrobium ciliatum, *D. phalaenopsis*, and *D. bigibbum*, *Lælia grandis tenebrosa*, and some plants of white *Lycaste Skinneri* and *Cattleya Harrisonie* are of the latter, having six spikes, with five or six flowers on most of them. Two plants of *Vanda Lowii* are blooming in an adjoining house, and a most bewildering variety of beautiful hybrid *Cypripediums*. The grand house of *Nepenthes* or Pitcher-plants too, perhaps, never looked so well and profusely furnished with pitchers.

and fifty years, as in this case. The bunches of Muscat of Alexandria, Madresfield Court, Black Hamburg, Foster's Seedling, and Lady Downes were all of extra size, while Mrs. Pearson was finer than we ever remember to have seen it before. No Grapes are grown here merely for appearance, the quality is the first consideration. For the earliest crop, Mr. Speed rightly depends upon pot Vines thus saving his permanent ones to a great extent. Figs are remarkably fine, Brown Turkey being the

by the splendid crops of fruit, and the vigour of the trees. Those in the earlier houses have already been lifted; by doing this work early, the trees make fresh fibrous roots before the leaves fall. Royal George Peaches and Pine-apple Nectarines are two favourite kinds. For late use, Princess of Wales and another Peach are most promising, with very heavy crops. Pines are looking well, with a lot of useful fruit coming on for autumn use. Melons are largely grown, the season of which is here prolonged

FIG. 58.—A VIEW OF PENRHYN CASTLE.

PENRHYN CASTLE GARDENS.

A VISIT to these well-kept gardens is always instructive from a gardener's point of view, a high standard of cultivation being aimed at by Mr. Speed. In a recent visit, we were much pleased with the appearance of things throughout, and that in spite of the unfavourable season. Both fruits and plants are well done at Penrhyn. Grapes are now in splendid condition, having more the appearance of Vines but a few years old than of those of between forty

favourite kind, fruits of the second crop being ripe, and of extra size and quality. The trees are trained very thinly, thus affording a free circulation of air, with the beneficial effects of more light. The largest tree in the Fig-house measures 70 feet or more in width, and is in the best of health. Peaches and Nectarines are largely grown under glass, more so, possibly, through their not succeeding well out-of-doors. Unless the trees are annually lifted, Mr. Speed finds that the fruit-buds drop; that his treatment is sound is abundantly borne out

by having the first crop ripe in April, the latest being carried well into the autumn. A kind called Penrhyn Seedling is largely depended upon, and well spoken of. Tomatos are extensively grown both inside and out, in both cases the crops are, and have been, very heavy; Ham Green and Ruby are the most approved kinds. Morello Cherries are an extra fine crop, a portion of which are grown upon slate walls some 7 feet in height, the fruit being large and clean. For better protection against birds, the Gooseberry quarters are enclosed in wire-

netting, an excellent system, the crop amply proving this; the Warrington is largely grown upon trellises for dessert use. Of Black Currants, Mr. Speed possesses a fine late sort now in good condition, the ordinary kinds being over some time past. To assist the dessert in the autumn, the fruits of the Granadilla (*Passiflora quadrangularis*) are found most useful, one large plant, now in profuse flower, covering the roof of a large plant-house.

Kitchen garden crops look in the best possible condition, salading evidently being an important feature. The absence of weeds in a season like the present speaks well for this department. The blight had, however, made its appearance in the Potato crop. Mushrooms are grown all the year round in commodious structures suitable for all seasons, much importance being placed upon a good supply.

Plants for decorative purposes in the Castle, and others for the supply of cut flowers, are cultivated in large numbers. A healthier lot of plants than those under Mr. Speed's charge is rarely met with. Crotons are much valued as decorative plants, one entire house being filled with an excellent stock. The narrow-leaved kinds find most favour, and are grown both as dwarf plants and from 2 to 3 feet in height, upon single stems, and as bushes. These Crotons are splendidly coloured, making a beautiful show, clearly testifying to their value from a decorative point of view. A sport, of which there are several plants, is most distinct, the tips of the narrow leaves are green, the other portions being of a deep golden colour with reddish leaf-stalks and stems. *Adiantum Pacottii*, *Caladium argyrites* (which is growing luxuriantly, is a great favourite), small plants of one of the minor forms of the fancy *Coleus*—well-coloured whilst still compact, and other dwarf-growing plants are used in quite a small state for the dinner-table in rustic baskets, a large stock being kept up for this purpose. *Dracænas* are largely grown also, *D. hybrida* finding much favour. In one house is a splendid stock of *Calanthe Veitchii* in the best of health, these are growing under the shade of *Stephanotis floribunda*, which covers the roof, being itself in profuse bloom. The tuberous *Begonias* are grown largely, making a fine display, one variety (*Davisi* lutea fl.-pl.), was quite striking because of its colour, a rich orange. The roofs in several instances are draped thinly with climbers, *Passiflora racemosa* and *Tacsonia Volkemii* being thus very attractive. In one instance the back wall of a warm-house is covered from bottom to top with *Adiantum cuneatum*, which is planted with a thin layer of soil upon the wall surface; thus a good supply for cutting is obtained. *Asparagus plumosus nanus* is being trained upon another back wall for a similar purpose. *Cbrysanthemums* are found here in large numbers, some being upon long stems for large flowers, but a greater number are bushes for the supply of flowers in quantity, all are in fine health. The earlier ones are already flowering in the open border, the yellow form of *Madame Desgranges* being one of the best. Double *Primulas* are found most valuable for cutting, the plants being of extra size and very robust. *Bouvardias* occupy a considerable space for the same purpose in pits by themselves.

Most interesting are the many comparatively tender plants which are growing out-of-doors luxuriantly, having withstood the severe frosts of the past winter. *Rhododendron Lady Alice Fitzwilliam* is in the best of health, being studded with buds for another season. This variety is planted against a south wall, and is quite at home. This plan is an excellent one for those of rather tender growth, which are at the same time of straggling habit. *Euonymus radicans variegata* covers a large space of wall, assuming quite a major form of growth as compared with the same kind when trailing on the ground. Amongst this *Euonymus* are to be seen here and there the growths of *Tropeolum speciosum* in profuse flower, producing a beautiful effect upon the light background. The double-flowering variety of the Pomegranate is thriving well, so also

is *Choisya ternata*, both being planted against a wall, the latter being a large plant; it flowers well in its season, frequently giving a smaller crop in the autumn. Upon the same wall, with various aspects, are *Aloysia citrodora*, *Ficus repens*, *Magnolia grandiflora*, and *Lapageria rosea*. The latter withstands 13° of frost with safety. In this part of the garden Mr. Speed has recently made an alteration, adding a long border for such plants as the Bamboos, all of which that are worth growing have been planted; *Eulalia japonica variegata*, *E. gracillima*, and *E. zebrina* are also doing well. Other things consist of *Lilium giganteum*, *Azalea amœna*, *Erica vulgaris alba rigida*, *Phormium* in variety, and other peat-loving plants. *Fuchsia Riccartoni* has attained huge dimensions, having reached such a height as to be capable of being trained over a wide pathway upon a wire trellis, the effect of which whilst in full flower cannot be imagined without being seen. Conifers in great variety have reached large proportions. *Wellingtonias* are in fine form, so also is *Abies Smithiana* (*Morinda*); there is also a grand plant of *Chamærops Fortunei*, which, without any protection, did not receive any injury during the severe frost.

Around the Castle there are no flower beds, thus, with the grass up to the walls, there is an air of quiet repose (see fig. 58, p. 453). Mr. Speed has done well in following out this practice. Around the outskirts of the lawn, in suitable spots, thousands of *Daffodils* in variety have been planted. Herbaceous plants, in the best-known kinds, with *Irids*, *Ranunculi*, and *Schizostylis coccinea*, are all grown for cutting purposes. A large plot is planted out with *Azalea mollis*, and specially reserved for forcing, a portion being lifted each autumn, and those previously forced planted out until again fit. These plants are of large dimensions, and must make a fine display. Mr. Speed is a gardener of sound practice, and a deep thinker; the knowledge he has gained after twenty-eight years' service at Penrhyn he is ready to impart to all who are interested in horticultural pursuits. H.

GLASS COPINGS FOR GARDEN WALLS.

In districts where Peaches and Nectarines make satisfactory growth, but do not ripen the wood sufficiently to enable it to produce strong healthy blossoms, or, where the frost frequently destroys them when they arrive at the critical stage, as a safeguard, the addition of a glass coping is well worth a trial, and the expense is trifling. The trees on the Peach and Nectarine wall at Brambletye, East Grinstead, in the garden of Donald Larnach, Esq., have produced a grand crop of fruit this year. The wall is 90 yards long and 12 feet high, and is furnished with a glass coping, 2 feet 6 inches wide, running the whole length. It is supported by wooden posts, set on pieces of stone, well raised above the ground-line. Here such varieties of Peaches as *Violette Hative*, *Grosse Mignonne*, *Noblesse*, and *Nectarines Hunt's Tawny*, *Elruge*, &c., are carrying eight to ten dozen fruits per tree. The wood appears to be ripening well, and the past summer cannot be included amongst the most favourable. The fruit on the middle of the trees, and those reaching up to the apex, beneath the glass coping, are the finest and the best coloured, and the current year's wood also seems to be favourably influenced by its proximity to the glass. No additional protection other than the glass coping was afforded the trees when in bloom, and several sharp frosts occurred at that time. During showery weather and damp nights, which are so often followed by destructive early morning frosts, the coping is of great use in keeping the blossoms dry, enabling them to withstand without injury many more degrees of frost than would be the case if the blossoms were damp.

After noting the good crops on the cordon and small pyramid Apple trees, we walked through the pleasure-grounds and around the mansion. From

the terraces magnificent views are obtainable across the valley below, and up the slopes and bills of Ashdown Forest, which is prettily wooded; in fact, the landscape surrounding the mansion on all sides could not well be surpassed in Sussex. *Visitor*, September 30.

THE CULTURE OF ALPINE PLANTS.

It has for a very long time seemed to me to be an utter impossibility to grow alpine and other plants to the best advantage on a small rockery, if it be constructed on so-called picturesque principles. I believe that the device of building a rockery *à la Mont Blanc* is not only nonsense, but almost fatal to the well-being of the subjects with which it is to be clothed. The most extreme instance of this which I have ever seen was in Battersea Park, some years ago, when a small hillock was covered at the top with *Antennaria tomentosa*, which was supposed to do duty for snow, and everything else was after the same pattern as this. But though such exhibitions may not be very commonly met with, it is true, I am sure, that alpine are often put second to the rockery on which they are grown, instead of the rockery being treated as nothing at all in comparison with them, its very form and construction being altogether subservient to their use.

Such a method as that which I have referred to above, may perhaps have its special advantage, and it is the best one to follow if a *coup d'œil* be desired. There are many splendid gardens, or ample parks, which would scarcely admit of anything else, but the price which you have to pay for it is a very large one, and the promoter must either give up the idea of growing specially difficult alpine altogether, or—and this is the only alternative which I can think of at all—the construction must cover a very large area, and, while here and there a certain number of suitable positions may be found, it is certain that very wide spaces between them will be practically lost, and little good will be got from them.

This is by no means an idea which I am singular in holding. I heard the President of the Edinburgh Botanical Alpine Club say, the other day, "We must give up either the rock plants or the rockery. It is quite impossible to do both well at the same time," by which Mr. Boyd simply meant that if we build our rockeries on purely æsthetic principles, we must in a measure, say good-bye to the flowers, while if we take them into our confidence and plainly meet their requirements, their home will, in all probability, not be very beautiful in itself. There are reasons which can be given for this, and on the strength or weakness of these reasons, any decision must turn.

A botanical friend, whose knowledge and love of plants is beyond all dispute, very lately visited my garden, and while I had expected from him a most unreserved assent (like that of Mr. Boyd), in the interest of the flowers, he could not restrain himself from lamentations over the artificiality of the plan I pursue, and he would have liked to bring boulders from Ventnor, and to give a more natural aspect to the whole thing. Of course, he may be quite right in his opinion, and was quite right in saying just what he thought, but I must have covered half an acre or more with a rockery, if the same number of suitable places for alpine plants are to be provided. I therefore think only about the well-being of my favourites, and I let other things take care of themselves. What I aim at may be called "compressed advantageousness" for alpine plants, the being able to make them contented in a comparatively small space, and then all other considerations are left out of sight. There is, however, one thing which I may as well say, by way of parenthesis, and which is not unimportant. As a rule, very artistic and picturesque rockeries cost a large sum of money. I have before my mind's eye, a construction which is said to have cost £300, and another which cost £800, and my old friend, the late Mr. Gassiot, must

have spent a very large sum over a rockery (by bringing huge rocks from Ventnor, &c.), on which he lavished the best advice he could procure, and which was beautified and adorned in the highest possible manner. But I am quite sure that in my way I can accommodate a far larger number of alpine than he could do in his way, and though I cannot speak quite positively about the following point, because I have been at work in my rockery for some four or five years, I certainly do not believe that I have expended on it much more than thirty or forty pounds for soil, labour, and stones. I must, however, acknowledge that I had a good chance with regard to the last mentioned item, and I was liberally dealt with by the authorities in Ryde.

In setting to work, I always had one thing pre-eminently in view, and I have never lost sight of it for a moment. I allude to the desirability of having a great variety of elevations and aspects, as well as of degrees of dryness, and descriptions of soil for the plants. I hold to unremitting experiment more than anything else, and if one device fails, there should be facility for turning at once to something else. In truth, before experience, it is a wonder that plants from such different latitudes and longitudes—those which grow high up on the mountain sides, and those which are sub-alpine as well, many also that have no claim to alpine honours at all—should be willing to unite in one happy assemblage, and to have a common home! and yet it assuredly is so. *Saxifraga flagellaris*, from Lapland, I believe; *Ramondia pyrenaica*, from a southern clime; *Lewisia rediviva*, from the Rocky Mountains (I think I can manage that now); *Androsace lanuginosa*, from North Indian heights; *Omphalodes Luciliae*, from the range of Mount Taurus in Asia Minor; *Morisia hypogæa*, from Sardinia; *Primula suffutescens*, from North America; *P. ciliata*, from the Western Alps of Europe; *P. Clusiana*, from the Eastern Alps; *Phytoloma comosum*, from Carpathia; *Celmisia spectabilis*, from New Zealand; *Pulmonaria dahurica*, &c., may be taken as samples of the variety of plants in my rockery, and of the widely-different regions from which they have come. Surely it is not to be supposed that they can be treated in anything like the same way, and their idiosyncrasies must be consulted, if they are to do well at all. Now, it is this very thing which I so much desire to do.

It has struck me very often that failure or success turns upon some slight and removable cause, and it is more by observation of these occasions of trouble than by anything else that one can hope to get on. My note-book is crammed full of them, and my head also. I will give just a few typical instances. I think everybody must wish to keep on good terms with *Pulmonaria dahurica*. It is a most charming little spring flower, of the brightest blue. But, unless I am mistaken, this gem is dying out everywhere. It is difficult to get hold of it now, and it bears a very bad character, indeed, for fickle inconstancy. My own experience with it has been quite of that sort; but last winter I seemed to find a clue to its requirements. I planted on my rockery, three specimens all equally good, so far as I can remember; two of them were on a lower tier of pockets than the third, this last was not far off from the others, but still a little above them, and on a very gentle incline. I believe that the difference of position made all the difference in the world to the well-being of the plants. The two lower ones died, and I never saw them at all last spring. The upper one appeared above ground at the proper time, and since has become a very strong specimen. What does this teach, but that *Pulmonaria dahurica* is very sensitive about the question of drainage, and it must never be tried on the lower level at all? This was also the case with another reputedly troublesome plant, but which cannot be called that, if it be properly used. I put *Campanula Allionii* high up on the rockery in a sandy, loamy place, and where it would get plenty of sunshine, and I also put a large patch of it where the conditions were very similar, save only that there was just a little trickling moisture to be endured. In this last situation the whole thing came

to utter grief, and it is certain to me now that *Campanula Allionii* is a lover of drought, as might almost have been supposed from its home in the Apennines.

Exactly the opposite of all this is the case with *Polygala Chamæboxus purpurea*, which should always be grown in large clumps and left alone for a time. I have found by undeniable experience that it cannot bear to be dried up, and when it has ceased to be moist, it has always ceased to do well. *Androsace eximia*, and others too, now do quite well in my hands, and the little pink blossoms abound in the spring, but this is entirely owing to their being grown in pure peat; it was far from being the case when I gave them a compost on which I relied, but which was not to their liking. They yielded up their secret through multiplied failures, and at last they were satisfied. I brought *Epilobium obcordatum* with safety through the trials of last winter, but I had inadvertently given to it a full western exposure, and as soon as the rays of the sun acquired force, it at once withered away. It was a foolish mistake on my part, and came about partly from want of room, but it will not be repeated. *Omphalodes Luciliae*, the most exquisitely tinted of all alpine plants, sickened with me in peat; it likes good fresh loam in a not very scorching position, and then it grows quickly. Perhaps the finest specimen that I have seen of this beautiful flower is in the hands of Mr. Bartholomew at Reading, but only a few paces off from it I saw a sister plant which was pining away. So exacting and inexorable in their requirements are these little beauties, that one must live among them if they are to be won over at all. Further illustrations might be given, but what has been said will suffice. If it means anything, it insists I think on the advisability of a great variety of conditions in the cultivation of alpine plants, and constant and repeated experiments reveal to us more than anything else what they like best to be treated to. A servile imitation of Nature is seldom or never possible in our hands, and when we think we have done the best in this respect, we too often find that there is something wanting after all which vitiates our proceedings altogether. With a view, then, to experimentation at every turn, I have constructed my rockery after a fashion of its own (see fig. 59, p. 439). It bears a very strong similarity in some respects to the well-known rockery in the Botanical Garden in Edinburgh, and if I had never come across that, I might not have ventured on mine; but there is a difference as well as a resemblance between the two, the main point on which they are agreed being the fact that stone pockets are more to the liking of alpine plants than anything else, and that they afford the best promise of success. The length of the whole construction is about 85 feet, and its width is about 30 feet; its height from the lowest part of the walk is 8 feet, and in shape it somewhat resembles the form of a Roman amphitheatre. All this is partly accounted for by the run of the ground, and the exigencies of a small garden, and partly because it is so made that every part of it can be very easily reached, and it is commanded by a small ladder which is kept for the purpose. There are very nearly 1500 pockets in all, and if three plants on an average be allowed for a pocket, the number may be computed at about 4500. This is exclusive of Cactuses, which do well in a sunny slope in the middle of the rockery, and which faces due south, and also of a large number of plants which grow in a wall which is from 2½ to 3 feet high, and which runs round the whole thing, and by which indeed it is held up. This wall is perforated, so to say, by the simple expedient of leaving out every alternate brick, and as it is now nearly clothed with creepers and alpine plants of one sort and another, it is as pretty an object as could well be seen in a garden, and the bricks will be soon entirely hidden. But if one thing be added to another, there is certainly a receptacle for not less than 5000 individual plants.

A perforated wall is assuredly of the greatest advantage where many alpine plants are grown. They take to it in a kindly manner, and as frost descends vertically, they can often bear to be nipped, or even cut down to the face of the wall, and in spring they

will shoot forth again as though nothing had happened. They have had a warm and cosy retreat, where no frost could reach them in winter, and where the soil—because it lies far from the surface—can be kept moist in the summer. It is, moreover, a fact that not a few very good, and some difficult plants, prefer to grow horizontally, if it can be managed, rather than in any other way, and great facilities are provided for this in a wall which is banked up with earth; the roots can penetrate far into the interior without any hindrance whatever. Some years ago, I saw clearly what protection is afforded to tender things in the chinks of an ordinary garden-wall, and of course it can be given much better in the perforated wall of my rockery. Some seeds of *Maurandya Barclayana* were blown out of my greenhouse, or carried by birds into a small crevice outside, and for several years this confessedly tender plant lived there and blossomed. It was a positive proof that an immense shelter is afforded by the kind of retreat I am speaking of, and I have tried ever since to make use of it to the uttermost. *Capparis spinosa*, *Ramondia pyrenaica*, *Edraianthus dalmaticus*, *Campanula isophylla*, and very many *Sedums* and *Saxifrages* can be grown better in this way on a wall than in any other. There is the best of homes provided by it for *Aubrietias*, *Alyssum*, *Arabis*, *Antirrhinum*, *Helianthemum*, *Statice*, *Dianthus*, *Æthionemas*, &c., to say nothing of *Ferns*, which in my hot garden can be grown in no other manner. The one which is *par excellence* the best wall plant of all, is *Campanula Portenschlagiana major*, which was kindly given to me by Mr. Wolley Dod, and which soon covers a very large surface, and hangs down in beautiful festoons. The pockets above the wall are in their way, and for quite different plants, just as useful and good. We must all cater for ourselves, and every garden has something about it which should govern all the proceedings of which it happens to be the scene. In my garden I have to fight the sun, and the glorious sunshine, which in February and March wakens up life, which gives such a depth of colour to all my flowers, is very often a great deal more brilliant in summertime than can be easily endured, and the fierce solar rays would occasion wide-spread desolation and ruin if they were not somewhat counteracted. This is the reason, or, at any rate, the main reason, why the Edinburgh pockets are so much beloved in the Isle of Wight. They afford complete protection against the scorching heat of the sun, which could not else be endured. It would be quite impossible for me to grow any *Primula* of the pubescens type without their assistance, and plants nestle into the angles which are caused by two stones. Some of my kindly critics have been rather disbelieving about this, until I explained to them what is meant. I only wish they would try for themselves, and in the hottest and most exposed position which they can find, station two exactly similar plants, and watch how they go on with and without protection being given to them. All I can say is, that before I came across the Edinburgh idea, I could never, as a rule, succeed with *Primulas* in the Isle of Wight at all. Some few, as e.g., *P. spectabilis*, were willing to stay with me for awhile, but the majority of them resented all my efforts on their behalf, and they perished accordingly. *H. E., Ryde.*

(To be continued.)

FLOWER FARMING AT MITCHAM.

ONE of the most interesting cultures still carried on in the neighbourhood of London is that of flower farming in the vicinity of Mitcham; a branch of culture, however, that is gradually diminishing as the march of bricks and mortar continues to extend the boundaries of the great metropolis. The past season, which has been so disastrous to field crops generally, has had a serious effect upon Lavender, Peppermint, and other perfume plants.

The subject of the Mitcham flower-farms has lately

been treated of in a very interesting article in the *Chemist and Druggist*. Describing the fields, the writer says:—"Most of the land was badly weeded, and in some places bare patches of soil proclaimed the ravages wrought by the winter frosts. Acre upon acre was pointed out which had been converted from Peppermint or Lavender into Potato or Cabbage land, and scarcely any new herb fields had been laid out this season. Presently we halted at a large stretch of land, whence the sweet odour of Lavender was wafted in bountiful waves. Passing through a gate, we found ourselves in a wide field, covering, may be, 50 or 60 acres. The field itself was completely treeless—no shade is wanted on herb fields—but it was sheltered in the east by a small wood, while its other sides were bounded by single rows of tall trees." It is well known that two kinds of Peppermint are cultivated at Mitcham, which are known as black and white Peppermint. These have both been described as *Mentha piperita* var. *officinalis*. As seen growing in the fields, the plants are very different from each other; the black form is a taller plant than the white, of more robust growth, has purplish stems and dark green leaves, while the white form, besides being shorter, is of a pale green throughout. "The yield of essential oil from the white is considerably less than that from the black; it is usually calculated at about three-fourths." But the largest grower of white Mint in the country estimated that the output of the white this season would be very little more than half that of the black plant. "The Peppermint plants, both black and white, are planted in long rows, and require careful weeding. The first year's crop is always a poor one, and does little more than pay the cost of production, and the farmer looks to the second and third years' crops for his remuneration. After the harvest of the third, or sometimes the fourth season, the new runners are hoed. In the month of November the old plants are ploughed in, and the new ones covered, to protect them from the frost."

Though there is such a distinct difference in the appearance of the Peppermint plants themselves, it is stated that "there are probably not half-a-dozen men living who could accurately distinguish by colour, taste, or smell the oil of the White Mint from that of the Black, but for all that, White Mitcham Mint realises a considerably higher price than Black, and is accounted the finest variety of peppermint oil extant." Besides Peppermint, Lavender and Chamomile are also cultivated to a considerable extent; both, however, suffered considerably from the severity of last winter, and the grounds this season have exhibited many ugly black patches. Many acres, indeed, both of Peppermint and Lavender grounds have this year been ploughed up and converted into Potato or Cabbage land, and scarcely any new herb fields had been laid down.

The Chamomile cultivated at Mitcham is the double-flowered form, and last year, we are informed, "That the crop was so thick, and the flower-stalks grew to such a height, that one plant touched and uplifted its neighbour, until the leaves and stalks were completely hidden, and the broad field looked as if covered with fresh snow. But this year the crop was not only late—quite half the flowers being immature—but excessively thin, and black spots of weeded earth were painfully frequent among the white and green of the plants."

The Chamomile crops in France and Belgium are also very short this year, consequently the flowers and the oil of Chamomile will realise a high price, both in the English and Continental markets. Most of the produce of the flower-farms at Mitcham finds its way to the still-house, and is distilled on the spot; but some of the Lavender is bunched and sent to Covent Garden, where, during the past season, it fetched from 3s. to 4s. per dozen bunches; but with the prospect of Lavender-oil fetching a high price, most of it was submitted to distillation. As an illustration of the price which this oil sometimes commands, it may be mentioned that in 1881 it realised as much as 8 guineas per lb., and very little could be obtained at that price. The plants which yield

essential oils require a great deal of manuring, animal manure being almost exclusively used by some growers at Mitcham, though the exhausted herb, after distillation, is also so used.

"The same stills are used, of course, for Peppermint, Lavender, and Chamomile distillation. When a charge of Mint follows one of Lavender, the worm of the still is well washed with boiling water; but if Lavender follows Mint, and especially if Chamomile has been the preceding charge, it is necessary to boil out the still with lime and water."

FRUIT NOTES.

THE STYRIAN PEAR.—In sending you some fruit last week, and asking you kindly to name them for me, I referred to the Pear Styrian, and inquired whether you could tell me how it was that so little was heard of it. It is practically never mentioned, and I do not find it in any of the catalogues. It is, however, as I said, peculiarly handsome, and a very good Pear indeed. It having ripened since I wrote you, I take the liberty of sending you two fruits, which I think will bear out what I have said, and I shall be much obliged if you can inform me why so little is heard of it. *W. H. Tillet.*

[Mr. Barron of Chiswick, to whom we sent the fruit, writes as follows. Ed.]—"The samples you have sent us of this Pear are of very fine quality, much finer than it is generally met with, although we have grown it for the last thirty years. We have always considered it a variable sort. At Keele Hall it was grown some years ago with very great success, and was in consequence put in circulation as the Keele Hall Beurré. It is an extremely handsome fruit, of medium size, long pyriform in shape."

THE WEEK'S WORK.

THE FLOWER GARDEN.

HERBACEOUS BORDERS: THEIR FORMATION AND PLANTING.—Now that the clearing of the beds of the summer flowers, and their re-filling with spring-flowering subjects are being completed, we are about to proceed with the making of two herbaceous borders, about 100 yards long and 10 feet wide, and skirting a broad gravel walk on either hand. The ground, which is under turf, like the 15 acres surrounding it, and which are thinly planted with masses and specimen flowering trees and shrubs, is planted with a row of Laburnum trees, standing 10 feet from the walk on either side. This will be taken off the spaces indicated in the ordinary way—in lengths from 24 to 36 inches, 12 inches wide, and between 1 and 2 inches deep. The soil from 18 to 24 inches deep, and consisting of a light loam resting on a substratum of gravel, will be broken up and thrown out on one side, and, being pretty close to the natural water-line, 6 to 9 inches deep of clinkers, brick-hats, &c., will be put in the bottom of each border, these being broken fine on top and then covered with the turf taken off the surface, grassy side down, to ensure good drainage. This done, the best portion of the excavated soil will be returned, mixing with it a few thin layers of short dung and leaf-mould, afterwards adding a coating 6 or 9 inches deep of red loamy soil, with which small quantities of lime, wood-ashes, soot, and horse-droppings had been incorporated, about eleven years ago, laying on another dressing of short manure and leaf-soil, and forking the whole well over to the depth of a five-tined fork, the borders being about 6 inches higher at the back than in the front when finished.

PLANTING.—In planting, all straight lines of plants of uniform height will be strictly avoided, but in a general way, the tall-growing subjects of various heights will be planted in the back rows, graduating in height from back to front, the plants forming each irregular lines varying from 6 to 15 inches in height, so as to produce a broken surface. Due regard will be paid to the planting here and there of single plants of different species known to flower in April and May, among those whose flowering-time is June and July, and so on, during the three following months; thus planted, there will be no large unoccupied spaces to mar the picture in the borders, the proportionate number of species and plants necessary to make a floral display each month during the period indicated being considered in planting. By disposing the several species and varieties in the manner described, the

large unoccupied spaces that occur in the floral picture during the spring, summer, and autumn months, where the several kinds and varieties are planted in masses, as each group of plants one after another goes out of flower, are avoided. Among the flowers which are to be planted in the rear parts of the borders, are Phlox, Delphinium, Helianthus (Sunflower), Aster, Spiræa Aruncus, Aconitum, and the like; while the body of the borders will be planted with Pæonies, Poppies, Delphiniums, Pyrethrums, Eryngiums, Potentillas, Gaillardias, Aster longifolius formosus, and A. Amellus, Gillenias, Veronicas, Erodiums, Linums, Polemoniums, Polygonatums, Aquilegias, Funkias, Fragarias, Dielytras, Doronicums, Lilliums, Francoas, &c.; using near the front, in addition to various kinds of bulbous plants, tufts of Arabis, Aster bes-sarabicus, Saxifragas, Sedum, Dianthus, Armeria, Aubrietia, Polyanthus, Gentians, &c. Among the tall-growing kinds of Michaelmas Daisies may be mentioned A. angustifolius, A. ruber, A. pulcherrimus, A. Novi-belgii grandiflora, A. Chapmanii, A. polyphyllus, and A. ericoides.

GENERAL WORK.—This will consist in dividing and re-arranging herbaceous plants in established borders and beds; the taking up and storing away in a dry place in sand of roots of Dahlias, Cannas, and such-like. Tuberous-rooted Begonias are best wintered in a cold-pit, laying the roots in soil with a good length of the tops adhering, covering the glass with a little Fern in severe weather. The making of new walks, and the re-gravelling of existing ones where necessary, will also require doing. *H. W. Ward, Longford Castle, Salisbury.*

THE KITCHEN GARDEN.

MUSHROOMS.—Beds spawned last month should be showing "buttons," and slight damping of the surface with tepid water should be afforded if it is very dry. The Mushroom-cellar or house should be kept as regards the air moderately moist, and a little fire-heat turned on at night to keep the warmth between 55° and 65°.

SALSIFY, SCORZONERA, AND CHICORY.—Of these only the finest and most shapely roots should be reserved on lifting them. A number of Chicory roots may be placed in the Mushroom-house or other dark place to bleach, following up with successions of roots to keep up with the demand. Cut off the leaves within half an inch of the crown, plant pretty close together, and keep them from the light. Parsnips are best when lifted as they are required for use, unless the soil is of a wet nature, and canker of the roots is common in those cases. Lift and store them in bins or pits in sand or fine coal-ashes. Horn Carrots sown late should remain in the ground for some time yet, that is, until they have ceased to grow.

TURNIPS, when sufficiently large, may be pulled at intervals throughout the winter, for if the weather keeps mild, they will continue to grow in size. Fully grown roots of the Turnip suffer from frost more than smaller ones, and should be pulled in time, and kept in reserve for flavouring purposes. Late sown crops of Turnips should receive surface-dressing of some kind of manure, and an occasional hoeing to aerate the soil, &c.

When the weather allows of it being done, stir the soil between growing crops. Make another planting of Cabbages; earth-up those earlier planted, affording the soil a good dressing of soot and quicklime. Late Celery, prior to being earthed up, being similarly dressed. Winter Spinach, if not making satisfactory progress, should be assisted with dressings of an artificial manure, and the plants thinned sufficiently to allow space for each to properly develop.

CELERY AND LEEKS.—These should be earthed-up in dry weather, the former for the most part finally. Too much care cannot be taken to keep the soil from falling into the hearts of the plant. The latest Celery should be examined, and every sucker pulled off, the stems tied up loosely with matting, and earthed-up when dry. Take great care to have the soil well moistened at the roots of the plants before earthing-up is begun.

GLOBE ARTICHOKE.—Cut the flower stalks down to the ground, and keep all heads fit for use in a cool shed or cellar. A heavy mulch of strawy manure should be put over the crowns, and later the stools should be protected with long litter; and in very severe weather some protection should be given to the tops—bracken being a suitable material for this purpose. *C. J. Waite, Glenhurst, Esher.*

THE HARDY FRUIT GARDEN.

PEACHES.—Late varieties of Peaches are, notwithstanding the lateness of the season, ripening much better than it was at one time thought likely they would do, but the flavour, though passable, is not good, and a really good dish of these fruits is a welcome addition to the dessert. As a late variety, Walburton's Admirable still holds its own, and the fruit is very juicy and sweet. Princess of Wales, one of the largest of the late kinds, if planted on a good aspect, and treated well, in favourable seasons it ripens well, and bears excellently. Where there are any fruits left on the trees, they should be gathered and ripened on a shelf near the glass in the vinery, where plenty of dry air freely passes among them, placing the fruits carefully on sheets of paper. Those intending to plant Peach trees this season, will find the following very useful and good varieties to select from:—Waterloo, Hales' Early, Early York, Alexandra Noblesse, Old Noblesse, Abec, Condor, Stirling Castle, Dymond, Royal George, Bellegarde, Barrington, Sea Eagle, Crimson Galande, and Walburton Admirable, with Princess of Wales for a latest use. Goshawk, Dr. Hogg, Grosse Mignonne, Royal Charlotte, and Belle Bause, are also good Peaches.

NECTARINES.—Lord Napier, Elrage, Pine-apple, Pitmaston Orange, and Humboldt, are the best; while Albert Victor and Victoria are best under glass with us, the fruits splitting on trees on the open wall.

PEARS.—For planting, the following are desirable:—Williams' Bon Chrétien, Clapp's Favourite, Madame Treve, Beurré d'Amant, Autumn Nelis, Winter Nelis, Pitmaston Duchess, Beurré Superfin, Doyenné du Comice, Marie Louise, Louise Bonne of Jersey, Glout Morceau, Olivier des Serres, and Josephine de Malines.

APPLES.—Dessert: Mr. Gladstone, Devonshire Quarrenden, Kerry Pippin, Yellow Ingestre, Worcester Pearmain, Ribston Pippin, Cox's Orange, King of the Pippins, Blenheim Orange, Margil, Cox's Pomona, and Golden Knob. Kitchen varieties: Manx Codlin, Duchess of Oldenburgh, Ecklinville, Lord Grosvenor, Lord Derby, Stirling Castle, Golden Spire, Tower of Glamis, Warner's King, Mère de Ménage, Prince Albert, Fillbasket, and Wellington.

PLUMS.—Rivers' Early Prolific, Oulin's Golden Gage, Denniston's Superb, Belgian Purple, The Sultan, Kirke's Green Gage, Victoria, Jefferson's, Prince Englebert, Coe's Golden Drop, Pond's Seedling, Washington, Guthrie's Gage, and Automne Compôte.

CHERRIES.—Rivers' Early, Governor Wood, May Duke, Kentish Bigarreau, Napoleon Bigarreau, Elton, Black Tartarian, Black Eagle, and Belle de Orleans. In the above will be found some very good things, and I feel sure will give the planter every satisfaction, though there are many others good and well worth growing.

NUTS.—These may now be gathered and stored if the husks are of a brownish colour, and the nuts beginning to drop, selecting a day when they are quite dry, place them in a dry airy room so as to prevent mouldiness and keep the nuts in the husks, and in this way they will last in good condition for several months. Sometimes the fruits are exposed to the fumes of burning sulphur, but there is no necessity for this, if the husks are dry when the crop is stored, and the storeroom be kept dry and airy. *H. Markham, Mercworth Castle, Maidstone.*

FRUITS UNDER GLASS.

STRAWBERRIES.—These plants will have made rapid progress during the last few weeks, manure made from cow or sheep's-dung having been afforded them. Space enough should be allowed, so that the foliage may get dry after being moistened by dew; and the pots frequently shifted to prevent the roots going into the bed. Plants for autumn-fruiting should now be housed and stimulated with manure-water, at the same time keeping them close to the glass. Vicomtesse Héricart du Thury is one of the best at this season, notwithstanding the fruit being small. The early plants, which are in 5-inch pots, will require the best position to get their crowns well ripened. I prefer to place them in an aspect looking south, standing them close together in a cold frame, which is done as soon as growth is at an end. Here the plants will get better ripened, and not continue growing in mild weather, as when they are plunged in coal-ashes in the open air, and being close to each other, they do not get dry at the roots quickly. The maturing of later kinds should not be

hastened by withholding water, but kept steadily moving till the time comes for them to go into their winter quarters. Dryness at the root is very bad for these plants if it be carried to excess, and become much weakened. On the other hand, exposing them to heavy rain is equally injurious towards the end of growth. Cold frames or houses afford the best kind of protection for pot-Strawberries, and if that is not practicable, the late ones may be stacked against walls or fences, or in stacks facing both ways, using plenty of ashes or fibre to prevent injury by frost and rain.

THE EARLY FIG HOUSE.—Those who may have accommodation for forcing both early and late Figs will now require to get the former pruned, washed with warm water, and dressed with an insecticide, ready for operations; but as many gardeners do not possess Figs planted out in houses, bushes in pots have to be grown instead. I need not go into pot culture and the necessary details, having treated of their preparation in earlier calendars. When plants in pots must be made use of, it is necessary to keep up a young vigorous stock of these bushes, to bring on as the older ones become too large, although, as is well known, provided the roots are well supplied with manure materials, pot-bound bushes in pots will give good supplies for many years. One such kind is Negro Largo, which actually does best when the roots are cramped for want of space. The pruning of the early house should now be finished. A good "paint" for Figs is Bentley's Soluble Paraffin Oil, or one made of sulphur, tobacco-water, and a little clay to give consistency. The walls of the Fig house should be lime-washed, and the glass and wood-work cleaned. Care must be taken not to injure the young Figs just visible on this year's wood, and a soft brush or sponge must be used for these when washing or dressing the bushes. The old mulch laying on the borders must be removed, and a dressing of turfy loam, to which bone-meal and old mortar rubble are added, afforded, making the new material very firm. Any trees which may be making too much wood may be lifted, the roots shortened, and replanted, and the soil covered with litter, to get them to start into new growth. Do not make use of any manure in the compost. Thoroughly water the border after planting, and before placing the litter on the surface. Figs in late houses will now be ripening their wood, and though these trees will continue in bearing for a long time yet, it is better for them if they are got into condition for next season's fruiting, and to do this, watering must be discontinued, abundance of air afforded, and some warmth kept in the hot-water pipes, to assist the ripening process. If these trees are crowded with shoots, a portion of the older wood may be taken out with advantage. If any tree is found to be shy in fruiting, the present is a good time to lift and replant it. *G. Wythes, Syon House, Brentford, W.*

PLANTS UNDER GLASS.

CALADIUMS.—These plants will by this time be getting past their best for the season, and should be allowed to ripen off by withholding water gradually. Place them by themselves in the driest portion of the stove, and when the foliage has died down, store them in a place where the temperature does not fall below 55° to 60°, as, if kept in a lower temperature in winter there is a risk of the corms drying.

POINSETTIAS.—Plants which have been growing in cool pits ought now to be placed in warm quarters, and in cases where a portion of the stock is required to bloom early, a few plants may be placed in the Pine-stove, where they will quickly come into bloom. A Melon-house, where the Melon plants are cleared away, is a capital place in which to grow Poinsettias until they come into bloom. Assist the plants with frequent applications of liquid manure and soot-water in a weak state if very large heads of bloom are wanted.

EUPHORBIA JACQUINIÆFLORA.—This is another plant that should be placed at the warmer end of the stove, keeping it well up to the glass, so that as much light as possible may shine on it. Care should be taken in affording this plant less water during the short days, as should the soil be kept in a constantly wet state, the plant is very liable to die suddenly.

THE STOVE.—Young plants of Allamanda struck in the spring should now be flowering abundantly. Afford the plants as much light as possible, to give strength and solidity to the blooms; and assist the plants with weak doses of some approved kind of fertiliser, so that the plants may continue in bloom for some time to come.

CLERODENDRON THOMPSONIANUM.—These plants will now require gradual drying-off, and in cases of a scarcity of house-room, the plants on balloon trellises may be removed from the trellises, and stood against the back wall, or in a corner of the stove, but care must be taken not to put them where the temperature falls below 60°, or they will soon be injured. Clerodendrons in general may be kept drier than most other plants during the time they are at rest.

CALANTHES.—The different species and varieties of this useful plant will now have completed their growth, and require less water at the roots. Place them in a light position, on a shelf, suspended some 2 feet from the roof of the stove, and here let them remain till they come into bloom. Care should be taken to keep the leaves healthy as long as possible, or the pseudobulbs will not be properly matured.

FERNS FOR FURNISHING.—The young stocks of these plants should now be exposed to full light to mature the fronds, and enable them to better withstand changes of temperature. Ferns which are used for this purpose should be grown, if possible, in low pits during the summer time, and only shading them so that the young fronds are not damaged by a too bright sun; at the same time keeping them well up to the glass. Under this régime the frond becomes sturdy and enduring. For use in a cut state it is advisable to immerse the fronds in water for several hours, as by so doing they will continue fresh for several days.

CINERARIAS.—The later stock of these plants, which at the present time is standing in small pots, which are fast filling with roots, will require a shift. Keep the plants in a low pit, where there is fire-heat at command, standing them on a bed of coal-ashes or other cool moisture-holding material; and giving air whenever the weather admits. The earliest plants will now be showing blooms, and they should be assisted weekly with weak manure-water. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

PHALÆNOPSIS.—These plants must needs engage much of the attention of the cultivator at this season, for rotting and "spot" are likely to occur, unless the warmth of the house and the moisture in the air have careful attention. The discoloration of the foliage is one of the surest signs of decay, and arises from want of air and too much moisture in the atmosphere of the house; and the first signs are brown spots on the leaves. Water must not be withheld from any plant for more than a fortnight at a time, and this only when the brown spots begin to show themselves. The plants should then be hung up close to the top ventilators, without placing them in a cool draught; and the plant being kept on the dry side for about ten or fourteen days, will effectually stay decay for some time, although, sooner or later, the affected leaves are sure to go.

Now that the plants are showing their flower-spikes, manurial assistance should be afforded at each watering, so as to ensure fine flowers; and either guano or dung-water used alternately answers well. As the spikes lengthen and begin to branch, the grower should take into consideration how many really good flowers the plant will carry, which is a matter amateurs should consider, for they are apt to err in retaining a large number of flowers upon a spike, whereas if but one-half the number were reserved the flowers would be finer, and the plant greatly benefited. Those plants which may have broken into untimely growth should have their flower-spikes cut off, else the immature growth and the flowering will soon cause the death of the plant.

THE INTERMEDIATE-HOUSE.—The dwarf growing varieties of Cattleya are now perhaps the brightest objects to be found here, a bank consisting of these Cattleyas, *Odontoglossum grande*, and *Sophronites grandiflora* is now very lovely. I would recommend those who may wish to make a point of having some good things in flower during the autumn months, to get these species, and *Vanda corulea*, which are really amateurs' pet plants, growing, as they do, under the same treatment as the *Odontoglossum*. The more I see of *Vanda Kimballiana*, the more I am struck with its beauty. I also get excellent reports from different correspondents as to its freedom to grow.

The temperatures of the different divisions should be gradually lowered at the rate of 1° or 2° a week, until a temperature of 65° at night is reached in the East Indian-house, 60° in the Cattleya-house, 55° in the intermediate, and 45° in the cool division. *A. G. Catt, Parkfield, Hallow.*

SALES FOR THE ENSUING WEEK.

(See also page 469.)

MONDAY,	Oct. 19	Great Clearance of Nursery Stock, at Cunningham's Nursery, Liverpool (four days), by Protheroe & Morris. Nursery Stock, at the Windlesham Nurseries, Bagshot, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.
TUESDAY,	Oct. 20	Collection of Established Orchids, from Old Park, Ventnor, at Protheroe & Morris' Rooms. Land, at Benfleet, by Protheroe & Morris. Dutch Bulbs, at Stevens' Rooms. 407,000 Kentia Seeds, also Bulbs and Plants, at Protheroe & Morris' Rooms.
WEDNESDAY,	Oct. 21	Nursery Stock, at Ealing, by Messrs. Protheroe & Morris. Collection of Orchids, by the late G. N. Wyatt, Esq., at Stevens' Rooms (two days).
THURSDAY,	Oct. 22	Enormous quantities of Nursery Stock, at Hollamby's Nursery, Groombridge, Tunbridge Wells, by Messrs. Protheroe & Morris (two days). Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Oct. 23	Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Oct. 24	Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°·2.

The Conifer Conference.

IN spite of the detestable weather, which prevented the presence of a large number of visitors

this was decidedly one of the most important meetings which the Royal Horticultural Society has ever held in the time-honoured gardens at Chiswick. The days on which the exhibition was held precluded us from giving any but a hurried reference in our columns last week, causing also inability to revise the proofs; but in our present issue we are enabled to revert to the subject, and to supply particulars relating to matters which occurred after our former number went to press. On Thursday it was found that considerable accessions had been made to the exhibition, including a valuable series of photographs from Mr. HANSEN, of Copenhagen, together with lists showing the number of Conifers that can be grown in Denmark, and with statistics relating to their growth in that northern climate. Mrs. ROBB also sent an interesting series of drawings by a Chinese artist, representing trees introduced by FORTUNE, and which were made at the instance of Miss BOULTER, now Mrs. ROBB. The Chinese artist, it appears, wisely stipulated that he should be permitted to add figures of his countrymen, which, while they add greatly to the quaintness and vitality of the illustrations, furnish valuable indications as to size. The drawings, though destitute of perspective as we understand it, were nevertheless quite recognisable, and were further valuable as giving the Chinese names of the trees in question.

Further details as to the exhibit of living specimens in the Conifer garden, which formed one of the most striking features of the exhibition, are given in another column. On the third day of the Conference the meeting was presided over by the Director of the Royal Gardens at Kew, who alluded to the magnificent specimens grown in Scotland, of which so many illustrations were exhibited. The papers read included one by Mr. MALCOLM DUNN, to whose efforts the success of the exhibition was so largely due. Mr. DUNN's experience on Lord POWERS-COURT'S estate in Ireland, and subsequently at Dalkeith in Scotland, gave a special importance to his opinions, which were ably summarised in his paper. In the course of his

remarks, he alluded to the growth of various Conifers in Scotland, and to their value for decorative or economic purposes. From the latter point of view, he alluded specially to Prince Albert's spruce *Tsuga Mertensiana*, the *Abies Albertiana* of gardens, *Abies concolor*, the Douglas Fir (which he characterised as the most valuable introduction since the Larch), *Picea Menziesii*, *A. grandis*, *magnifica*, *Nordmanniana*, *Cupressus Lawsoniana*, *C. macrocarpa* (which he considered one of the best trees for the afforesting of Ireland), *C. Nutkaensis*, *Pinus laricio*, *P. monticola*, and *Thuja gigantea*. In the second rank he placed *Araucaria imbricata*, which succeeds in the most storm-beaten parts of the West of Scotland; *Pinus austriaca*, *P. excelsa*, *P. strobus*, and others. In alluding to species principally of use for decorative purposes, Mr. DUNN adverted to the care requisite in the selection of memorial trees, where a mistake was not readily rectified. The publication of Mr. DUNN's paper in full will be anxiously awaited.

Professor MARSHALL WARD, as the representative of our first forest school, gave an admirable address on the diseases to which Conifers are subject. This address was a model of perspicuity, begotten of full knowledge of the subject. Dealing really with a very technical and complicated subject, Professor WARD managed to put before his hearers, in the clearest manner, an admirable survey of the subject. How so learned a scientist managed to give his hearers so clear a summary, with so little use of technical terms, was a matter of surprise. The word "mycelium" in place of spore was almost the only technical term we noticed, as, with great skill, Mr. WARD managed to convey a lucid notion of the extremely interesting phenomena of "heterocicism," which are as important to the cultivator as to the man of science, but which, owing to the technicalities ordinarily made use of, make the subject more or less of a sealed book to the very persons most specially interested from a practical point of view. Professor WARD alluded first of all to the diseases consequent upon a want of balance and proportion between root-action and leaf-action, and to the climatal and other causes which bring about such a want of proportion.

Passing then to the consideration of diseases due to the action of fungi, Professor WARD alluded first to those of the better-known fungi, commonly classed as Toadstools and Mushrooms, which attack trees; then to the rust fungi, which affect the leaves in the first instance, and then to the ascomycetous mould. Special attention was given to the "wound fungi," and to those which gain an entrance through cracks in the bark, or injuries inflicted by frost, insects, animals, and man. He showed how, out of the countless millions of spores produced, there was ample opportunity for the introduction of the germs of the fungi, which, germinating under appropriate conditions, penetrate the wood, absorb the nourishment contained in it, and interfere with the healthy action of the tree.

The rust fungi are particularly remarkable in that they pass one part of their life on one plant, and work out another portion of their life-history on some other plant of a totally different nature; the fungus itself in the two conditions being so utterly different as to have led to the application of different names, and to the classification of the forms in different groups. Thus a particular fungus growing on the common Groundsel or one on a *Vaccinium* has a totally different aspect when living on a Silver Fir. Practical men will remember with complacency

that this relation between apparently different organisms was long ago found out by the farmers, who branded the Berbery bushes as enemies to the Wheat. They were ridiculed at the time for this, but experience has shown that they were right as to their facts, although widely in error as to their interpretation of them. It is not the Berbery bushes that do the mischief, but a fungus which grows upon them. But who, without the minute study that the scientists have made, could believe that the rust of Wheat and the cluster cups of the Berbery have any real connection, or be indeed specifically identical, or that a fungus on the Juniper could affect the Hawthorn, or one on the Groundsel prove prejudicial to the Firs, producing a growth of entirely different character according to the plant on which it grows? And yet, thanks to DE BARY and others, in Germany, and to PLOWRIGHT, particularly, in this country, the fact has been proved to demonstration by the process of inoculating the tree with spores of the fungus from the other plant and *vice versa*. Fortunately vegetable physiologists are not hampered by the misguided anti-vivisectionists, and so the truth can be more readily arrived at. Considering, on the one hand, the injuries to which plants are subject from insects, squirrels, frost, wind, friction of branches, or mischievous boys, and considering, on the other hand, the enormously great production of fungus spores, the wonder is, not that trees are attacked, but that disease is not far more prevalent than it is.

With reference to the Larch, Professor WARD considered that the prevalence of the disease in some districts of this country, as contrasted with its relative infrequency in its native Alps, is really due in great measure to the fact that we in this country, all unwittingly, put the Larch under conditions more favourable to the growth of the fungus than to that of the tree. It was disquieting, too, to learn that the Douglas Fir, to which we are looking as one substitute for the Larch in certain situations, has its enemy in the shape of a mould or *Botrytis*, which may be as fatal as the *Peziza* on the Larch.

Other papers which, being of a purely technical character, were "taken as read," and others, of which the authors were not present, were passed over at the meeting, but will form part of the report in the Society's *Journal*. This report, not only from the value of the papers to which we have alluded, but on account of the statistics as to rate of growth and other matters, should be one of the most valuable contributions to arboricultural knowledge ever issued.

Reverting to the cut specimens, which were sent in such prodigious numbers, we may add that they were gone over after the conference as carefully as their numbers would permit, and their nomenclature revised. We have already alluded to the extraordinary specimens sent from the Earl of ABERDEEN'S estate at Haddo, but we mention them again to allude to the marvellous vigour and rapidity of growth of *A. amabilis* (shown as *grandis*), of *A. magnifica* (shown as *amabilis*), of *A. nobilis* (shown as *balsamea*), of *Abies Lowiana*, *A. firma*, *A. bracteata*, and of others, which were simply marvellous to southern eyes. *Picea pungens glauca* and *argentea* (Parryana of gardens), and *Abies concolor violacea* are among the most brilliantly coloured and hardiest of Conifers. *Thuja gigantea* (Lobbi) justifies our anticipations as to its future. *Abies firma*, from Munches, showed the finest growth of its kind that we have ever seen, and this species was shown from Balmoral (we think), with cones, the first that have been seen on home-grown trees. The cones of *Pinus Ayacahuite*, from Weston Birt, shown by Messrs.

JEFFRIES of Cirencester, were also very remarkable. In several collections cones of *Athrotaxis selaginoides* were shown as *A. Gunneana*, *Picea pungens* was in one case labelled *Annesleyana*, and more commonly named *P. Engelmanni*, a much inferior species. Endless confusion also seems to exist between *Picea Alcockiana* and *ajanensis*. *Thuia gigantea* was shown under half-a-dozen names. *Pinus Thunbergii* and *P. densiflora* were almost universally sent as *P. Massoniana*. *P. Gerardiana*, so-called, was usually nothing but *Pinaster*. But these circumstances are just what might have been expected, the only source of regret being, that when so much

factors, but tells a tale also of diminished rentals and contracted outlay.

As to new forms we saw but few, save minor varieties of the Lawson cypress, and some *Retinosporas*; for *Abies Eichleri*, a supposed new species, turns out to be *A. Veitchii*.

Now that Ireland has to be afforested, and thousands of acres elsewhere now unremunerative, await development, it is to be hoped that more attention will be paid to the subject, and that this last really superb effort on the part of the Royal Horticultural Society will result in the future in a greatly increased attention being paid to the subject of planting,

CHRYSANTHEMUMS IN THE LONDON PARKS.—The Chrysanthemums in Finsbury and Southwark Parks are, as the Superintendents inform us, getting in good condition for inspection. The display in Finsbury Park was opened to the public at 10 o'clock on Saturday, October 10; and that at Southwark opens to-day, October 17, at the same hour. The shows will remain open for two or three weeks. The show of Chrysanthemums in the Frame Yard, at Battersea Park, was opened to the public on Friday last.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.—A Council meeting of this society was held at the office, 189, Great Brunswick St., on Monday, Oct. 5.

FIG. 59.—A PORTION OF REV. H. EWBANK'S ROCK GARDEN. (SEE P. 454.)

time and trouble have been expended in rectifying matters, so few people seem to care to adopt a revised version. Another thing strikes us as noteworthy, and that is the little way which the more newly-introduced kinds, such as some of the Japanese species, *e.g.*, *Abies firma*, *A. sachalinensis*, *brachyphylla*, *Picea ajanensis*, etc. have made. Many of these trees, introduced within the last quarter of a century, are, so far as we can yet see, every bit as important, whether for decorative or useful purposes, as the introductions of DOUGLAS at an earlier period. This cannot be attributed wholly to taste and fashion, though these are very potent

and that thus the apathy of the unappreciative London public, and the disastrous impediments offered by the weather, may in the end be compensated for by a vast increase in the productive resources of the country, and in the amenity of our plantations and pleasure-grounds.

THE JAMAICA INTERNATIONAL EXHIBITION.—We learn from Messrs. CARTER & Co., seedsmen, of High Holborn, London, that they have been awarded the highest prize (a Gold Medal) for their exhibit of English tested seeds, packed for the tropics. Another exhibit consisted of living examples of some of the finest species of annual flowering plants, many of which had been grown on their seed farms in Essex.

The following members of council were present:—Mr. HENRY CUSACK (in the chair), Mr. J. GARNETT RATHBORNE, J.P.; Mr. C. STRONG KING, J.P.; and Mr. HAMILTON DRUMMOND, Hon. Sec. The judges were appointed, and other arrangements made for the Chrysanthemum Show, which will be held on November 5 and 6.

GRIFFINIA HYACINTHINA.—A quantity of plants in flower, of this charming blue and white-flowered bulbous plant in Mr. WM. BULL'S nursery, Chelsea, exhibits the good qualities of this species. It is as easy to grow, and requires the same kind of treatment as *Eucharis amsonica*, but thrives with rather less warmth. The plants with their stout stems bearing umbels of bright porcelain-blue and

white flowers, each about 2 inches across, and firm in texture, form attractive objects, especially at this season.

STREPTOCARPUS HYBRIDS AT CHELSEA.—At the Royal Exotic Nursery, Chelsea, Messrs. JAS. VERRICH & SONS, have brought these neat and pretty greenhouse plants to great perfection, and are growing them largely for seeds. The plants bear their pretty Gloxinia-like flowers in great abundance in autumn and winter; and among the more conspicuous of the new strain we recently noted one which was pure white, except a small and almost invisible lilac line in the tube. Passing from this are pure white, with one median and four or six side lines in the throat; white with the interior of the tube furnished with radiating mauve-coloured lines, forming a perfect star on the expanding segments; white, with rose lines, and white with purple lines, and the same series of markings in the flowers having rose, blue, or lilac ground colour. Another very fine strain has mauve flowers with a white throat and purple lines in the tube, and the whole of the varieties have the same dwarf habit and fresh-looking foliage.

LIME AS A PRESERVATIVE FOR POTATOS AND FRUIT.—Mons. MONCLAR has been trying the use of lime as a preservative for Potatos and fruit. He at first tried it with Potatos in order to prevent them from rotting, thinking that a little skin-corrosion would be preferable to the complete loss of the stored crop; but he found that the skin was quite unaffected, and he was enabled to keep Potatos fourteen months after they had been harvested without deterioration. He found, however, on keeping a sample four months' crop, that decay began to set in, being accompanied by a degeneration of the starchy matters into sugar. Encouraged by this success, Mons. MONCLAR has more recently applied lime to the preservation of Apples and Grapes when stored, and the results were quite as good. The lime in the case of Apples and round fruits generally, can be easily removed by means of a wet rag; but it would be advisable to wrap valuable fruits first in tissue-paper. The preservative qualities of dry lime are found probably in its caustic properties, which are certainly germicidal, and perhaps its hygroscopic properties are in some way concerned.

THE BEST MANURE FOR TOMATOS.—An Italian chemist, N. PASSERINI, has lately been investigating the composition of the stems, leaves, and fruit of Tomatos (*Solanum lycopersicum*). He made a number of analyses of the ripe and unripe fruit, and his experiments have been conducted during the past four seasons. One would expect, therefore, that he would be in a position to deduce some important generalisations from his work. Having regard to the large amount of potash in the fruit, and the considerable quantity of lime in the stems and leaves, he considers that the following manuring may be recommended for Tomatos:—Farmyard manure, 5000 kilogrammes; calcium superphosphate (18 per cent.), 30 kilogrammes; potassium chloride (50 per cent.), 60 kilogrammes. This quantity of manure is that recommended for distribution on 1 hectare of ground planted with Tomatos. Another Italian chemist, namely, T. GIULI, has also been investigating the composition of Tomatos, but he does not propose any particular manure.

STOCK-TAKING: SEPTEMBER.—The Board of Trade Returns for the month of September show a decrease in the importations, as compared with the same period last year, amounting to the sum of £1,362,387—almost the only items showing an increase being articles of food, &c. Some consolation for this state of things may, however, be found in the fact that the imports for the nine months of the year passed away exceed by £5,253,043 those for the corresponding period in 1890. What with sinister rumours from this and that foreign capital, and the aggravation of strikes at home, no wonder that capital shows a certain amount of timidity, and

thus a deficiency of imports to report. The following figures are from the "summary" of the imports from foreign countries and British colonies for the past month:—

	1890.	1891.	Difference.
	£.	£.	
Total value for month	£25,551,688	£24,189,301	-1,362,387
§II.—(A.) Articles of food and drink—duty free	12,448,671	12,671,013	+222,342
(B.)—do., dutiable	2,570,681	2,967,724	+397,043
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	4,063,419	3,340,072	-723,347
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,676,544	4,029,509	-647,035
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,261,940	1,196,565	-65,375
(B.)—Parcel Post ...	41,460	29,931	-11,529

In the matter of seed-growing, we have some interesting accounts from the United States. It appears that whereas some fifty years ago seed farms were to be found only in Connecticut and New York States, they are now to be found all over the vast country, as far as the Pacific Coast. The wonderful development of the railway system there has had much to do with this, for the managers of lines in America cater for public support in a way quite unknown here; and for years fruit trains have been run from end to end of the States—from California and Florida up to New York. The Western and Southern men are coming more and more to the front every day, and one feels no surprise at the fact that, having taken stock of things, they are turning their serious attention to the abolition of the McKinley Tariff and President HARRISON. If certain "City" rumours are to be taken notice of, we are threatened with a species of import deserving the consideration of some working-men at home. It is stated that several capitalists engaged in the building trade are taking the preliminary steps towards the erection of wood-working establishments in Belgium, so as to render themselves less liable to interference from "Unions." The matter is certainly worthy of note here. The following figures are extracted from the general returns for September:—

	1890.	1891.	Difference
§ II. Fruit:—			
Apples, raw bush.	393,020	197,478	-195,542
Unenumerated, raw	1081,256	786,184	-295,072
Onions	516,682	195,083	-321,599
Potatos cwt.	45,144	49,825	+4,681
Vegetables, raw, unenumerated value	£76,273	90,204	+13,931

These statistics lose none of their significance as the months pass on. Here it may be worth while to notice a statement that vegetable products are reaching the English market from the sister isle. We failed to find any grounds for such a statement, and application at the Irish Department elicited the information that no intelligence of such a movement had reached the officials there. A word or two as to the exports of British and Irish manufactures: there is a falling off in the month of £1,971,134 as compared with September, 1890; the falling off for the nine months is given as £9,984,191, a somewhat serious difference, but there have been worse accounts than this, and there are three months of the year still to run.

CHAMBRE SYNDICALE DES HORTICULTEURS BELGES ET SOCIÉTÉ ROYALE D'AGRICULTURE ET DE BOTANIQUE, GHENT.—On the occasion of the meeting of the above Societies on Sunday, October 4, in the Casino, the following awards were made by the judges.

Certificates of Merit.—To *Catsetum seaccatum*,

shown by M. A. Van Imschoot; to *Pteris serrulata plumosa*, shown by MM. Duriez frères; to *Cattleya aurea* and *Zygopetalum rostratum*, shown by M. A. Van Imschoot; to *Dracæna Professeur De Bosschere*, shown by M. L. Desmet-Duiver; to *Cattleya Dowiana*, shown by MM. Edm. Vervæet et Cie.; to *Vriisia Lubbersi*, shown by M. Léon Poelman-Maenhout; to *Pandanus discolor*, shown by Mr. Ed. Pynaert Van Geert; to *Cactus Dablia* with striped flowers (new), shown by M. Schmitz.

Certificates for Good Culture and Bloom.—To *Miltonia candida*, shown by M. A. Van Imschoot; to *Pteris Victoriae*, shown by MM. Duriez frères; to *Vanda cœrulea*, shown by Madame la Marquise de Wavrin; to *Cypripedium Roebelini* (unanimously), shown by M. A. Van Imschoot; to *Oncidium Lanceanum*, shown by MM. Edm. Vervæet et Cie.; to *Lotus peliorhynchus*, shown by M. A. Van Geert; to *Salvia Soucheii*, *S. splendens*, and *S. Issanchou*, shown by Madame la Comtesse Douairière de Kerchove de Denterghem.

SHEFFIELD BOTANICAL GARDENS.—Mr. WILLIAM HARROW, from the Cambridge Botanic Garden, has been appointed curator of the Sheffield Botanical Gardens in the place of Mr. ATEINSON, who recently resigned.

MARRIAGE OF MR. L. G. SUTTON.—The marriage of Mr. Leonard Goodhart Sutton, youngest son of Mr. Martin Hope Sutton, and partner in the firm of Sutton & Sons, with Miss Mary Charlotte Annie Seaton, daughter of Colonel Seaton, Madras Staff Corps, of Salween, Beckenham, Kent, was solemnised at Christ Church, Beckenham, on Wednesday, September 30.

WEDDING.—At the parish church, Gillingham, Norfolk, on the 5th inst., ANNIE, the only daughter of Mr. J. BATTERS, was married to Mr. J. HOLMES. Mr. BATTERS was for many years the Head Gardener at Gillingham Hall, Norfolk, and previously for a long period as Head Gardener to J. B. W. FLEMING, Esq., and after with Mrs. WILLIS FLEMING at Chilworth Manor, near Romsey, and well known at one time as an exhibitor of Pine-apples and early vegetables at the meetings of the Royal Horticultural Society.

TO THE PHILANTHROPIC: CAUTION.—A certain individual, calling himself FRANK HENDERSON, and stating that he was a nephew of the late Mr. PETER HENDERSON, of New York, has lately visited one of our leading seed firms, pleading deficiency of resources. Enquiry was made by cable from New York, and the reply came that the gentleman in question was unknown to Messrs. PETER HENDERSON & Co.; and that a similar young man, probably the same, paid Messrs. HENDERSON a call in New York, representing himself as a Mr. SUTTON, a relative of Messrs. SUTTON, of Reading.

A NEW MARKET AT BRENTFORD.—At a special meeting of the Brentford Local Board, on Tuesday evening, the Markets Committee recommended the purchase from Lord ROTHSCHILD of 2a. 2r. 30p. of land, at Kew Bridge, adjoining the North London Railway Station, for the sum of £3350 7s. 9d., for the purpose of the construction of a fruit and vegetable market. The recommendation was adopted unanimously, and it was agreed to obtain the consent of the ratepayers at a public meeting, according to the 116th section of the Public Health Act, 1875. The plans for the new structure have already been prepared by the surveyor, Mr. J. H. STRACHAN, and approved. The frontage will be 150 feet in length, and the façade will contain five shops opening on to the Chiswick High Road, each having a frontage of 16 feet. Behind each, a covered erection will run, and round the whole will be an open court. There will be a pair of gates at each end, one for ingress, and the other for egress. The North London and South Western Junction Railway joins the land to be acquired.

HOME CORRESPONDENCE.

SUBJECTS OF STUDY FOR GARDENERS.—Like "W. L.," at page 432, I have often lamented that no short and simple course of reading and study has been laid down for young gardeners who wish to excel in their profession. But there are two sides to every question, and I am proud to know many young gardeners who do systematically practise drawing and reading, in order to improve themselves. One, in particular I have now in my mind's eye, who has a set of Professor Huxley's Science Primers, as published by Macmillan & Co., including Sir J. D.

vegetable physiology, &c., is a useful book, to be had second-hand for a few shillings; so also Loudon's *Self Instruction for Young Gardeners*, and Lindley's *Theory and Practice of Horticulture*. Every gardener should learn enough of freehand and mechanical drawing to enable him to express clearly and decidedly what he means as to the form or design. A good rough sketch, the work of a moment or two only, is often of more practical value than a long and wordy description. It is not necessary that a gardener should emulate the artist, but he should learn to sketch clearly and quickly the main point of things as he sees them. Botany, geology, and natural

young English gardener whom he had recently engaged. The gentleman had had many troubles with former gardeners, and when we came to the Orchids, the employer said to me in German, "I truly hope this new man will not ruin my plants by neglect, as the others have done." "I trust not," I replied. "No, sir," said the gardener, also in German, your plants shall always have from me the best attention." Tableau! We all looked at each other, and a laugh was unavoidable. The moral is—employers must be careful of the young gardener of the future. Accomplishments, such as music or languages, or of photography (a very useful one indeed), &c., are all very well in their place; but the one thing a gardener must learn is, how to grow the finest of garden produce, the best of vegetables and fruits, and of flowers. Especially must he study the soil and capabilities of the garden in his charge for the time being, and the best varieties suited to his soil and locality. This is a kind of knowledge dependent on his acuteness of observation and on clear reasoning powers, and is but rarely to be learned from books. Nearly every garden, even closely-adjointing ones, vary in some marked particulars—a particular crop grown in a particular way will succeed in one part and fail in another part of the same garden. The soil, manures, climate, aspect, prevailing winds, elevation, all demand and must ever obtain constant attention from the gardener who would be most successful. There are some people who deride "book-men," or "writing-men," as they are called, and who tell you that "a pound of practice is worth a ton of theory," &c., forgetting that the best results of practice and science, as combined, are better than the best results of either practice or theory alone! The best practical gardener the world ever saw would have been still a better gardener and a better and happier man if he had known the "reason why" of his cultural successes, and could have clearly explained them. Those who deride the "book-man" or the "writing-gardener" should blush when they read names like Paxton and Lindley, Abercrombie, McIntosh, and the Thomsons, or of Gilbert, of Wildsmith, or of Hudson and Douglas, of Spyers, or of O'Brien! The one great modern want amongst gardeners to-day is amalgamation and co-operation, lacking which no body of professional or craftsmen can ever hope for, or to their best. Is not this a chance for the Royal Horticultural Society of England? F. W. Burbidge, F.L.S.

The very interesting note by "W. L.," in last week's *Gardeners' Chronicle*, p. 432, on subjects of study for gardeners, deserves to be read by all young gardeners. I can with confidence say, that if botany were more studied by gardeners they would never regret it, for in conjunction with practical gardening, it would prove to be a source of great interest. A gardener may know how to grow and treat a plant to perfection, and some gardeners will say that is quite sufficient, but a little knowledge as to its structure and functions should never be passed on one side; therefore, I suggest the desirability of a knowledge of botany to gardeners. I agree with "W. L.'s" suggestion, that if a series of articles were published by the various horticultural papers dealing with the forms and functions of plants, it would enlighten the gardening community greatly. M. E. Mills, *Coombe House, Croydon*.

The note by "W. L." (p. 432), in your last issue, is worth more than passing notice, as it opens up a wide field for discussion as to the subjects young gardeners should take up; and I may here remark that I fear the horticultural press would be unable to do what "W. L." desires, as many readers would object to have its columns taken up in the way described [it has been done repeatedly], and older gardeners would not give the matter the attention it deserves, and editors cannot now find room for lengthy articles. A good system to adopt in populous districts is to form a class, and get young men to attend once or twice a week, and thus gain a certain amount of botanical knowledge, besides other subjects of use to them in their profession. I note with pleasure that this is being done at Ealing at the present time, the instructor being a specialist, the whole series of winter lessons being obtainable for a trifling payment; and it is worthy of note that when young men have to pay for their teaching, they are more diligent in attendance and more industrious than when it is provided for them gratuitously. It may also be added that mutual improvement societies which meet during the winter months are doing much good, and enlarge the mind when

FIG. 60.—*ABIES NORDMANNIANA*: TO SHOW HABIT.

Hooker's *Botany*; Jevon's *Logic and Political Economy*; *Geology and Physical Geography* by Geikie; Roscoe's *Chemistry*; *Physiology*, by Dr. M. Foster; *Physics*, by Professor Stewart; and the "Introductory" volume of the series by Professor Huxley himself. Baker's *Botanical Geography*, Allcock's *Botanical Names for English Readers*, *Treasury of Botany*, and Johnston's *Gardeners' Dictionary* are other works every young gardener should strive to possess for reference purposes. Logic and English composition should gain attention from all gardeners, for, other things being equal, the better and clearer they can think, the better, the easier, and the more efficiently they can work. The latest edition of Lindley's *School Botany*, with its list of axioms in

history generally would bring much pleasure into the leisure of all gardeners, young or old. I know a celebrated gardener who has a large family of clever boys, and there is not a beast or fish, or a bird, or a butterfly, in the district, that he and his family do not know, not only by name, but they know their life histories as well. It is always a pleasure to visit them and hear of a new insect, a curious egg, or of a spider they have discovered in their locality for the first time. In towns, there are often opportunities for gardeners to utilise their evenings at free libraries, or they may attend classes for drawing, photography, short-hand, or for French or German languages. *Appropos* of these, the other day I walked round a good garden with its owner and an intelligent

the young men, who attend them, enter into the discussions heartily, and the papers chosen are instructive, and not too long. In the country, evening classes are difficult to arrange, a teacher of botany being often not easily got; but I have seen much good accomplished by enlisting the services of the schoolmaster, the young men studying their various subjects under his guidance. In large places there are often sufficient men to form a class. I know where there have been classes for many years, the employer kindly paying for the attendance of a good teacher twice a week, and the men are permitted to take up any subject that they may choose. Some are very attentive, whilst others think that it is derogatory to study! On the whole, the advantages of these classes to them in after years is, I fear, of little value, and as I said before, if the studies are to be of any value in after life, the men must have the wish to improve their minds, and when they do so by their own exertions I find they appreciate it more, and are more anxious to get on; but I notice a want of interest in scientific studies in general. A. Y. Z.

"HARDY PERENNIALS."—For the benefit of gardeners generally, will you kindly define (1), what is a "hardy perennial"? I have been an exhibitor for nearly thirty years, and thought I knew; but I found at Chiswick last week that I did not, but I am always willing to learn. I should also like to know (2), under what head you would place *Lilium pardalinum* and *Colchicum variegatum*, if not of hardy perennials?—and (3), whether the ordinary garden hybrids of *Pentstemon* are considered hardy? These questions are asked from a horticultural and not a botanical point of view, and the question of herbaceous perennials is not in any way raised. W. Marshall. [(1) Our correspondent is assuredly about the best person to frame the definition he wants, we shall not attempt it, because the interpretation to be given to the term "hardy perennial," as used in flower-show schedules, is a matter of convention or custom, whereupon judges differ. As referees, we should decide in favour of prevalent garden custom. It is not the general custom to include bulbous plants and cormose plants in garden catalogues and schedules, under the head of hardy perennials, but to place them apart under bulbs. Suppose an order to be sent to a nurseryman for a dozen hardy perennials, would our correspondent expect to get a bulb or a cormose plant among them? Or, to take a converse case: suppose a class for twelve bulbous or cormose plants, would not the judges be right in disqualifying if the group contained an *Aster* or *Pyrethrum*, a *Holly* or an *Oak*? We think they would, and as referees, we should support them. All are hardy perennials, but we should as little expect to see a bulbous plant among "hardy perennials" as a *Pyrethrum* among bulbous plants. (2) Under bulbs—strictly speaking the *Colchicum* is not a perennial at all, the new growth is the successor to that of the previous season, not the same. (3) We do not consider hybrid *Pentstemons* hardy under all circumstances, although they are described in books of reference, e.g., *Nicholson's Dictionary*, and also in nurserymen's catalogues, as "hardy herbaceous perennials," or as hardy plants. Ed.]

ASTERS "COLLECTED WILD."—On p. 435, I observe a suggestion that some *Asters* exhibited by me at Chiswick, which were labelled "collected wild," were "probably garden escapes." This is a mistake; the *Asters* in question were collected in the province of Alberta, near the base of the Rocky Mountains, and were not named by me, because I was assured that they could not be matched in the Kew Herbarium. C. Wolley Dod, Edge Hall, Malpas.

AN EFFICIENT, SAFE, AND CHEAP INSECTICIDE.—To 2 oz. of soft-soap, add a wineglass and a half of water, and stir till it is properly mixed, when it will have the appearance of dough; to this add the same quantity of petroleum oil, which will cause the mixture to curdle at first, but it must again be stirred, till it takes on its former appearance, then when water is added, the petroleum oil will be found to be quite soluble. For mealy-bug, if put on with the syringe, 1½ gal. of water may be added to the mixture; for dipping plants 2 gals.; for American blight on fruit or other trees, 1½ gal., which may be used at any time during the year, providing dull days during summer are chosen for the work, and the trees are syringed with clean water before they get dry. For thrips, red-spider, green or black-fly, 3 to 4 gallons of water should be added, and the same for the washing down of plant-houses in the winter. For mildew, add 4 gallons of water; and for the winter dressing of Vines and Peaches, use at the same strength as for mealy-

bug. After its use, all dirt may be easily removed from the plants by syringing them with clean water, and they will have a healthy appearance, which will be retained for a long time afterwards. In the case of very tender foliage plants, it is best to syringe with clean water soon after its application. I do not recommend this mixture for *Orchids*, although I have no doubt some of them would stand it very well. John Dinwoodie, The Gardens, Highfield, Gainsborough.

DELPHINIUM ALBUM GRANDIFLORUM.—Lovers of the *Delphinium* are strongly advised to make a note of this truly estimable variety, the white-flowered *Delphinium*. It has now been under my observation for two seasons—and I like it much, as being a break to the preponderating array of blue-coloured flowers. It is pure white, grows about 3 feet high. It does not seem to require any special soil, position, &c., growing well in ordinary garden loam. I find that last season it was introduced to a number of English gardens, so we shall doubtless hear more of it anon. Hybridists will no doubt see in the variety a valuable aid towards yet securing new colours. Pioneer.

HYACINTHUS CANDICANS.—I removed a number of these plants two years ago, and when planting them, burnt earth was mixed with the staple. The bulbs were put about 4 inches deep in the soil. They flowered the first season, but not so well as this year, when they threw up flower-spikes of 5 feet 10 inches high, with thirty-six blooms. I have this year a large circular-shaped bed planted with *Hyacinthus* in the centre, and intermixed over the remainder with *Lobelia cardinalis*, which looks admirable. But to see the plant at its best, it should, I think, be planted with the *Gladiolus Brechtlevisensis*. I remember to have seen *Hyacinthus candicans* planted on the herbaceous border at Holker Hall, North Lancashire, which for a number of years flowered well, the plants not having the least protection in winter. C. E. Martin. The Hoe, Wilwyn.

BELGIUM.

INTERNATIONAL EXHIBITION AT ANTWERP.

In the section devoted to vegetable products, some of the exhibits, which were specially connected with botany and horticulture, deserve particular mention. There was a most interesting and noteworthy collection of fruit, vegetables, and roots, for fodder or industrial uses, modelled in wood, and painted, from Messrs. Vilmorin-Andrieux et Cie., of Paris. These capital reproductions, copied from Nature, were admired by all for their accuracy; each specimen was exactly the weight of the fruit or vegetable which it represented; and it may fairly be said that the "Grand Prix" won by this well-known French firm was well earned.

M. Ch. L. Van Nerom, of Brussels, showed cards of statistics relating to Belgian agriculture, &c.; an album also containing agricultural statistics of the country, and maps of botanical geography, explaining the botanical researches instituted by the Royal Botanical Society. The utility of such work is too evident to need comment; the jury awarded two Gold Medals to the painstaking exhibitor.

The *Études sur les principes actifs des Plantes (Alcaloïdes et Glucosides)*, consisting of three large volumes, gained for their author, M. E. Dupny, of Brussels, a Diploma of Honour. The work is of very considerable scientific value.

M. G. De Jetter, Assistant Secretary to the Royal Linnean Society of Brussels, showed a glass case, containing Belgian economic and medicinal buds, herbs, and flowers; they were carefully labelled, and dried by a process from which most satisfactory results were obtained—a Gold Medal was awarded. The collection of forest and grass seed, from M. Keller, fils, of Darmstadt, was most noteworthy, and won a Gold Medal.

A new remedy for cryptogamic diseases of Oranges, Lemons, Vines, Potatos, Tomatos, Beetroots; and for insect pests—greenfly, caterpillars, &c., the "poudre sulfosteatite," from M. Jean Souheur, of Antwerp, gained a Silver Medal—well deserved, because of the good results which have followed the

trials of this substance. Further experiments will no doubt be made. The Institut Supérieur de Commerce of Antwerp exhibited, in a very intelligible form, specimens of the principal food, economic, and medicinal products, obtained from leguminous plants. Such specimens, illustrating the properties of the chief botanical families, should be found in all the more important public museums. The Antwerp Botanic Garden, in which many improvements have lately been made, showed a collection of Servian woods, of timber, a collection of woods and dyes, and a set of models of flowers for use in teaching botany. The Commercial and Industrial Museum of Antwerp showed a series of specimens chosen from their collections of woods, Coffee, Cocos, Sugar, Cotton, Indigo, Maize, Wheat, Rice, &c.

The Royal Lionean Society and the Royal Floral Society of Brussels, have arranged that an exhibition of fruit and plants be opened on October 11. It is expected to achieve considerable success.

The *Chrysanthemum* shows will this year be even more numerous than ever. The principal will be those organised by the Société Royale d'Agriculture et de Botanique at the Ghent Casino, and by the Société Royale d'Horticulture of Antwerp.

There has been formed at Ledeburg, Ghent, a society composed of the workmen in the various horticultural establishments, with a view to assisting the members when precluded from work by illness. During the great Exhibition at Ledeburg, a concert was given in the hall for the benefit of this fund, and for the same object bouquets sent in by various nurserymen were sold by young ladies. The entrance-fee was 20 centimes (2d.), and the sum finally obtained for the benefit fund amounted to 1030 francs (about £43). Ch. de B.

KEW NOTES.

HIBISCUS CALYCINUS, Willd.—This is the correct name of the plant known in gardens as *H. chrysanthus*. It was distributed by Mr. Bull in 1884, who described it in his catalogue of new plants for that year as "a free-growing shrubby plant introduced from Natal. It has hairy stems, and roundish sub-trilobate leaves. The flowers are of large size, campanulate, with broad obovate petals, yellow, with a purple-crimson spot at the base, forming a dark-coloured eye." A plant of it was obtained for Kew from M. Lemoine & Son, of Nancy, and this is now in flower. A peculiar character in this species is that of the epicalyx or involucre, which is formed of five broadly spatulate, cuspidate, bristle-pointed leaflets as long as the calyx. The flowers are 4 inches across, saucer-shaped, bright sulphur-yellow with a maroon-crimson blotch; the stamens are orange-yellow, and the stigma purple.

FUCHSIA.—A list of the species and varieties of *Fuchsia* in cultivation at Kew may interest those of our continental friends, who are now paying special attention to this genus. In England the garden hybrids and crosses among *Fuchsias* are much more in favour than the true species, although some of these are very ornamental when well managed. Altogether, there are about fifty species known, and of these thirty-one are cultivated at Kew. Their names are:—*Fuchsia alpestris*, *F. arborescens*, *F. a. var. syringifolia*, *F. boliviana*, *F. coccinea*, *F. conica*, *P. corallina*, *F. cordifolia*, *F. c. var. alba*, *F. cylindracea*, *F. decussata*, *F. discolor*, *F. Dominiana*, *F. excortica*, *F. exoniensis*, *F. fulgens*, *F. globosa*, *F. Hartwegii*, *F. gracilis*, *F. g. var. variegata*, *F. maorostema*, *F. microphylla*, *F. Mieliezii*, *F. procumbens*, *F. pumila*, *F. radicans*, *F. Riccartonii*, *F. serratiflora*, *F. simplicifolia*, *F. integrifolia*, *F. splendens*, *F. triphylla*, *F. thymifolia*.

SCOTLAND.

THE DUTHIE PARK, ABERDEEN.

It is always a source of pleasure to visit this park, as it is evident the superintendent, Mr. Harper, spares no trouble in maintaining it in excellent keeping, and developing its resources to the fullest extent, whether it be in removing that which tends

to obstruct the view either from natural growth, or through the development of other features in the park, it is seen to before it obtrudes itself on the visitor. It is the due attention to such details that gives so much pleasure to the landscape gardener, and of course to the public generally. On a recent visit we were much pleased to find things in "apple-pie order," and that new features were being developed, such as clearing the undergrowth in the plantations down to the eye level in certain places; thus admitting pleasing glimpses of the park from other points, and notably so from the railway trains on the Deeside route to Balmoral.

A great feature of this park is the way the encircling shrubberies are brightened up with flowering plants, and for this purpose many of the showier annuals are used with excellent results. Long marginal masses of the pink *Saponaria calabrica*, *Linaria purpurea reticulata aurea*, the white *Matricaria inodora plenissima*, *Godetias* of sorts, one named *Lady Satin Rose* was very good; various *Clarkias*, Sweet

fruitful orchards, there are other parts which were once famed for Apples and Pears; but now, so far as fruit-growing industries are concerned, may be termed *Ichabod*—so much orchard culture previously has been practised in low and flat districts. The planters in the carse of Stirling and Falkirk have been peculiarly fascinated by such positions, that large tracts of land (in ages past) were planted with Apple and Pear trees. It is singular how well many kinds do in these parts, when ordinary attention is given them. Orchard culture must have been well understood during the last century, as the remains of the plantations indicate. Semicircular elevations were formed, and the trees planted in straight lines on the top of them.

I have noticed that when removing the remains of these old orchards, that the bottom roots were in a state of decay, while those on the surface were in perfect health. The lesson we learn from this is, to make provision at planting-time to prevent downward growth of roots, as when they penetrate the soil

Modes of preparing the ground were first touched upon by Mr. Fairgreive, draining where necessary being regarded as of prime importance, and trenching where practicable being in every case desirable. Enriching the soil by manure or composts was also regarded as necessary when it was naturally poor. Special soils are not considered so necessary now as formerly, but peat and sand were always beneficial to *Rhododendrons* and other allied kinds, particularly in heavy soils. Pruning was an important operation, but was apt to be carried too far. One-third only of the shoots should be cut back annually; this was sufficient to keep the plants in proper balance and good form, while the flowering would be abundant, without excess, and the quality of the flowers would be improved. In planting, it was contended that the distance apart should be such as would be ample for the fullest development of each kind of shrub, so that the individual character of each should be exhibited to the best advantage. Considerable discussion followed the reading of the paper, on the debatable points raised by the author.

Numerous exhibits were on the table. From Messrs. Laird & Son's were several seedling *Dracaenas*; one named *Duchess of Portland*, a variety of elegant habit, with leaves of moderate breadth and bright colouring, and another seedling unnamed, with arching, narrow, incurved leaves, brightly coloured, were certificated; as was also a new variety of *Asparagus plumosa* named *cristata*, reared by the same firm—the peculiarity of the variety was, that the leaves were distinctly crested at the tips. Mr. John Downie tabled a fine group of tuberous *Begonias* in flower, several of which were certificated.

From Messrs. Dicksons & Co. came samples of two new Apples, one of which, a dessert variety named *James Grieve*, received a Certificate for excellence of quality and handsome appearance. Messrs. T. Methven & Sons exhibited a bright scarlet seedling *Carnation* named *Lady Lansdowne*, and a pretty autumn-blooming deeply-laced pink, named *The Gem*. Messrs. Jas. Dickson & Sons, Edinburgh, exhibited a bloom of *Chrysanthemum*, from a plant reared from seed sown in February. The bloom was 6 inches in diameter, and of good form. Mrs. Lyall, North Berwick, sent flowers of *Cricium Moorei*; Dr. Paterson, Bridge of Allan, sent blooms of *Magnolia grandiflora*, alleged to be the Exmouth variety, which rarely flowers in that locality. Mr. Murray, The Gardens, Parkhall, Polmont, tabled samples of a large handsome *Tomato*, of the *Hackwood Park* type; each of the fruit weighed about 15 ounces.

A collection of seedling Plums was tabled by Mr. Webster, The Gardens, Gordon Castle. They were not all ripe, and consequently, were unfit for being adjudicated upon by the committee, which, however, considered them a very promising lot, of which more will probably be heard another season.

CRYPTOGAMIC SOCIETY OF SCOTLAND.

The seventeenth annual Conference of this Society was held at Paisley on the 22nd, 23rd, and 24th ult., under the presidency of Mr. John Polson, in accordance with the wishes of members who desired to have a public exhibition of Cryptogamic plants. Paisley is famed all the world over for its various manufactures. It is not so well known for its attainments in natural science; but no one who has had an opportunity of visiting its fine museum can doubt that there are many ardent students of Nature among its people. In ornithology the museum is particularly rich, the collection of birds which it contains being one of the finest in the kingdom. The recent exhibition of cryptogamic plants was taken up with enthusiasm, and proved a great success.

The members of the Society mustered on Monday, the 21st, at the close of a day of storm throughout Scotland, and of doubtful forecasts for the morrow. The morning of Tuesday, the 22nd, however, ushered in a day of calm and of sunshine, exceptional in the

FIG. 61.—*ABIES NOBILIS*, AND *CUPRESSUS ERECTA VIRIDIS*: TO SHOW HABIT.

Alyssum, *Hymenoxys californicus*, *Cornflowers*, *Chrysanthemums*, *Pyrethrums*, *Phloxes*, *Pentstemons*, *Dahlias*, *Gladiolus*, *Nasturtiums*, and *Violas*, of which about 40,000 plants are used annually. *Nemophilas*, *Nigellas*, and a host of similar things put a lot of life and colour into the picture. Carpet bedding, although rather limited, is well done, and with the public, at least, this sort of thing seems to be popular, as we noticed several carriages which were driving in the park, pull up when opposite those beds, and inspect them for some little time.

Notwithstanding the past severe winter, *Eucalyptus Gunnii* passed safely through, but *E. globulus* succumbed. There are many other features worth noting in this park, but by far the best thing to do is, when in the vicinity, to go and see them, and if possible secure the guidance of the genial superintendent, Mr. Harper. F. R.

SCOTTISH ORCHARDS.

Though the carse of Gowrie may retain much of its historical interest as a district abounding in

below the beds of adjacent rivers, they begin to perish. While removing forest trees, the same decaying of roots is found.

By the decay of the old orchards, I fear many of the varieties of Apples and Pears, which were valued for their hardiness and abundant bearing, are lost. The cause of misfortune to orchard culture is allowing them to run wild, becoming too thick, and when the roots have searched and found all the food they can reach, they are left to perish in soil which has become inert. This is very common, too, in the great fruit districts in the west of England, where a wide acreage may be often seen going fast to ruin, and, except for cider-making, most of the fruit is worthless.

SCOTTISH HORTICULTURAL ASSOCIATION.

This Association held its ordinary monthly meeting at 5, St. Andrew Square, Edinburgh, on the 6th inst., Mr. Wm. Welsh, President, in the chair. Mr. Fairgreive, the Gardens, Dunkeld, read a paper on "Shrubs, their Cultivation and Arrangement,"

rainy west. The party was completed at the pier of Gourrock, where the members had the pleasure of welcoming Dr. Plowright and Mr. Ward from King's Lynn. Taking steamer to Kinn on the Holy Loch, a halt was made to allow our English friends, who had travelled overnight, to breakfast. The grounds of Hafton were soon reached, and the day was spent in roaming the woods. According to tradition, a vessel laden with earth from Palestine was sunk in the waters of the Holy Loch—hence the name. Its scenery is of exquisite beauty. The shores are dotted with picturesque villages and private residences. The rising slopes are richly wooded, the greenery gradually mingling with the purple of the Heather, which, in its turn, shades indefinitely into the ethereal colouring of the grand mountains in the background. No wonder that it is eagerly sought after as a summer retreat from the smoke and din and turmoil of city life. After a brief visit, and a hearty welcome from the proprietor, at Inver-Eck, particularly interesting to botanists from its having been the residence of the late Sir William Jackson Hooker, the party returned by the entrance to Loch Long to Gourrock, and again stepped into the pro-saic railway-carriage for Paisley. The excursion was a most enjoyable one, and will long live in the memories of those who joined in it.

The business meeting of the Society was held in the evening. After the transaction of ordinary business, the President delivered the annual address, in which he welcomed the Society to Paisley. The address was characterised throughout with great reverence of spirit, and could not fail to awaken interest in the study which it is the aim of the Society to promote. In a paper by Mr. A. Stephen Wilson, of Aberdeen, on "The Germinal Origin of Vegetable Parasites," special reference was made to *Peronospora infestans*. This gave rise to an interesting discussion, in which Dr. Plowright maintained the position which is familiar to mycologists from his researches in this department of botanical investigation. Mr. William Stewart, Glasgow, contributed a catalogue of the Agarics of the Clyde district, containing 178 species. Dr. Plowright then gave an account of a visit which he had paid to Dr. Robert Fries at Gothenburg, and relating some interesting anecdotes of his father, the immortal Elias Fries. His visit has been fruitful in clearing up difficulties about various species, of which he submitted coloured figures for examination. After the usual votes of thanks, the meeting closed.

Wednesday, the 23rd, was devoted to the public exhibition, and at the annual dinner in the evening the members had a pleasant reunion.

On Thursday, the 24th, a short excursion was made to Johnstone Castle, the seat of Mr. G. L. Houston, who, after kindly receiving the members, and showing them some antiquities of interest, which he had discovered in renovating portions of the old tower, conducted them through the woods of his extensive park.

The chief interest of the meeting for many was centred in the public exhibition. The members of the society were early astir on the day of its opening, and hampers, which had poured in from all quarters, soon revealed their treasures. These were laid out on tables in the lecture hall of the museum, and formed a grand collection. Tables were specially devoted to classified and named species of fungi. The result was a more complete representation of the various genera than has hitherto been obtained in similar exhibitions. Nearly 200 species were named and classified. No new species were discovered, and no very rare ones were gathered.

Tables were, as usual, devoted to collections of edible and poisonous species. The hall in which the fungi were exhibited was tastefully decorated with a profusion of potted Ferns and greenhouse plants.

In other halls of the Museum there were arranged fine collections of Ferns, mosses, and seaweeds from the herbaria of local enthusiasts. These, though attracting less general attention than the strange forms and colours of the living fungi, were of great value and of deep interest to specialists in the science. As a whole, the exhibition of Cryptogams

was one of the finest which has yet been made in connection with the meetings of the Society; and it must be matter of lasting satisfaction to the naturalists of Paisley, that their efforts to provide an exhibition so full of educative influence have been crowned with success. Our space will not admit of reference to the names of the many who have contributed to this success; but we cannot omit mention of the Vice-President of the Society, Mr. James Clark; of the Secretary of the local committee, Mr. John A. Rennison; and of the Curator of the Museum, Mr. Morris Young, to whose united and unwearied efforts so much of the success of the Conference was due. To all others who have interested themselves in the meeting, and laboured for its success, our gratitude is equally sincere.

The Society will hold its next annual Conference at Aberfoyle, in the county of "Rob-Roy," under the Presidency of Colonel Stirling, of Gargunnoch. *J. S., Glamis.*

SOCIETIES.

ROYAL HORTICULTURAL.

THE EXHIBITION OF CONIFERS.

One of the chief features of this exhibition, to which we alluded briefly last week, and which attracted a more than ordinary share of attention, was the neatly-arranged collections of Conifers sent for exhibition by many of our prominent nursery firms. A more fitting place could not have been selected for arranging these exhibits. The centre portion of the ground, a plan of which we gave last week, was occupied by three large oval-shaped beds, surrounded by a border which varied in width, and in these were artistically arranged some of the rarest and most beautiful of Conifers. From the Combe Wood Nursery, Messrs. J. Veitch & Son sent a representative and healthy collection of hardy Conifers, including amongst other rare kinds, the beautiful Umbrella Pine of Japan (*Sciadopitys verticillata*), with shoots and cones of the most healthy hue imaginable; the curious but elegant *Retinospora filifera gracilis*, *Cupressus Nutkanensis aurea*—a good thing in its way; *C. Lawsoniana filiformis*, one of the most ornamental varieties of the favourite Cypress that has yet been offered to the public; although not much behind it is the rarely-seen *C. Lawsoniana pedunculata*.

Amongst the *Picea* and *Abies* genera, some of the most noticeable and interesting were the little known *P. ajanensis*, with leaves silvery beneath; the pretty and desirable *Abies Veitchii*, *Tsuga Sieboldi nana*, dwarf and interesting; *Picea Omorika*, the newly-discovered Servian Spruce; the true *Abies lasiocarpa*, better known as *Abies subalpina*; and the noteworthy *A. firma* and *A. amabilis*.

Retinospora plumosa albo-picta pleased us much, it being one of the neatest and brightest Conifer gems that could well be imagined, and it is to be hoped that it will receive that attention that as a hardy ornamental dwarf-growing Conifer its merits justly entitle it to. The neat habit and pretty foliage tint of *Cupressus arizonica* should do much to place it in the front rank of ornamental Conifers, *Pinus parviflora*, so prolific in cones, and *Retinospora squarrosa*, each about 7 feet high, showed off to good advantage near the centre of the bed, while the healthy hue of *Torreya Myristica*—a plant that does well in Ireland—showed that it can be grown in the climate of England, a fact also proved by the fine fruiting specimens shown from Orton Longueville by Mr. Harding. Of the Japanese Cedar (*Cryptomeria japonica*) there was a curious form called *spiralis*, and which, were it not for the appearance here and there of normal-shaped leaves, would have been worthy of a more exalted place than it received. *Pinus Ayacahuite* is an uncommon species, but one that is worthy of a bold attempt to get established amongst any collection of Conifers; fine cones of this species were exhibited from Weston Birt. The newly-discovered *Tsuga caroliniana* has much to attract notice. The weeping form of the Canadian Hemlock Spruce, *T. canadensis pendula*, is well worthy of extensive cultivation as an ornamental tree, it being particularly graceful and beautiful of foliage colouring.

Equally good with the Combe Wood collection was that sent from Knap Hill by Mr. A. Waterer; indeed, both collections looked so healthy, and were composed of such rare or beautiful individual spec-

imens, that it was a matter of no little difficulty to say which was the finer. Conspicuous amongst the Knap Hill plants was *A. Lowiana*, a well-grown healthy plant fully 7 feet high; the curious *Retinospora leptoclada*, the golden Canadian Juniper (*Juniperus canadensis aurea*), a pretty and most effective Conifer; *Retinospora lycopodioides*, and *Picea pungens glauca*, one of the hardiest and most beautiful silvery Conifers.

Curious, and of value for rock gardening, is the dwarf *Abies nigra nana*, a plant so remarkable from its dark Yew-coloured foliage. The glaucous Atlantic Cedar (*Cedrus atlantica glauca*) will ere long be a common tree, for it is questionable if any other is so beautiful in foliage tint. In *Picea excelsa Remonti* we have a very distinct form of the Norway Spruce, and one that will be of value in ornamental grounds.

From the famous Elvaston collection Messrs. Barron & Son sent a well-selected and very interesting group of unusually well-grown healthy plants, and as great care in arrangement had been taken, the whole collection looked one of the best. In it we particularly noticed the rare *Taxus baccata* William Barron, certainly a distinct and desirable variety of our common Yew. *Pinus Coulteri* and *P. Koraiensis* were worthy of examination, more healthy specimens being rarely seen in this country. *Picea Schrenkiana*, *P. polita*, and *P. excelsa Remonti* are rarely-seen kinds that were here exhibited in good form, and in the best of health. One of the best variegated Conifers is *Cupressus Lawsoniana pyramidalis albo-spica*, and in which the irregular patchy blotching that we are too much used to was quite wanting, a quiet but effective tint pervading the whole specimen.

Messrs. John Jefferies, of Cirencester, showed some beautiful specimens of *Cupressus Lawsoniana elegans*—a first-class ornamental tree, and one that should be largely used in parks and lawns. *Abies concolor violacea* seems to be coming well to the front—at least, if we might judge by its presence in most of the collections. It is a most distinct and effective tree. Of *Abies Lowiana* (commonly, but erroneously, called *A. lasiocarpa*), there were several good specimens in this collection, and it is a species that cannot be too widely known. The cut specimens from Haddo, Aberdeenshire, were marvellous for vigour and rapidity of growth. In *Tsuga Hookeriana* we have another desirable and pretty-foliaged species, that is as yet far too little known.

Messrs. Paul & Sons exhibited a most interesting and largely representative collection, and the individual plants were well grown and full of foliage. The rarely seen *Juniperus Berkleyi*, *Pseudo-Larix, Kämpferi* (the Golden Larch), *Taxus Livistonii*, and *T. Barronii* were exhibited in well-grown specimens, and seemed to attract a more than ordinary share of attention. *Juniperus recurva densa* is worthy of a place, and is certainly distinct from the typical species, although we can hardly say that it is either equal or preferable to it. The Umbrella Pine (*Sciadopitys verticillata*), was here again well shown in fine healthy glaucous-foliaged specimens—but, indeed, this was noticeable in all the groups. Westman's form of the Lawson's Cypress is a drooping variety, of very elegant growth, and would be an effective specimen if well placed in any collection. Other interesting exhibits of Messrs. Paul's were *Abies bracteata*, *A. numidica*, and *Tsuga Pattonii*, the pretty *Cupressus pendula compacta*, *Juniperus neoborensis*, and the distinct and interesting *Juniperus fragrans*—a rare shrubby species.

One of the large beds was most artistically planted by Dicksons of Chester, with unusually well-grown and generally speaking rare and effective specimens, the whole being surrounded by neatly-grown plants of the golden Lawson's Cypress. Conspicuous in it we noticed the little-seen *Podocarpus Koraiensis*, the upright form of *Cephalotaxus pedunculata*, and the Umbrella Pine (*Sciadopitys verticillata*), a healthy fine-looking specimen, and which clearly pointed out that the air of Cheshire suits well the wants of this interesting Conifer.

Of *Abies Lowiana*, perhaps the finest specimen in the collection was that of Messrs. Dicksons, while their variety of *Cupressus macrocarpa* must soon come to the front as a first-class ornamental variety. *Picea accicularis*, a form of *P. Alcockiana*, reminded us much of a very fine-foliaged *Picea Morinda*, but there was something distinct in it which is not readily described. The Chester collection comprised also well-shaped trees, a wealth of healthy foliage, and a generally pleasing look.

From Hammersmith, Messrs. Charles Lee & Son sent some uncommon kinds of Coniferae. We admired much the new *Cupressus Nutkaensis aurea* and the equally uncommon *Taxus sempervirens albospica*, both of which are worthy of a note by intending planters of choice Conifer subjects. The Weeping Wellingtonia (*Sequoia gigantea pendula*) is, as shown, more curious than beautiful. The specimen was about 14 feet high, ugly, and uncouth.

Rather a large collection was that of Messrs. W. Cutbush & Son, and which included a fine specimen of *Cupressus Lawsoniana erecta-viridis*, a neat habited and decidedly distinct variety that is to be recommended. Of the pretty and well-known *Retinospora plumosa aurea*, several unusually large and neatly-shaped specimens were included in this collection.

Perhaps one of the neatest and most taking collections was that of Messrs. Paul & Sons, Cheshunt, and which included only such Conifers as are suitable for rock gardening. In it were such dwarf specimens as *Picea Remonti*, *Cephalotaxus pendunculata* var. *fastigiata*, *P. excelsa* Maxwellii, *P. excelsa* nana, *Cryptomeria japonica compacta*, *Abies Pinsapo* (Parker Hammond's var.), *Thuopsis latevirens*, *Juniperus virginiana compacta*, *Picea orientalis pygmaea*, *Thuia occidentalis recurva*—a rare form; *Cupressus Lawsoniana minima glauca*—a neat and pretty rock Conifer, and *Picea excelsa deliciosa* and *A. excelsa Doumetti*, both forms of our common Spruce. This list is of great value as showing at a glance the best kinds of Conifers for rock gardening.

Side by side with this was a most interesting collection from the Royal Gardens, Kew, chiefly of such Conifers as require a greenhouse temperature—at least, very few could survive, even in the most favoured parts of Great Britain or Ireland. Here we saw *Libocedrus Doniana* (this is hardy in Ireland), *Athrotaxis cupressoides*, *Juniperus bermudiana*, *Phyllocladus asplenifolia* (a very pretty Conifer), *Libocedrus Gunniana*, *Dacrydium Franklinii* (hardy in two places, at least), *Microcachrys tetragona*, from Tasmania, with long pendulous foliage, and of unusually neat growth.

Scientific Committee.

TUESDAY, October 6.—Present: Dr. M. T. Masters, in the chair; and Messrs. Morris, McLachlan, Blandford, C. W. Dod, and G. Henslow, Hon. Sec.

Strawberries attacked by Beetles.—With reference to this subject, brought before the Committee at the last meeting, Mr. Blandford observed that the fact had been recorded before, and attributed to identically the same insects, so that it was very probably the same beetle in the present instance. The fact that the carnivorous beetles thus changed their habit to eat Strawberries reminded Mr. Dod of the interesting fact that squirrels would eat not only Mushrooms but even poisonous fungi.

Primula rosea, mildew.—Mr. Dod exhibited plants, and observed that this species alone had been much attacked this year, and especially during the wet season after great thunderstorms in the last week of June. The specimens were sent to Dr. Cooke for further examination. Mr. Dod also added, that he had tried many kinds of remedies for mildew this season, but with no very great success, the best being "anti-blight" and watering with sulphate of copper. *Iris reticulata* had been very badly attacked this year.

Fog Report.—Mr. Morris read a communication from Mr. H. Rix, stating that Mr. G. H. Bailey, Secretary of the Town Gardening Committee of the Manchester Field Naturalists, had expressed the willingness of the committee to work in conjunction with the Scientific Committee of the Royal Horticultural Society in the matter of "Air and Fog," and had applied for the grant of £50 placed at the disposal of the joint committees by the Government Grant Committee.

The members of the Scientific Committee were unanimous in agreeing to the proposal of Mr. Bailey, as there was still a working balance from last year's grant to go on with.

Polyporus fraxineus.—Dr. Plowright forwarded a specimen, with the following observations:—"It was taken from an Ash tree near King's Lynn, which is being killed by this fungus. The tree is still alive, and bears a certain number of leaves, but will evidently succumb before many months. The fungus has attacked the base of the trunk near the ground, which is the usual site of its attack. *P. fraxineus* has hitherto not been generally regarded as a parasite by mycologists in Britain, but it clearly is a true parasite, capable of doing great damage to the trees it attacks. It is not one of the most common species with us. When once a tree is fairly attacked, it is soon killed by

the fungus." The question was raised whether the fungus be not rather a parasite in consequence of the previous unhealthiness of the tree, as is so often the case with other fungi, as Dr. Masters observed. Mr. Henslow added that *Polyporus squamosus* grows on a dying Horse-Chestnut tree in his garden, but not on the healthy ones, from which it might be inferred that when that fungus occurs on Ash trees, as is so often the case, the probability was that the trees were unhealthy.

Merulius lacrymans.—Dr. Plowright also sent fine specimens of this fungus, the "dry rot," remarkable for the development of well-formed pilei. Such are seldom seen; they are flat, orange coloured, and spreading over the cushion-like mass of the fungus.

Apple Canker.—Dr. Plowright also forwarded specimens of this condition, but as is usual in the advanced stage, it is impossible to assign a cause; probably some ancient irritation having been set up, the organism having long since disappeared, the abnormal growth continued.

CRYSTAL PALACE FRUIT SHOW.

OCTOBER 8, 9, 10.—English-grown Apples and Pears were seen very extensively displayed at the Crystal Palace on the above date, and there was a pardonable feeling of native pride in surveying such superb examples of home cultivation. It may be said it was all the result of high cultivation, which is undoubtedly true; still it showed what the soil is capable of producing, and perchance, some day, some horticultural Moses may arise to teach the people that by means of improved cultivation of varieties that are certain croppers, growers may be led into the promised land of commercial success. The competition was keen in almost every class, and rich colouring, for so untoward a season, was everywhere observable.

Apples.—The best exhibition of one hundred dishes came from Messrs. G. Bunyard & Co., Old Nurseries, Maidstone; indeed Kent-grown fruit was to the fore through the entire show; Mr. C. G. Sclater, Devon Nurseries, Heavitree, Exeter, was 2nd, with some remarkably good fruit also, generally finely coloured; 3rd, Mr. J. Watkins, Pomona Farm, Withington, Hereford, with a fine lot also, many brilliantly coloured, and included varieties not often seen on the exhibition table.

In the amateur's class for fifty dishes, Mr. G. Woodward, gr. to R. Leigh, Esq., Barham Court, Maidstone, was 1st, with a splendid collection; 2nd, Mr. Geo. Goldsmith, gr. to Sir E. Loder, Bart., Leonardslee, Horsham; 3rd, Mr. A. Waterman, gr. to H. L. C. Brassey, Esq., Preston Hall, Aylesford, Kent, who was likewise 1st with twenty-four dishes; 2nd, Mr. Geo. Reynolds, gr. to the Messrs. de Rothschild, Gunnersbury Park, Acton, with excellent examples; 3rd, Mr. T. W. Startup, West Farleigh, Maidstone.

The best twelve dishes came from Mr. F. Bridger, The Gardens, Penshurst Place, Kent; 2nd, Mr. S. H. Goodwin, Smarckwell, Mereworth, Kent.

Pears.—The best collection, not to exceed fifty dishes, orchard-house fruit excluded, came from Mr. G. Goldsmith, gr. to Sir E. Loder, Bart., Leonardslee, Horsham, who had superb fruit of *Beurré d'Anjou*, *Beurré d'Amanlis*, *Conseiller de la Cour*, *General Todleben*, *Bon Chrétien*, *Beurré Rance*, *Beurré Alexander*, *Lucas*, *Beurré Hardy*, *Louise Bonne* of Jersey (very fine), *Nouveau Poiteau*, *Marie Louise de Noville*, *Triomphe de Spencer*, &c.; 2nd, Mr. Geo. Woodward, Barham Court, also with remarkably good fruit; Messrs. Geo. Bunyard & Co. were 3rd; and Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, 4th, with very good collections.

In the amateurs' class for twenty-four dishes, Mr. G. Woodward was 1st, his fruit here, as in all the classes in which he exhibited, being nicely set up on red leaves of the Virginian Creeper; 2nd, Mr. A. Waterman, Preston Hall, who staged fine examples; 3rd, Mr. T. H. Crisp, Canford Manor Gardens, Wimborne, with twelve dishes. Mr. G. Goldsmith was 1st with some superb fruit; 2nd, Mr. R. Smith, gr. to Lady F. Fletcher, Kennard, Yalding, Kent, with good fruit.

Apples and Pears of Orchard-house Growth.—But one collection of these was staged—from Messrs. G. Bunyard & Co., and it comprised about fifty dishes of superb fruit.

Messrs. G. Bunyard & Co. offered special prizes for the three best-flavoured Apples in three varieties, and prizes for three dishes of Pears also. There were a considerable number of entries. The 1st prize for dessert Apples went to Mr. Will Taylor,

nurseryman, Hampton, who had Ribston Pippin, King of Pippins, and Cox's Orange Pippin from pyramid trees grown on the paradise. The best-flavoured Pears came from Mr. W. A. Cook, Compton Basset, Cañe, who had Brockworth Park and Fondante d'Automne from south-east walls; and Madame Treyve, from pyramid.

Vegetables.—The open class for the best collection of vegetables, arranged for effect, brought some huge ones, laid out in squares, having the appearance of shallow wooden trays. Wonderful types of vegetables were staged, and scarcely any grown in the kitchen garden appear absent. Mr. C. J. Waite, gr. to Colonel the Hon. W. P. Talbot, Glenhurst, Esher, was 1st, with a remarkably extensive lot, very fine quality characterising all; 2nd, Mr. A. Palmer, Thames Ditton House, Kingston on Thames, arranged his productions much more effectively, but he lacked Mr. Waite's variety, and general fine quality. Mr. W. Salmon, Elder Road, West Norwood, was 3rd; this exhibitor is said to be a postman, but he is a very able gardener also.

The best twelve dishes came from Mr. Thomas Wilkins, gr. to Lady Theodora Guest, Inwood House, Henstridge, Blandford, who had very fine specimens; 2nd Mr. W. Pope, The Gardens, Highclere Castle, Newbury, with very fine produce also; Mr. J. Friend, gr. to the Hon. P. C. Glyn, Rooksnest, Godstone, was 3rd.

Messrs. James Carter & Co., seed merchants, High Holborn, offered special prizes for six dishes grown from their seeds, and here Mr. T. Wilkins was again 1st with a very fine lot, Mr. C. J. Waite 2nd, and Mr. W. Pope 3rd.

Potatoes.—Messrs. Sutton & Sons, seed merchants, Reading, offered special prizes for six dishes of Potatoes of their introduction. The 1st prize went to Mr. E. S. Wills, Edgecote Gardens, Banbury, who had excellent examples; 2nd, Mr. Jas. Sinkins, Shillington, near Hitchin; Mr. W. Pope was 3rd.

The best three dishes of Messrs. Sutton & Sons introduction were from Mr. R. Lye, gr. to W. H. Kingsmill, Esq., Sydmonton Court, Newbury, who had Satisfaction, Abundance, and Sutton's Seedling; 2nd, Mr. F. Peckover, Waddington, Banbury.

The miscellaneous collections formed a remarkable feature. Messrs. Veitch & Sons, Chelsea, had a very large collection of Apples and Pears, and baskets of leading varieties. Messrs. T. Rivers & Son sent from Sawbridgeworth, fruiting trees of Apples, Pears, Plums, Cherries, &c., and also dishes of these fruits. Messrs. G. Bunyard & Co., had a considerable collection; so had Messrs. W. Paul & Sons, Waltham Cross, who also contributed an excellent selection of autumnal Roses. Messrs. Cheal & Sons Crawley, had fruits, and a remarkable collection of Dahlias for the time of year. Messrs. J. Laing & Sons, Stanstead Park Nursery, also had a collection of fruit, many of the Apples finely coloured. Messrs. R. Smith & Co., Worcester, a collection also, and examples of a very promising main crop or late Plum, named Smith's Purple Prolific. Mr. J. Watkins, Pomona Farm, Hereford, had cider Apples, from which he manufactures the well-known champagne cider. Messrs. J. Carter & Co., High Holborn, a collection of varieties of Tomatos of high quality; and Mr. F. Mitchener, Anerley, a collection of Apples.

ROYAL AQUARIUM.

WEDNESDAY, October 14.—A remarkably fine display of Apples and Pears marked this autumn exhibition, whilst Grapes and other choice fruits were largely shown. All classes were well filled, and in the miscellaneous collections there was great variety, as well as much fine quality.

Grapes.—No fewer than five collections of twelve bunches were staged, the best, admirable samples, coming from Gunnersbury Park (gr. Mr. G. Reynolds). The blacks were Alicante, Gros Maroc, and Hamburgh; the whites, Trebbiano, Napoleon, and Muscat of Alexandria. Mr. Wilson, gr. to R. C. Christie, Esq., Roehampton, was a good 2nd. The best three bunches of black Grapes came from Mr. Griffin, gr. to the Misses Christy, Coombe Bank, with very finely finished Alicantes, who was also a good 1st, with fine Muscat of Alexandria, in the white class. Mr. W. Iggulden, Marston Gardens, was 2nd with blacks, having Gros Maroc; and Mr. Davies, Mote Park Gardens, Maidstone, had the 2nd best whites in large coarse Muscat of Alexandria.

Collections of Fruit.—These were not limited to number of dishes, and found five entries. The best, consisting of twenty-eight dishes, came from Mr. Blair, Trentham Gardens, and included Queen Pines,

Muscat of Alexandria, white, and Hamburg, Alicante, Madresfield Court, and Gros Colmar Grapes, with numerous Apples, Pears, Plums, Figs, and late Peaches. Mr. Reynolds was 2nd, with twenty-one dishes, and Mr. Davies was 3rd.

Pears were shown largely. The best collection, comprising sixty dishes of generally good samples, came from Mr. Davies, who, in this case, fairly beat Messrs. Cheal & Sons, Crawley, and Mr. Bunyard, of Maidstone, who came 2nd and 3rd. Remarkably fine were the twelve dishes shown by Mr. Blick, gr. to Martin R. Smith, Esq., Hayes Common, who had capital samples of Glout Morcean, Pitmaston Duchess, Conseiller de la Cour, Doyenné du Comice, Marie Louise d'Uccle, Durondeau, Beurré Bachelier, Magnate, Marie Louise, Beurré Diel, and Emile d'Heysch, Mr. Davies and Mr. Cook, Compton Bassett Gardens, came 2nd and 3rd. Mr. Bridger, Penshurst Place Gardens, had the best six dishes of Pears.

Apples.—Large collections of these were shown, those in the competition for the unlimited class were exceptionally good. Messrs. G. Bunyard taking 1st place with 120 dishes; Mr. John Watkins, Hereford, coming 2nd; and Mr. Waterman, gr. to L. C. Brasey, Esq., Aylesford Hall, being 3rd with eighteen dishes. Mr. Davies was 1st for seven, his fruits, such as Peasgood's Nonsuch, Warner's King, Alfriston, Sandringham, and Winter Hawthornden, being very fine; Mr. Bridgeman, 2nd. The best six dessert Apples came from Mr. A. Wyatt, Bedford, having Ribston, King, and Fearn's Pippin; Worcester Pearmain, Duchess' Favourite, and Margil, all first rate. The best six kitchen kinds were from Mr. Bridger, who had beautiful samples of Stirling Castle, Bismarck, Warner's King, The Queen, New Hawthornden, and Alexander; Mr. Sage, Ham House Gardens, was 2nd with some grand fruits. Of non-competing collections, Messrs. Cheal & Sons, Messrs. J. Laing & Sons, Messrs. Lee & Sons, Messrs. Paul & Sons, Messrs. Peed & Sons, and Messrs. R. Smith & Co., Worcester, had great variety. Mr. Watkins showed various Cider Apples.

Tomatoes were plentiful, Mr. E. Ryder, Orpington, and Mr. Norman Davies having the best collections, which included the best known varieties. The vegetables were good, the prizes for twelve dishes being taken by Messrs. Wilkins, Norwood House Gardens, Bladford; Mr. E. Lye, Symontou; and Mr. Waite, Glenhurst, Esher; the average quality being so good that it was hard to apportion the awards. Messrs. Sutton & Sons, Reading, offered prizes for single dishes of vegetables. Mr. Lye had the best Beets and Leeks; Mr. Wilkins the best Carrots and Onions. Mr. Waite the best Cauliflowers. Mr. T. Hosmer, Meopham, Kent, the best Parsnips; and Mr. Bury, Forest Hill, the best dish of Tomatoes.

Plants and Flowers.—Messrs. J. Laing & Sons, Forest Hill, showed a large group of Begonias in pots. Messrs. Cannell & Sons, Begonias, just lifted from the open ground, and cut Chrysanthemums. Messrs. W. Paul & Sons, cut Roses and hardy flowers. Messrs. Cheal & Son, Dahlias, &c. Mr. Jones, Lewisham, Chrysanthemums in pots. Mr. Pritchard, Christchurch, hardy flowers set in moss. Mr. Salmon, West Norwood, French Marigolds; Mr. Owen, Maidenhead, a good collection of cut blooms of Chrysanthemums, many from plants raised from seed sown last January; and Mr. Powell, Hornsey, had capital dwarf plants of Madame Desgranges and Guernsey Chrysanthemum, finely flowered.

appear to be as healthy and vigorous as ever, but it does not bear one-tenth as many nuts as it did ten years ago. The last three years the outer shell of the nut has been soft, and never gets hard as formerly. I shall feel very much obliged if in your next issue you will say if anything can be done to improve the bearing of this tree. *F. M.*"

MARKETS.

COVENT GARDEN, October 15.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal sale-men, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Conns still sell fairly, with a downward tendency. Apples better trade. *James Webber, Wholesale Apple Market.*

POTATOS.

Arrivals this week rather light. Trade for best kinds rather better, at a slight advance in price. Commoner kinds about same as previous quotations. *J. B. Thomas.*

NOTICES TO CORRESPONDENTS.

APPLE TREES IN INVENTORY OF A MARKET GARDEN: *N. B.* When a tree ceases to bear well, it should not be inventoried. The age of an Apple tree would scarcely have anything to do with it.

AAUCARIA IMBRICATA TO DRY: *T. C. S.* Fasten the scales of the cone with a rather close network of very fine florists' wire, and hang up in the shade until dry.

BOOKS: *Cymourus.* See a letter by "F. W. B." in our Home Correspondence, p. 461, of this week's issue. You would have to attend Science Classes at some institution which is in connection with the Science and Art Department at South Kensington. Send for prospectus.—*L. G. Hand-*

book of Hardy Trees and Shrubs, &c., by Decaisne, Naudin, and Hemsley (Longmans & Co., London). *Greenhouse and Stove Plants,* by T. Baines (John Murray, London). *Select Ferns and Lycopods,* by B. S. Williams, Victoria Nurseries, Upper Holloway: sold by same firm. *The Scientific and Profitable Culture of Fruit Trees;* translated from the French of M. Du Breuil, by W. Wardle (Lockwood & Co., Stationers' Hall Court, London).

BROWN SCALE, AND FUMIGATION WITH CAMPBELL'S FUMIGATOR: *W. M.* Will it not be better to extend your observations of the effects of the fumigation? If none of the scale-insects grow in size in the course of a few weeks, there will be no doubt of the efficacy of the remedy.

CYPRIPEDIUM: *Major M.* The flower sent does not tally with the description, but we cannot say of our own experience whether it is the true variety or not.

DRESSING WHEAT: *Pro and Con.* The dressing applied to seed Wheat or other grain destroys any spores that may be present. The spores are scattered everywhere by the wind, and readily infest the plant as soon as it sprouts. The dressing makes the seed-corn unpalatable to birds, mice, &c.

FRUIT FOR MARKET PURPOSES: *H. K. S.* *Six Apples:* New Hawthornden, Cox's Orange Pippin, Worcester Pearmain, Lane's Prince Albert, Bramley Seedling, Lord Grosvenor. *Six Pears:* Williams' Bon Chrétien, Louise Bonne of Jersey, Beurré d'Amanlis, Marie Louise d'Uccle, Marie Louise, Knight's Monarch, Glout Morcean. *Six Plums:* Belgian Purple, Reine Victoria, Kirke's—dessert varieties; The Czar (Rivers), Grand Duke (Rivers), Victoria (Denyers)—culinary vars. The Czar for very early, and Grand Duke for late fruiting, cannot be too much recommended, as they extend the season of Plums to nearly three months, the one ripening on bushes or standards about the end of July, and the other about the third week in October.

FUNGUS ON PEARS: *G. W.* When the fungus (*Fusicladium*) has attached itself to the rind of the fruits and run its course, there is nothing that you can do beyond destroying the fruits by fire; by so doing you will destroy some spores, but there will be millions more floating in the air next summer, ready to take advantage of, to them, favourable conditions, to attack the young Pears. The means taken to check the spread of other minute fungi, as sulphate of copper in solution, might be employed against this one by means of a spray-pump. Two or three thorough sprayings would probably be an effectual check, but the first one should be performed whilst the fruits are quite small.

MAYFARTH'S DRYING APPARATUS: *H. G.* Any questions with regard to this useful invention would doubtless be answered by Mr. Barron, Royal Horticultural Society's Gardens, Chiswick, on application.

NAMES OF FRUITS: *R. J. J.* Pears: 19, Vicar of Winkfield; 20, Doyenné du Comice; 21, Passe Colmar; 22, Glout Morcean; Apples: 14, Court of Wick; 15, Yorkshire Greening; 16, Brownlee's Russet; 17, Royal Russet; 18, Beauty of Kent; Grape: 24, Royal Muscadine.—*W. M.* 1, Doyenné du Comice; 2, Beurré Clairgeau; 3, Knight's Monarch; 4, Williams' Bon Chrétien; 5, Beurré Bosc; 6, Foselle.—*J. S.* 1, Hacon's Incomparable; 2, Souvenir du Congrès; 3, Louise Bonne of Jersey; 5, Williams' Bon Chrétien; 6, Beurré d'Amanlis.—*John Huggins.* 1, Ecklinville Seedling; 2, Winter Strawberry.—*G. C.* 1, Beurré Rance; 2, Ecklinville Seedling; 3, not recognised.—*W. R. King.* 1, Mère de Ménage; 2, Beurré Diel; 3, Napoleon; 4, Beurré Hardy; 5, Flemish Beauty; 6, Jersey Gratioli.—*C. P. C.* 1, Blenheim Orange; 2, not recognised; 3, Cellini.—*Bywater.* 1, Vicar of Winkfield; 2, Beurré Clairgeau; 3, Beurré Rance; 4, Bonne d'Ezée; 5, Beurré Hardy.—*E. M. P.* Apple: Gascoigne's Seedling; Plum: Magnum Bonum.—*H. H.* 1, Duchesse d'Angoulême; 2, Louise Bonne of Jersey; 3, Jersey Gratioli; 4, Williams' Bon Chrétien; 5, Lord Derby; 6, Warner's King; 7, Duchess of Oldenburgh; 8, Lord Suffield.—*A. F. G.* 1, Louise Bonne of Jersey; 2, Duchesse d'Angoulême; 3, Figue d'Alençon; 4, Hacon's Incomparable; 5, decayed; 6, unknown, very distinct form.—*Albert Harvey.* 1, Belle de Bruxelles; 2, Bellissime d'Uver.—*O. W. Gray.* Apple: Warner's King; Pear: Grosse Calebasse.—*G. J.* 1, Downton Nonpareil; 2, Bringewood Pippin; 3, Comte

Obituary.

REV. PERCY MYLES.—We regret to have to announce the death of this gentleman at Ealing. He was a graduate of Trinity College, Dublin, where he took high honours, and was not only a scholar but a naturalist. He was known as the Editor of *Nature Notes*, and to gardeners by the valuable glossaries appended to *Nicholson's Dictionary of Gardening.*

ENQUIRY.

WALNUT TREE FAILING TO RIPEN FRUIT.—Would any of our readers kindly furnish *F. M.* with a reason for his Walnut tree failing to ripen its fruits? He says:—"I have in my yard a very fine Walnut tree about 50 years old, the leaves and branches

de Lamy; 6, Plum; Magnum Bonum; 1, Coe's Golden Drop.—*J. H. 1, Kerry Pippin; 2, Red Astrachan; 3, decayed; 4, Claygate Pearmain; 5, Manx Codlin; 6, Lord Suffield; 7, Ecklinville Seedling; Pear: 1, Fondante d'Automne.—G. T. C. Pear: Souvenir du Congrès.—R. R. Davidson. Pear: Chaumontelle; Apple: 1, Dumelow's Seedling; 2, not known.*

NAMES OF PLANTS.—*A. P. Spiraea Fortunei.—J. M. Deafontainea formosa.—A. H. Lycesteria formosa.—D. E. 1, 2, and 4, all varieties of Cupressus Lawsoniana; 3, Thuya gigantea; 5, Cupressus nutkanensis alias Thuiopsis borealis; 6, Juniperus communis.—F. C. Nigella hispanica, not truly wild, but often introduced with foreign Clover or other seed.—W. E. Guizotia oleifera, a Composite.—A. C. Cocoloba platycladon.—Tush, 1, Wild Service tree, Pyrus torminalis; 2, Aster, not known; 3, Centaurea ruber; 4, Vinca major; 5, Scabiosa sp.; 6, Cotoneaster microphylla—why send such wretched scraps?—E. J. C. 1, Quercus coccinea; 2, Magnolia acuminata; 3, the Azore Island form of Prunus lusitanica; 5, Leucothoe axillaris; 6, a Cupressus, perhaps Goveniana—we cannot tell from the scrap sent. *J. C. Cinnam erubescens. Send fruiting spray of tree with berries.—T. C. Euonyma europæus.—J. C. & Co. Viburnum opulus.—J. B. Oncidium prætextum; Cattleya, we cannot express an opinion on your plant from your description.—W. H. S. Miltonia spectabilis var. Morelliana, one of the best that we have seen.—J. P. Eranthemum tricolor.**

PEAT MOSS LITTER: *T. B.* It should be thrown into large heaps, and fermented, so as to hasten its decomposition, and it may then be used as a dressing, by preference, on soils that need something added to increase their porosity as well as their fertility. These are the loams that are of a clayey nature. The materials would serve as a mulch on flower beds and borders, for Raspberry plantations, Asparagus beds, and when partially decayed as a manure for Celery. As the peat moss absorbs the greater proportion of the urine of the animals, it should not come near the roots of plants in a fresh state. It would prove a valuable winter dressing to heavy Grass land.

POTATO: *J. A. C.* We are not surprised at the occurrence, particularly as the "eyes" still retain a purple tinge. We cannot name the variety.

POTATO SATISFACTION: *H. K. S.* Sutton's Satisfaction is a fine-looking, good-eating tuber, resisting the disease well.

TENNIS LAWN DRESSING: *Beta.* Almost any kind of dressing does Grass good, if applied at the right time. If the lawn is well drained, something better than road grit should be put on it, for as the removal of the mown Grass gradually reduces the fertility of the land, a manurial aid is required to keep the sward fresh looking. Apply sifted loam one-half, and decayed manure and wood ashes one-half. Let everything be passed through a sieve or gravel screen, and applied in such quantity as not to hide the turf from view; say, ½-inch thick, and evenly. Do this in mid-winter when the land is frozen, and will bear a wheelbarrow without making wheel-tracks. It will have disappeared by the time the Grass begins to grow.

TUBEROUS BEGONIAS: *F. Geeson.* We think your seedlings are almost as fine as any that we have yet observed at metropolitan exhibitions.

VINE ROOTS: *J. R.* The roots are in a very bad state; probably the result of an insufficiently-drained border. We see plenty of dead insects, but no phylloxera.

VIOLA BLOOMS: *J. Forbes.* Exceedingly good blooms for the time of year. Varieties well adapted for an extended display from spring to the present time. As a rule, these plants do better in your country, and in the north generally, than "down south."

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 16 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

London Road Car Company (Limited).

Letters so addressed are opened by the
authorities and returned to the sender.*

S A N D E R S , St. Albans, can thoroughly
RECOMMEND several first-class **HEAD GARDENERS.**

To Noblemen and Gentlemen requiring Land Agents,
STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all
times upon their Register reliable and competent **MEN,**
several of whom are personally well known to Messrs. Carter.
Enquiries should be made to 237 and 238, High Holborn, W.C.

B. S. WILLIAMS AND SON beg to intimate
that they have at present in their Nursery and upon
their Register some excellent **MEN,** competent either to fill
the situation of **HEAD GARDENER, BAILIFF, FOREMAN,**
or **JOUBNEYMAN.** Ladies and Gentlemen requiring any of
the above will please send full particulars, when the best
selections for the different capacities will be made.—Victoria
and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester
(Limited), are always in a position to RECOMMEND
MEN of the highest respectability, and thoroughly practical
at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

THE LIVERPOOL HORTICULTURAL
CO. (JOHN COWAN), Limited, The Vineyard and Nur-
series, Garston, Liverpool, are in a position to recommend a
first-rate man as **HEAD GARDENER, or GARDENER and**
BAILIFF; also a thoroughly competent man as **HEAD GAR-**
DENER, who has a good knowledge of Orchids; no exceptional
references in each case.

Head Gardeners.
JOHN LAING AND SONS can at present
recommend with every confidence several energetic
and practical **MEN** of tested ability and first-rate character.
Ladies and Gentlemen in want of **GARDENERS and BAILIFFS,**
and **HEAD GARDENERS** for first-rate Establishments or
Single-handed Situations, can be suited and have full particu-
lars by applying at Stanstead Park Nurseries, Forest Hill,
London, S.E.

RICHARD SMITH AND CO.
beg to announce that they are constantly receiving
applications from Gardeners seeking situations, and that
they will be able to supply any Lady or Gentleman with
particulars, &c.—St. John's Nurseries, Worcester.

Everybody Coughs, except those who take
DR. LOCOCK'S PULMONIC WAFERS, which stop a cough at once—relieve the breathing—loosen the phlegm, and produce ease and comfort truly astonishing—**DR. LOCOCK'S WAFERS** instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Colds, Shortness of Breath, Pains in the Chest, Rheumatism—and taste pleasantly. Sold at 1s. 1/3d., 2s. 3d., 4s. 6d., and 11s. per box, by all Druggists

HOLLOWAY'S PILLS.—In cases of chronic indigestion, disordered liver, and general debility, these Pills are wonderfully effective. They, indeed, have so general and powerful an effect on the whole system, that they clear away or ward off most of the ills that flesh is heir to. They cleanse the bowels, purify the blood, correct the bile, give tone to the stomach, excite a healthy appetite, produce sound sleep, and impart increased energy to both mind and body. The admirable properties of these far-famed Pills are too highly appreciated to require any encomium here, as they are resorted to by rich and poor of every nation. The cures they effect are not temporary or imperfect, but they bring about a marvellous and most beneficial change throughout the entire body, and enable it, with renovated powers, to resist the approach of all future attacks.

On view morning of Sale, and Catalogues had.

Wimbledon.—Expiration of Lease.

CLEARANCE SALE of about 4½ acres of exceptionally well-grown and thriving **NURSERY STOCK,** growing upon a portion of the Nursery the lease of which is about to expire, by order of Messrs. D. S. Thomson & Sons. **IMPORTANT to MARKET GARDENERS, GENTLEMEN, NURSERYMEN, and OTHERS.**

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION on the Premises, the Nurseries, Wimbledon, about five minutes' walk from Wimbledon Station, on **MONDAY** and **TUESDAY,** October 26 and 27, at 12 o'clock precisely, Without Reserve, 800 Standard and Pyramid Apples, Pears, and Plums; 350 Standard Cherries, 800 Dwarf-trained Apples, Pears, and Currants; 5,000 Currants and Gooseberries; 2,000 Laurels, of sorts; 1,500 Weymouth and Austrian Pines; 900 broad-leaved Privet; 200 green Hollies, 3 to 4 feet; 150 well-furnished English Yews, 4 to 5 feet; 900 Standard and half-standard Roses, 1,700 Border Shrubs, in variety; 4 to 7 feet; 1,300 Limes, 8 to 14 feet, fine Avenue trees with short stumps; 40 Lombardy Poplars, well furnished; 12 to 15 feet; 300 Standard Planes, Thorns, and other Ornamental trees, &c.

May be viewed any day (Sunday excepted) prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Cheshunt.

ABSOLUTE CLEARANCE SALE of unusually well-grown **NURSERY STOCK,** in consequence of the expiration of the Lease of this Branch Nursery. By order of Messrs. Paul & Son.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to **SELL** by AUCTION, on the Premises, The Church Fields Nursery, Cheshunt (one mile from Cheshunt Station), on **WEDNESDAY** and **THURSDAY,** October 28 and 29, at 12 o'clock precisely each day, without reserve, about 12 acres of unusually well-grown **NURSERY STOCK,** in the best possible condition for removal, consisting of—

29,000 AVENUE TREES, 10 to 25 feet, with straight stems, carefully transplanted, and

SPECIALY ADAPTED FOR STREET PLANTING.

Including 10,000 LIMES, with good heads,

5000 Spanish and Horse CHESTNUTS, POPLARS, OAKS, and PLANES,

5000 BOX, large quantities of oval-leaved PRIVET, Scotch ROSES,

10,000 BUSHY AUCUBAS, 1 to 5 feet, undoubtedly the best lot in the Trade.

Specimen RHODODENDRONS, ARAUCARIAS, and variegated HOLLIES, Dwarf-trained and Pyramid FRUIT TREES, CURRANTS and STRAWBERRIES, of the best sorts, RASPBERRIES, and NUTS.

THE FINEST COLLECTION OF FLOWERING SHRUBS IN THE COUNTRY.

Including the

New Dwarf Flowering and Double LILACS,

THOUSANDS OF EVERGREENS.

suitable for London and Suburban Gardens; and other Stock.

May be viewed any day (Sunday excepted) prior to the Sale. Catalogues may be had on the Premises, of Messrs. PAUL and SON, The "Old" Nurseries, Cheshunt; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

NOTE.—The opportunity afforded by this Sale to intending purchasers is unique. No Sale has ever been held at these Nurseries, the stock having been prepared without any idea of a public sale, which now arises solely through the expiration of the Lease of this Branch Nursery.

The Auctioneers desire to call the particular attention of Public Companies, Local Authorities, and others to the unrivalled and extensive Stock of Avenue Trees, Aucubas, Evergreens, and Flowering Shrubs.

Havant.

East Dulwich, Wednesday, October 28.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Seeger & Tropp to **SELL** by AUCTION, on their Premises, The Orchid Nurseries, East Dulwich, London, S.E., on **WEDNESDAY,** October 28, commencing at half-past 12 o'clock precisely, a most varied Collection of Choicest Established and Imported ORCHIDS, the whole of which are in best possible health and condition. Among the most valuable and rarest species and varieties catalogued will be found the following:—

Grammatophyllum Szegei-anum, new	Cattleya Mossie Rembeckiana (sepals and petals pure white)
Sobraha macrantha Kienastiana, pure white macrantha.	Cattleya Gaskelliana nyca (sepals and petals pure white)
First-class Certificate, Royal Horticultural Society	Cattleya Fausta
Lodia Perrini alba (not nyca)	Renanthera Storiei, fine specimen
Cattleya intermedia alba	Angracum grandiflorum
Phalenopsis Sanderiana alba	Coleogyne Meycram, punctate type
Trichopha suavis alba	Masdevalla Schroderae, First-class Certificate, R. H. S.
Lodia anceps alba	Masdevalla Veitchii grandiflora, fine specimen
Coleogyne cristata alba	Eulophia Guineensis
Lodia autumnalis alba	Anaethochilus, the leading species
Lyaoste Skammeri alba	Vanda tricolor cinnamomea
Dendrobium lobale album	Cypripedium, a choice selection, &c. &c.
Ocloglossum nebulosum album	
Zygotetralium Mackayi album	
Sobraha leucocaulis grandiflora (alba)	
Vanda Staueana, grandest specimen in Europe	

The Sale will also include a splendid importation of the marvellous **ODONTOGLOSSUM HASTILARIUM,** just arrived in grand order.

The entire list, with a few exceptions only, will be offered **ENTIRELY WITHOUT RESERVE,** in order to make room for new importations due to arrive soon, this course being necessary, as owing to a short tenure of the Premises, it is not possible to increase the house accommodation.

Plants may be viewed two days prior to day of Sale, and Catalogues obtained on the Premises; also of the Auctioneers, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C.

The nearest Railway Stations are:—East Dulwich, Denmark Hill, Herne Hill, Lordship Lane, and Peckham Rye.

Plaistow, Essex.

UNRESERVED SALE of the whole of the well-grown **NURSERY STOCK,** by order of Mrs. Holmes, the land having been let for other purposes.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION, on the Premises, The Nursery, High Street, Plaistow, Essex, close to Plaistow Station, on **MONDAY,** October 26, at 1 o'clock precisely, without reserve, 300 AUCUBAS, 9 to 24 inches, fine plants for potting; also larger AUCUBAS, 3 feet; 1000 PRIVET; 200 green EUCONYMIUS, IRISH YEWs, good plants in pots, all staked; 1000 VIRGINIAN CREEPERS, and a variety of other stock.

May be viewed one week prior to Sale. Catalogues had on the premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.; and Leytonstone.

Annual Sale.—Tottenham, N.

Adjoining the Tottenham Hale Station, Great Eastern Main Line, close to the Seven Sisters and Brace Grove Stations, on the Great Eastern; and also South Tottenham Station, on the Tottenham and Humpstead Railways.

IMMENSE SALE OF NURSERY STOCK.

Friday Next.

A SENSATIONAL EXHIBITION and most important SALE, by order of Messrs. LINDEN, Directors of L'Horticulture Internationale, Brussels.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT October 30, at half-past 12 o'clock precisely.

200 CATTLEYA LABIATA AUTUMNALIS, in Flower; a unique spectacle.

Numerous varieties, in full blossom, surpassing in beauty all hitherto known of this most desirable Or. hid.

A grand lot of New DENDROBES, from New Guinea;

amongst these some distinct-looking, grand species; others in the way, or similar to, DENDROBIUM PHALENOPSIS SCHRADERIANUM.

These plants are in capital condition, semi-established, and finer than those already sold.

Good semi-attached plants of ODONTOGLOSSUM (COCHLIODA) NOZZLIANUM, some in flower.

Also of the most charming MEIOSPINIDIUM VULCANICUM GRANDIFLORUM, some in flower.

Semi-established plants of one of the most astonishing and sensational importations ever made.

ONCIDIUM LEOPOLDI ROLFF, the King of Oncidiums, together with

CYPRIPEDIUM VEXILLARIUM SPENDIDISSIMUM, in flower.

GENANTHUM SUPERBUM, in flower.

ARTHURIANUM, in flower.

All the plants are in wonderful condition.

On view morning of Sale, and Catalogues had.

Friday Next.

IMPORTED by WALTER KEMSLEY AND CO., 147, Leadenhall Street, London, E.C.

NEW CYPRIPEDIUM INSIGNE VARIETY.

A full description of this is given by Mr. H. Ridley, of the Botanical Gardens, Singapore, in the Gardeners' Chronicle, July 25, 1891. An extract from his remarks is appended.

"It is very distinct as a variety, both in form and colouring. The leaves are shorter and more crowded, the scape shorter, the flower rather smaller than that of the typical form. The general colouring is similar to that of the Nepal plant, but the white margin of the standard is broader, and runs right down to the base; the purple spots are crowded into the middle of the bright apple-green centre. The chid is different in shape.

"It is decidedly a charming plant of very neat habit, and appears to be floriferous. It will be welcomed by the lovers of Cypripedia."

A drawing taken from a plant in bloom in Singapore will be exhibited at the Sale, and the whole shipment, consisting of about 400 plants in fine condition, will be offered.

MESSRS. PROTHEROE AND MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, October 30. On view morning of Sale, and Catalogues had.

Wanstead.

About 1 mile from Snaresbrook, Leytonstone, and Forest Gate Stations.

CLEARANCE SALE, without reserve, by order of Mr. Thomas East, who requires the land immediately for Brickmaking. The First Portion of the well-grown NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, The Nurseries, Wanstead Flats, Wanstead, E., on FRIDAY, October 30, at 12 o'clock, 3,000 Aneura japonica, 1 to 4 feet, including many hand-ome and bushy plants, Andromeda, English Yews, 1,000 fine Laurels, White and Purple Lilacs, Eucalyptus, Daphne Cneorum, 3,000 Green and Variegated Hollies, selected Fruit Trees, 1000 Roses in choice assortment, a large quantity of Limes, Poplars, and other Ornamental Trees, Scotch and Austrian Pines, and other Stock.

May be viewed one day prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, and Leytonstone.

1000 Plants of the Old Labiata.

This is LINDLEY'S CATTLEYA LABIATA, from Swainson's Hunting Grounds.

NOT GARDNER'S LABIATA.

It has no Synonym.

IT IS THE TRUE OLD TYPICAL PLANT.

EVERY PLANT IS TRUE CATTLEYA LABIATA OF LINDLEY, GUARANTEED.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. E. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, November 6, at half-past 12 o'clock, a magnificent importation of the true old autumn-flowering CATTLEYA LABIATA, consisting of Upwards of 1000 Plants IN SPLENDID CONDITION.

ALL THE PLANTS ARE GUARANTEED TRUE.

The genus Cattleya was founded upon the species we now offer. Dr. Lindley first described it from Swainson's plant, introduced in the year 1818, and named it in honour of W. Cattley, E.q., of Barnet. This plant, now re-discovered and re-introduced, is absolutely the CATTLEYA LABIATA from Swainson's original hunting ground.

CATTLEYA LABIATA TRUE,

the queen of Cattleyas, and the finest of the genus.

The old labiata is a free-flowering Cattleya, and makes rapid growth, and is unequalled for cut-flower purposes and grandeur of variety.

Cliffe, near Rochester and Gravesend.

Adjoining Cliffe Station, S. E. Railway.

THIRD GREAT ANNUAL TRADE SALE OF FRUIT TREES, by order of Mr. W. Horne.

IMPORTANT to NURSERYMEN, FRUIT GROWERS, and OTHERS.

 Also, 10 and 12, MARKET STREET, MANCHESTER.

**CANNELL'S
 TUBEROUS BEGONIAS.**

We are quite certain that all lovers of the Begonia can readily imagine the labour and anxious care that we have bestowed upon it for many years, to bring it to its present indispensable position, and they will also understand how desirous we are to ascertain direct from those who have had them their actual opinion, good, bad, or indifferent. And the same with our Vegetable and Flower Seeds that we have supplied; we shall at all times be further pleased to receive specimens of any really improved kinds of either, from whoever may possess such.

Mr. W. F. MACKENZIE, The Gardens, Thurso Castle, Thurso, N.B., September 28th, 1891.

Gentlemen,—No doubt you will be glad to hear how the Begonias we had from you have succeeded in the extreme north. They have proved far beyond my most sanguine expectations. The brilliancy and profusion of the flowers were marvellous, while some of them measured within a fraction of 6 inches across, and they are the admiration of every one who sees them.

Ashleigh, Inchfield, Wolverhampton, July 18th, 1891.

Dear Sirs,—I cannot refrain from sending you a few lines to say how thoroughly I am satisfied with the Seedling Begonias I had from you this spring. I send you by this post a flower which is a fair sample of the bulk, and certainly there was nothing to compare with them in the show recently held here. The other plants are a so very fine.—I am, dear Sirs,
 Yours faithfully, JNO. H. BIRCH.

H. CANNELL & SONS,
 SWANLEY, KENT.

LINDEN'S

GRAND EXHIBITION AND SALE BY AUCTION

OF

CATTLEYA LABIATA AUTUMNALIS IN BLOOM.

 A UNIQUE SPECTACLE NEVER BEFORE SEEN in LONDON,
Worthy of being witnessed at any sacrifice of time or outlay.

UPWARDS OF 200 CATTLEYA LABIATA IN BLOOM,
OTHERS IN SHEATH.

Numerous Emergent Varieties in Full Blossom, surpassing in beauty all hitherto known of this most desirable Orchid.

MESSRS. PROTHEROE & MORRIS,

AT THEIR ROOMS, 67 and 68, CHEAPSIDE, LONDON, E.C., will EXHIBIT and OFFER for SALE, on
FRIDAY NEXT, October 30,

A MAGNIFICENT LOT OF REAL, TRUE, CATTLEYA LABIATA,
Plants in bloom, and in sheath, evincing in themselves THEIR AUTHENTICITY (see *Gardeners' Chronicle* of last
week, October 17, ROLFE'S description, page 452).

MESSRS. LINDEN are the FIRST REAL RE-IMPORTERS of the CATTLEYA LABIATA of Lindley,
and were so eighteen months ago.

Amateurs purchasing Messrs. LINDEN'S PLANTS IN BLOOM will have no need to wait till they blossom
before being certain of the VALIDITY OF WHAT THEY ACQUIRE.

 *The opportunity of seeing these extraordinary varieties in bloom (a unique spectacle), will not present itself again
for a long time to come.*

Also the whole Importation of a magnificent NEW FORM of LABIATA,

CATTLEYA MAJESTICA — ONE PLANT IN FLOWER.

Also a GRAND LOT of NEW DENDROBES from NEW GUINEA, semi-established and unflowered in mag-
nificent condition; some QUITE NEW, some supposed to be DENDROBIUM PHALÆNOPSIS SCHRODERIANUM
—PLANTS MUCH FINER than those sold last week; the rare white DENDROBIUM LEUCOLOPHOTUM.

Also COCHLIODA NOTZLIANA and MESOSPINIDIUM VOLCANICUM
GRANDIFLORUM, both in bloom. Two grand things they are!

Also some semi-established plants of the marvellous ONCIDIUM LEOPOLDI, Rolfe.

FRUIT TREES—FRUIT TREES.

HUGH LOW & Co.

Offer, of good quality, and will esteem the favour of Orders:—
APPLES—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
APRICOTS—Standard, and Standard Trained.
CHERRIES—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
PEARS—Dwarf Maidens, Dwarf Trained, Pyramids, Standards.
PLUMS—Dwarf Maidens, Dwarf Trained, 2-yr. Untrimmed, Pyramids, Standards.
DAMSONS, FARLEIGH PROLIFIC—Dwarf Maidens, Pyramids, Standards.
PEACHES AND NECTARINES—Dwarf Maidens, Dwarf Trained, Standards, Standard Trained.
Quantity Large—Quality Good—Prices Moderate.
 INSPECTION INVITED.
Bush Hill Park Nursery, ENFIELD.

Many Acres of Lilies of the Valley!
T. JANNOCH, Largest Grower of LILIES OF THE VALLEY in the Kingdom, offers 3-year-old flowering Crowns for forcing, and 2 and 1-year old Crowns for planting out, of unsurpassed quality. Hundreds of Testimonials. Time of sending out, November 1 to May 1. Prices and terms on application.
T. JANNOCH (Lily of the Valley Grower by special appointment to H.R.H. the Prince of Wales), Dersingham, King's Lynn, Norfolk.

JAMES VEITCH & SONS,
 ROYAL EXOTIC NURSERY,
 CHELSEA, LONDON, S.W.

E. P. DIXON & SONS,

THE NURSERIES,

HULL, BURTON, CONSTABLE, AND CONISTON,

Beg to invite inspection of their extensive stock of FOREST and ORNAMENTAL TREES and SHRUBS, FRUIT TREES, ROSES, &c., which are all well-grown, extremely hardy, finely-rooted, and well-furnished, frequently transplanted, and such as will remove with perfect safety, and give the highest satisfaction.

FOREST AND ORNAMENTAL TREES.

ASH, BEECH, BROOM, LARCH, SPRUCE FIR, SCOTCH FIR, AUSTRIAN PINE, SYCAMORE, CHESTNUT, OAK, POPLAR, QUICKWOOD, &c.

STANDARD, ORNAMENTAL AND WEeping TREES.

In great variety, and all sizes.

AVENUE AND ROADSIDE TREES.

LIMES, PLANES, CHESTNUTS, FLMS, SYCAMORES, &c. in various sizes, from 8 to 14 feet.

CONIFERÆ.

A large collection of CUPRESSUS LAWSONIANA, ARBOR-VITÆ, JUNIPERS, PICEAS, PINUS, RETINOSPORA, THUJAS, WELLINGTONIAS, &c.

EVERGREEN SHRUBS.

AUCUBA, BOX, BERBERIS, BROOM, HOLLIES, LAURELS, RHODODENDRONS, YEWs, &c.

ROSES—HYBRID PERPETUAL.

TEA-SCENTED, BOURRONS, CLIMBING, &c. A splendid collection of best blooming varieties.

FRUIT TREES.

A large and varied collection of all the leading varieties of PEACHES, NECTARINES, APRICOTS, APPLES, CHERRIES, PLUMS, PEARS, &c.

General Nursery CATALOGUE post-free on application.

SATURDAY, OCTOBER 24, 1891.

ORCHID CULTURE IN BELGIUM.

AMONG the multitude of English people who annually pass through Brussels, there are probably not a few who are interested in the cultivation of Orchids. Such persons cannot do better than spare two or three days to see the collections in and near the Belgian capital, at Ghent, and elsewhere within easy reach. Without going so far as to say that the taste for the cultivation of Orchids has become as general in Belgium as it has done with us, the existence there of societies, and of illustrated and other periodicals devoted to these plants, shows that Belgium is not far behind. About the middle of September, I spent two days—not long enough, but all I could spare—in visiting the private collection of M. Warocqué, at the Château de Mariemont; the business establishments of MM. Linden (L'Horticulture Internationale); and of Mr. Peeters, at Brussels; the small private collections of Mr. Van Imshoot and Mr. Hye-Leyssen, and the nurseries of Messrs. Vuylsteke and Vervæet, at Ghent. I was anxious to have seen the nursery of Mr. Vincke, near Bruges, where I was told the cultivation of Odontoglossums had been brought to perfection—but time was wanting.

Before making any observations on what I saw, it should be mentioned that I did not find anywhere general and varied collections of Orchids. The genera cultivated, indeed, the species, were comparatively few, and in great measure confined to the showy and large-flowered forms. No doubt the real test of cultural skill is the ability to keep in health a varied and extensive collection of genera and species, gathered from all parts of the world, and growing in Nature under very varied conditions. At the same time, Nature can play tricks, if I may use the expression, which Art dare not try. I have seen Saccolabiums and Aërides growing where there were night frosts, and in most seasons snow, in the winter; but no one would like to expose such plants to frost and snow in cultivation. So that, however varied the conditions may be under which plants grow in Nature, it is not desirable to do more than follow such indications generally in cultivation.

Except at Messrs. Lindens', the plants cultivated are mostly Cattleyas, Lælias, Odontoglossums, Cypripediums, and Miltonias, and at M. Warocqué's are Vandas. I may say at once that I have never seen Cattleyas and Odontoglossums more healthy and vigorous. September is not the flowering season for Orchids, so I saw but few plants in bloom. But the vigour and strength of the bulbs left little or nothing to be desired

237
 238 **HIGH HOLBORN, LONDON**

No doubt both at Mariemont and at Messrs. Lindens' the so-called *Cattleya Warocqueana* was present in large numbers. These plants have not been long in the country, and many people grow newly-imported Orchids well enough, only to see them dwindle away when their native vigour is exhausted. But grand as were the *Cattleya labiata* (for the synonym *Warocqueana* must be discarded), the *C. Mendelii*, *gigas*, *Mossie*, *amethystoglossa*, *Leopoldii*, &c., were nearly, if not quite, as good. Since my return to England, I have discussed the Belgian cultivation of *Cattleyas* and *Odontoglossums* with English growers—men of long and wide experience, and able cultivators. They have seen some of the Belgian collections themselves, and some of them thought the growth and bulbs, especially of the *Odontoglossums*, were soft and sappy, and by no means indicative of lasting health and vigour, or of promise for flower. I cannot agree in their view. I brought a few plants home with me, merely as examples of successful cultivation. The bulbs are broad, hard, and bronzed; the leaves thick, stiff, and sturdy; the plants very firm in their pots, owing to an abundance of roots. If such bulbs do not produce good flowers, my experience has taught me nothing. Surely, in Orchid cultivation, as in every other branch of gardening, if you grow plants well you will generally get good flowers; that has, at all events, been my experience. It is the same with the *Cattleyas* and *Laelias*; the bulbs are clean and strong, nearly every one has a flower-sheath; roots are abundant, and the plants have an unmistakable aspect of general vigour. The new "old *C. labiata*" gives indications of being a plant of remarkable vigour, and of excellent constitution. The double-sheaths, whether green or brown, are so well developed, that there is a V-shaped gap between them at the apex.

No one can fail to be struck with the admirable cleanliness, order, and arrangement which characterise the plant-houses of "L'Horticulture Internationale." It would be possible, and in no way unpleasant, to eat one's dinner off any part of these houses. Here there is, much more than elsewhere, a general collection of Orchids—the only popular genera which are sparsely represented being those of *Phalænopsis*, *Dendrobium*, and *Maderallia*. I may here observe that *Dendrobium*, bulbous *Calanthes*, and other winter or early spring-flowering Orchids do not seem much in favour in Belgium. The "Société Anonyme" maintains several collectors, among them *Bungeroth*; and *Monsieur Linden* (père) has so wide a knowledge of what are still the great botanical hunting-grounds in northern South America, that he is able successfully to direct the collecting staff. I heard of many treasures which had been sent over to the company—new *Cattleyas*, *Odontoglossums*, *Oncidiums*, &c., including a blue *Oncidium* of the *O. macranthum* section. As to these, I say:—

"Segnius irritant animos demissa per aures,
Quam quæ sunt oculis subjecta fidelibus,"

which in the vulgar tongue is tantamount to "seeing is believing." But whatever may be the future treasures in store for us, my "faithful eyes" saw several plants of interest, recently introduced, in flower. Among them was *Cochlioda Noezliana*, a very distinct and pretty plant, a *Mesospidium*, but of a peculiar rosy-vermillion tint. Others were, a pretty little yellow and white *Dendrobium*, with a long flat bulb, shaped like a fish; an *Aganisia*, like *A. coerulea*; a yellow *Trichocentrum*, resembling *Trichopilia Galeottiana*; a pretty *Cirrhopetalum*, like a large *C. Mastersii*; a fine *Mormodes*, a yellow *Catasetum Bungerothii*, a fine *Coryanthes*, &c. There were besides, of course, *Cattleyas*, *Vandas*, *Odontoglossums*, &c., in flower.

The collection at the Château de Mariemont

has been made, I believe, under the direction and guidance of *M. Lucien Linden*. In addition to the *Cattleyas*, *Laelias*, and *Odontoglossums* already referred to, there are some very fine and vigorous *Vandas*, and a few good *Cypripediums*, and other things. *Vanda Lowii* is remarkably well grown; the plants are well-rooted, and carry leaves to the surface of the pot. One plant I saw was fully 8 feet high, with five young growths from the stem; and another, which had unfortunately been killed by frost on its way from a show, had required to have a hole in the ground a metre deep made for it. There is not in this collection any one *Vanda Lowii* equal to the celebrated plant at Ferrières, but the species is admirably grown. I noted also at Mariemont as exceptionally fine, *Oncidium incurvum*, *Odontoglossum Edwardii*, with a spike like a walking-cane, and ten branches; and fine pans of the sweet-scented and lovely *Odontoglossum pulchellum*. The bulb of one *Odontoglossum crispum* was 5 inches high by 3½ broad, and there were many nearly as large. *Odontoglossum grande* was in flower, and very vigorous. *Vanda Batemannii* and *V. Kimballiana* were finely bloomed, the latter with twenty-one brilliant-lipped flowers on its spike. *Vanda Sanderiana* was doing well.

At the nursery of *M. Vuysteke*, at Loo-Christy, near Ghent, *Odontoglossum crispum*, *O. Pescatorei*, and *O. grande*, are largely and successfully cultivated. The bulbs are fine, the foliage dwarf and sturdy, and the spikes, judging from what remains of them, had been grand. I noticed a little mildew on some of the leaves, and the chalky water disfigures them, but the plants, speaking generally, were thoroughly well-grown. The *Cymbidium* in this nursery, especially those of the *C. Lowii* section, were very fine.

At Messrs. *Vervæet et Cie.*, the *Odontoglossums* had been lately divided, repotted, &c. They appeared to have been fine and well cultivated, but require time, of course, to recover from their late treatment. *M. L. Linden* told me that this firm's connection with Orchids began by their purchase of some boxes of *Odontoglossums*, sent over from Bogota by Jesuit priests. Among these, which may possibly have been cultivated by the reverend fathers, a large number of fine and special varieties appeared. The *Cattleyas*, *Laelias*, and *Cypripediums* at *MM. Vervæet's* were very fine, as fine as those at *Mariemont*. The specimens are, many of them, in tubs raised on stands, leaving room for small Palms between them.

The collections at *M. Van Imshoot's* and *M. Hyeleyssens's* are small, but interesting.

It only remains now for me to notice the plants at the nursery of *Mr. Peeters*, *Chaussée de Forest*, Brussels. *Mr. Peeters* himself showed me his plants, which were, I thought, most creditable to his skill as a cultivator. The *Cattleyas*, *Laelias*, and *Odontoglossums* here again looked remarkably healthy and vigorous, especially the *Odontoglossums*, which were equal to any I saw in Belgium. Among the plants were several fine pans of *Miltonia Morelliana*, in vigorous health, and a house full of *Cypripediums* doing well.

The *Miltonia vexillaria* and its allies are certainly not grown in Belgium with the exceptional vigour shown by the cool *Odontoglossums*, nor did I anywhere see a good plant of *Cattleya Skinnerii*. *Phalænopsids* are few and far between. The general impression left on my mind was, that such genera as find favour in Belgium are admirably grown. As the taste for Orchids spreads, and becomes more cultivated, growers will learn to appreciate the beauty, variety, and interest to be found among the many genera and species of comparatively small and modest Orchids. I see no reason why these should not be as well grown in Belgium as are now the bold and showy ones.

The only material differences in practice to be observed in Belgium are the invariable use of the fibrous roots of the *Polypodium vulgare* instead of peat, which is never used, in the potting compost; and the equally invariable employment of the midribs of Tobacco leaves, placed on wire netting over

the pipes and occasionally moistened, to keep down thrips and other insect pests. As to peat, every Orchid-grower has seen plants innumerable of nearly every genus growing luxuriantly in a compost of which it formed a part. The *Polypodium fibre* (*terre fibreuse*) is, however, to all appearance, an excellent potting material, with little waste, and is well worth a trial. The Tobacco-leaf stems diffuse a very perceptible, but not unpleasant, odour in the houses, especially when fresh; and if to them belongs the credit of the absence of insect pests from the houses, as is at least probable, their use is a great help to the cultivator, and saves endless trouble. The collections I saw were all of them remarkably clean and free from insects; but—and it is a large but—Tobacco in this form is both costly and difficult to procure in sufficient quantities in England. It struck me that less artificial heat was used, and more air given, than with us; but the weather was warm. Wooden blinds (*claires*) are nearly always used instead of canvas; they certainly let in more sun, without the risk of burning.

I should not like to conclude these remarks without expressing my obligations to *Monsieur Lucien Linden* for the great courtesy and attention he showed me while at Brussels. Thanks to him, and the arrangements he so kindly made, I was able to see a great deal of what I most wished to see in the limited time at my disposal. I should, however, add that although *Mons. Linden* was an excellent *cicerone*, I did not see with his eyes. The views here expressed are the results of careful observation and unbiassed judgment, and they are shared by my Orchid grower, *Mr. White*, who accompanied me. *T. L.*

NEW OR NOTEWORTHY PLANT.

LILIUM WALLICHIANUM, VAR. SUPERBUM,
*Hort. Low.**

THIS is a very marked variety of *Lilium Wallichianum*, *R. & S.*, if indeed, it should not be regarded as a distinct species. It was introduced about three years ago by Messrs. *H. Low & Co.* from Upper Burma. It differs from the typical *L. Wallichianum*, which is an inhabitant of the Himalayas, of Nepal and Kumaon, by its primrose-yellow flower, suffused on the outside with claret-purple, its brown anthers, and by the presence of large green bulbilla in the axils of the upper leaves. It received a first-class certificate from the Royal Horticultural Society on June 25, 1889, under the name of *L. Wallich superbum*, but the name under which the species was described was *L. Wallichianum*. It was figured and noticed in the *Garden* for April 19, 1890, under the name of *L. nepalense ochroleucum*, but there can be no question that its affinity is with *L. Wallichianum*, not with *L. nepalense*. *L. nepalense*, *D. Don* and *L. ochroleucum*, *Wallich*, are two names for one and the same plant. *Wallich*, whose collectors first gathered the plant in the mountains of Nepal, intended to call it *ochroleucum*. He sent specimens to *Lindley* under this name, and his original drawing, now at Kew, is named *ochroleucum*. But *Don* published the plant as *L. nepalense* in the third volume of the *Transactions of the Wernerian Society*, p. 412, and when *Wallich* published his figure in the third volume of his *Plantæ Asiaticæ Rariores*, tab. 291, he adopted *Don's* name. *General Collett*, who made a large collection of plants in Upper Burma, does not seem to have gathered the present plant, but he got an allied new species of the *Eulirion* group, with erect open funnel-shaped flowers not more than 4 inches long, which, in his paper, written in collaboration with my colleague,

* *Lilium Wallichianum*, var. *superbum*, Hort. Low.— Bulbo magno globoso; caule stricto erecto 6-7 pedali apice cernuo; foliis perpluribus sparsis linearibus viridibus, inferioribus multis brevioribus bulbilla in axillis præditis; perianthio 7-8 pollicari pallide sulphureo extus rubro-purpureo suffuso, tubo late infundibulari, segmentis supra medium falcatis interioribus valde latioribus; staminibus perianthio paulo brevioribus antheris magnis brunneis; stylo curvato antheris superante.

Mr. W. B. Hemsley, and published lately in the *Journal of the Linnean Society*, is described and figured under the name of *Lilium Bakerianum*. This has not yet been introduced into cultivation. My description of *L. Wallichianum superbum* has been made from a fine plant now in full flower at the south end of the new temperate house at Kew, which was presented to the Royal Gardens by Messrs. Low.

Bulb large, globose; stem 6 to 7 feet long, and stiffly erect, cernuous at the apex, green throughout; leaves very numerous, scattered, erectopate, bright green, 3 to 4 inches long, about $\frac{1}{3}$ -inch broad, with only one conspicuous nerve; upper leaves growing gradually shorter, about twenty of them being furnished with large bulbilla in their axils; uppermost leaves lanceolate flowers two or

work of time, requiring an amount of skill and close observation imperfectly understood by those whose experience has been confined to subjects quickly and easily grown, and which may be got from the cutting-stage to full size in the course of one or two years. The position which Mr. Nicholas has maintained at several of the principal exhibitions, including York, Manchester, and others of like character, is evidence of the high cultivation which he has brought to bear on the Upleatham plants.

In the stove department, *Ixoras* were noted as being a strong feature, specimens of *I. Williamsii* and *I. Pilgrimii* are from 4 to 5 feet through, with ample foliage on their vigorous shoots. Of other varieties, including the white *I. alba*, there was a number of thriving young specimens that give a long season of bloom—flowering, as they do, where pro-

of a character such as admits of their being arranged with almost any other description of cut bloom, but from the long continuity of the plants in flower, they fill a place which few other things are capable of doing well.

Franciscea calycina was noted in specimens some 4 feet through, and *Rondeletia speciosa major* of a similar size; both were strong, fully-furnished examples. Of *Anthurium Scherzerianum*, so proverbial for the exuberance of its flowers, there are several large specimens, good forms of this most variable plant. Several large specimens of *Stephanotis* had made excellent growths.

Associated with the above-named plants was a grand plant of *Calanthe veratrifolia*, that in the past spring bore thirty spikes of its long-lasting snowy flowers; *Cypripedium Lawrenceanum*, a fine

FIG. 62.—LODGE FOR GARDEN PUPILS, MISSOURI SCHOOL OF HORTICULTURE, ST. LOUIS. (SEE P. 489.)

three, pendent on long peduncles, fragrant, pale sulphur-yellow tinged outside with claret-red; perianth about 8 inches long, the segments permanently connivent in a funnel-shaped tube, which is about 5 inches long, and 2 to $2\frac{1}{2}$ inches broad at the top when the flower is fully expanded, falcate about one third of the way down; outer segments little over 1 inch broad; inner nearly 2 inches; stamens $1\frac{1}{2}$ inch shorter than the perianth; anthers above 1 inch long, brown with red-brown pollen, like those of *L. Brownii*; filaments straight, the same colour as the perianth; style curved, the stigma overtopping the anthers. *J. G. Baker.*

NOTES FROM UPLEATHAM.

The cultivation of hard-wooded stove and greenhouse plants up to a size that will admit of their competing successfully at leading exhibitions, is a

perly treated, over the greater portion of the year. Plenty of heat, with a liberal diet in the shape of manure-water afforded almost constantly, is required by these plants whilst growing, and they are scarcely ever allowed to rest. Insects must also be kept down in numbers.

Amongst *Allamandas*, there are specimens of *A. nobilis* and *A. grandiflora*, quite 5 feet in diameter; and *Dipladenias* are represented by fine specimens of *D. amabilis*, *D. Brearleyana*, *D. boliviensis*, and a seedling variety, *D. Thomas Speed*, which is said to be larger in the flowers and deeper-coloured than *D. amabilis*, with the still further merit of retaining its flowers so as to have more of them open at one time on the trusses than is the case with other varieties.

Quite apart from the importance which *Ixoras*, *Dipladenias*, and *Allamandas* hold on the exhibition stage, they are equally indispensable where cut flowers are largely in demand; for not only are they

variety, about $2\frac{1}{2}$ feet through, is unusually strong. In *Crotons*, there are large examples of *C. Queen Victoria*, *C. Johannis*, and *C. angustifolius*, each 6 or 7 feet through, pictures of health and fine colour. Amongst the newer sorts was observed a beautiful example of *C. Thomsonii*, one of the best and highest-coloured varieties.

In the conservatory were some grand Palms and Tree Ferns. Of the former, *Corypha australis* is 15 feet in diameter; *Chamaerops humilis*, 10 feet high, with a beautiful head of healthy leaves; several large *Kentias*, including *K. Belmoreana*, 18 feet high, and proportionate in the spread of its leaves; *Dicksonia squarrosa* has a stem 10 feet high, with a splendidly-furnished head; *D. antarctica*, somewhat less in height, but in fine condition; *Cibotium regale* is 16 feet in the spread of its fronds; *Neottopteris australasica* and *Lomaria zamiaefolia* are both large, and in fine condition; *Davallia fijiensis plumosa* measures 7 feet across; *Pteris acaberula*

and *Leucostegia immersa* are only a little less. *Davallia tenuifolia Veitchiana* is 5 feet through. This is one of the most beautiful species that has ever been introduced; its delicate arched fronds give the plant a peculiar elegance different from all other Ferns. *Gleichenias* are well managed; the kinds grown are *G. Mendelii*, *G. rupestris glaucescens*, *G. spelunca*, and *G. dicarpa longipinnata*. Several of these are 6 or 7 feet through. Amongst greenhouse plants I noticed a good example of *Chilma's* variety of *Aphelaxis macrantha rosea*, a scarce plant, and the best of all the *Aphelaxis*, *A. macrantha purpurea*, *Boronia elatior*, *Darwinia tulipifera*, *Epacris miniata*, *Statiche profusa*, *Leschenaultia biloba*, *Lapageria alba*, and *L. rosea*, with others of like character, varying in size from half to full-sized specimens. There is a nice selection of the best species and varieties of *Ericas*, of which may be mentioned *E. ampullacea*, *E. amula*, *E. Marnockiana*, *E. Cavendishiana*, *E. ventricosa Bothwelliana*, *E. Irbyana*, *E. Fairrieana*, *E. Austiniana*, *E. Turnbullii*, *E. Massoni major*, *E. gemmifera*, *E. elegans*, and *E. depressa*, ranging in size from 3 to 4½ feet in diameter, all in a healthy, thriving state. *T. B.*

ORCHID NOTES AND GLEANINGS.

VANDA HOOKERI AND ODONTOGLOSSUM CORONARIUM.

The rare and beautiful *Vanda Hookeri* was recently flowering freely in the collection of C. W. Lea, Esq., Parkfield, Worcester, in several examples, some of which flowered last May. These plants are grouped in one of the Orchid-houses, and form a rare and beautiful sight, with about two dozen expanded flowers. In the same collection, two well-grown plants of the rare and beautiful *Odontoglossum coronarium* were showing flowers, one having two, and the other three fine spikes. To have flowered this species so well is a credit to Mr. Catt, the Orchid-grower at Parkfield. *A. O.*

CATLEYA LABIATA VAR. AUTUMNALIS *alias* WAROCQUEANA.

This beautiful variety is now in bloom in great profusion in the collection of E. Moon, Esq., Cassio-bridge, Watford. A marked feature in these flowers is the brighter tint of the sepals and petals than is found in most of the other forms of *C. labiata*. The different plants display great variation in growth and flower; one has flowers with blush-white sepals and petals, and a rich velvety-crimson lip; and several are of very dark and rich colours, one especially being superior to any of those forms which have been distinguished by varietal names, and figured in various periodicals.

LEMNA PRESTANS.

A fine compact mass of this handsome dwarf-growing Orchid is suspended in an Orchid-house at Cassio-bridge; it is a grand example of what a good form of this species may become. The plant has thirteen flowers, of about 4 inches across, and of fine form. The colour of the front of the lip, which is broadly developed, is of a rich crimson, and the fact of this plant always sending out several spikes, which bear three flowers each, proves that it is different from the ordinary form of *L. prestans*.

DENDROBIUM AINSWORTHII ×, *Lindenia*, t. 297.

A hybrid between *D. aureum* and *D. nobile*. Flowers white, lip with a purple throat. The plant was raised as long ago as 1867, but did not flower till 1874.

CATASCTUM BARDATUM, *Lindenia*, t. 298.

LELIO-CATLEYA AINOUDIANA ×, *Lindenia*, t. 299.

A hybrid raised by Messrs. Sander between *L. purpurata* fertilised with the pollen of one of the varieties of *Cattleya labiata*. The seed was sown in 1881. Flowers large; sepals and petals pale rose-coloured, lip deep rose, with a yellow blotch in the throat.

RHYNCHOSTYLIS CÆLESTIS, *Lindenia*, t. 300.

The habits of this plant are like those of a *Saccolabium*; the racemes erect, many-flowered; the flowers white, with the front part of the lip deep violet. It is a native of the Malay Archipelago.

CATLEYA LABIATA AND VAR. WAROCQUEANA.

In my former article, at p. 367, I alluded to the type-plant of *Cattleya labiata* var. *Warocqueana* in the Kew collection, which produced a three-flowered raceme in May, 1890, as promising to flower during the present autumn. A few days ago the sheath burst, showing an inflorescence of four flowers, which have just expanded, and prove to be identical with others which have flowered elsewhere, both in this and the previous autumns, though they are a little paler than some forms I have seen. This proves unmistakably that the plant flowering in May was abnormal, it being influenced by the unfavourable conditions under which the plant was placed in transit, and that autumn is its normal season to flower. There can be no possible doubt on this point, for this is the very plant from which the description was originally prepared, though I had also wild dried flowers and coloured drawings, which showed a rather unusual range of variation, and these, of course, were also utilised. The few other plants which flowered in May last year, I am told, have also failed to do so in the present one, but have fallen into line with the others on becoming established. There can be now no doubt that the name *Warocqueana* will have to be cancelled. *R. A. Rolfe.*

JERUSALEM ARTICHOKE.

At this season of the year, with the return to our tables of this valuable esculent, we are reminded of the somewhat singular statements of Canon Ellacombe, under the above heading, in the columns of the *Gardeners' Chronicle*, p. 151 of the issue dated so far back as January 31, 1891, and express our surprise that they should have so long passed without challenge or comment:—"That the Italian *Girasole* is the *Ricinus* or *Palme Christi*, and the Italians had, in the seventeenth century, a plant called *Girasole*, but it was a very different plant from the *Jerusalem Artichoke*." When we couple these remarks with those from the same gentleman (October 6, 1882), "I have never been able to find with certainty that the plant ever was called *Girasole*," we have the key to his remarks, that he has settled the question of nomenclature. Before proceeding to comment upon the Canon's observations, we should like to put the matter of nomenclature before the public, so far as we understand it.

The controversy which has arisen at various times as to the name *Jerusalem Artichoke*, has been caused through a mistaken idea that its original country was Italy, whereas its native country is either Peru or Topinambour, a district in Brazil, and the name is evidently a corruption of its Brazilian name, "*Girasole tuberoso*." Nearly a decade ago (1882), the same gentleman took exception to some remarks in the Editor's leader in the *Gardeners' Chronicle* (October 21, 1882), that "the *Jerusalem Artichoke* had nothing to do with *Jerusalem* or *Artichokes*," which he said was true of the thing, but not of the name, and our ancestors were not likely to take the Italian name, and then immediately corrupt it; further, he had never been able to find with certainty that the plant had ever been called "*Gira sole*." Thereupon ensued a discussion for a few weeks, and the subject dropped, left as ambiguous as ever.

During that discussion, Mr. H. J. Ross stated the Italian name of this plant as "*Tartufi-bianchi*," an appellation also given to the *Piemonte Truffa*. Mr. C. Wolley Dod introduced the *Custard Marrow* into the discussion under the French name of "*Artichaut de Jerusalem*." Canon Ellacombe ended the discussion by asking for evidence of the introduction of the *Jerusalem Artichoke* by way of Italy, or for proof of the name *Girasole* in any

Italian work published prior to 1617; a proceeding quite on a par with bringing into the discussion a similar French name as applied to another vegetable, the plant under discussion coming from America under the Spanish name of *Girasole*, nothing could satisfactorily be proved by Italian books. However, according to Canon Ellacombe, we have now a settlement of the question, an Italian posthumous translation of *Matthioli* and also *Dalechamps' Histoire Générale*, have been referred to, and discussion of the derivation of the name having now been set at rest, the perseverance of the Canon has raised ignorance from despair and established happiness in the paths of science! On carefully perusing the extract from the books already mentioned, we find that in Tuscany *Ricinus* is called *Girasole* and also *Faguolo*, and in Lombardy *Mirasole*; so far *Matthioli's* translator.

Then, *Dalechamp* informs his readers that *Palma Christi* is called by the Italians *Girasole*. By the way, it may be here remarked that the Italians at the present time also use the name "*Fagiolo*" for several species of *Phaseolus* and *Dolichos* as well as *Palma Christi*, but now spelled differently, not *Faguolo*, but *Fagiolo*. Then the writer sums up:—"The Italians had in the seventeenth century a plant called *Girasole*, but it was a very different plant from the *Jerusalem Artichoke*." Perhaps there is no need of apology on my part to ask permission to remark that a very pertinent question has arisen to my mind—was it necessary to search the tomes of these ancient learned men—*Matthioli*, who died in 1577, and *Dalechamp* in 1597—for proof of the well-known fact that *Ricinus communis* is not *Helianthus tuberosus*? To quote an analogy, is it necessary to consult *Theophrastus* to find out the fact that his *Sykomorus* is a different plant from the *Sycamore* grown in Britain? or *Holy Writ*, for the inference that *Amos*, a scratcher of *Wild Figs*, could not use his handicraft upon our *Sycamore*?

To return to our subject. Perhaps, if *Matthioli* had been further consulted, *Palma Christi* would have been found also to be an *Orchis*,* and he could have thrown no light upon the *Jerusalem Artichoke* question, as he probably never knew it. About the time *Dalechamp* was writing his book, the *Jerusalem Artichoke* was known in Italy as *Flos solis Farnesianus*, said to have been introduced from the West Indies; and we also read that about that period it was called *Aster peruvianus tuberosus*, which throws some inference upon its American habitat having originally been more southerly than might be inferred from its Italian name of "*Girasole del Canada*." Whilst another, also Italian, name of "*Girasole Topinambour*," localises it to a district in Brazil called *Topinambour*.

Filippo Re, in *L'Ortolano*, ii., p. 222, informs his readers: "*Girasole*. Il cui nome secondo il puro linguaggio toscano è *Clizia* Appartiene al genere *Helianthus* di *Linneo*, classe xix., ord. iii." And also in vol. i., p. 87, we find "*Girasole. Helianthus annuus*, Significa ancora *Ricino*. *Girasole del Canada* vedi *Topinambour*." And in vol. ii., p. 385: "*Topinambour*. Poir de terre, Fr. Appartiene al genere *Helianthus* di *Linneo*, *Helianthus tuberosus*," &c. Again, *Filippo Re* in *Il Giardinere*, vol. ii., p. 170, "*Helianthus tuberosus Girasole topinambour*."

In *Evelyn's Acetaria*, p. 75, we have also the information that the *Sunflower* "ere it commenced to expand and show its golden face, was dressed as the *Artichoke*, and eaten for a dainty;" but this, even in *Evelyn's* time, he tells us, "had abdicated to foreign countries;" so that *Girasole Artichokes* might have been applied to other members of the *Helianthus* family, as well as, and even prior to, *H. tuberosus*.

Parkinson tells us (A.D. 1625), the history of *Batatas* of *Canada*, and their introduction into England was from *Canada*.

In 1592, *Fabius Columna* calls it *Aster peruvianus tuberosus* and *Flos solis Farnesianus*, having observed it growing in the garden belonging to

* *Orchis conopsea*. Spr. *Palma Christi*, *Matth. Valgr.* 1585 tom ii., p. 935.

Cardinal Farnesius, who had introduced it from the West Indies.

Johnson, in Gerard's *Herbal*, ed. 1633, says:—"One may well perceive by the English name of this plant that those that vulgarly give names to plants have little either judgment or knowledge of them; for this plant hath no similitude in leaf-stalk, root, or manner of growing, with an Artichoke, but only a little likeness of taste in the dressed root; neither came it from Jerusalem or out of Asia, but out of America."

In conclusion, we may ask the question, are there not plenty of anomalies in the horticultural world without adding more? *Stachys tuberifera* is to be called the Chinese Artichoke, and it is not necessary to remark, that it is not an Artichoke, nor has it an origin or anything to do with China. "They are neither of Chinese origin, nor are they Artichokes." [This is partly erroneous. The plant is a native of Northern China as well as of Japan. Ed.] *Hm. Eberington Dixon, Assoc. Bot. Soc., Edinburgh.*

FOREIGN CORRESPONDENCE.

COLOMBIA.

On coming overland from Popayán to this place (Medellin), I made an expedition to a district which I am sure has never been visited before by any botanists, nor perhaps by any other scientist. Judging from the errors made about this district in the best maps of Colombia, not even the "Comision Corografica de Colombia," to which the late Señor José Triana belonged, can have been there. I refer to a series of rather confusing lateral spurs from the western Cordillera, on the borders of the States of Cauca and Antioquia. From a horticultural point of view, my last excursion might be considered of little importance, for no grand new *Cattleya* or fine new variety of *Odontoglossum* was detected; but from a scientific point of view the result was highly important.

Besides a fair number of new and very interesting species of various orders of plants, with which my herbarium has been enriched, I enlarged my knowledge with a great many facts as to the geography of the country, the geographical distribution of species, and the causes upon which their presence or disappearance depends, &c. I can give only a few instances. Some few years back I was amazed to find *Odontoglossum vexillarium*, Rehb. f., in the districts of the Upper Amazonas, far down in the Eastern Andes of South-Eastern Ecuador, a plant always believed to be restricted to a small area of North-Western Colombia, and although the flowers are not much larger than those of a large-sized Pansy, and very dark-coloured, they offer absolutely no reliable structural characters for the creation of a new species. In a similar manner, I was surprised during this last excursion. Commencing at an elevation of from 2800 to 3400 metres on the high Cordilleras of the northern parts of the Province of Loja, in Southern Ecuador, and extending northward through the whole of Ecuador and Southern Colombia as far as the Páramo de Guanacas, near Popayán. I was always of opinion that at this latter locality the beautiful and brightly-coloured *Oncidium Jamesoni*, Lindl., reached its northern limit. Here, again, several hundred miles further to the north, on the western mountains of Antioquia, I found the plant, and just as typical as the most typical specimen from the slopes of the Pichincha volcano, or the Pululagua, near Quito. This gives a distance, in a direction from north to south, of over 700 miles for the two species mentioned. Many similar instances were observed, but the two alluded to should suffice to suggest a warning to modern species-makers in dealing with plants originating from different localities. The time has gone by when, by such characters as the presence of a few warts in one flower, whose presence in another was overlooked, a *Masdevallia acrochordonia* could be separated from *M. Ephippium*; or when, by half a dozen latin words, often of obscure meaning, a new species was supposed to be described.

Neither time nor health permit me to give here an exhaustive description of the country and its physical conditions. I reserve this for another occasion. To-day I limit myself to the notices of a few new acquisitions among Orchids.

TWO NEW CORYANTHES.

The first of these is a second member of a new group of this genus, with stiff upright flower-spikes—if we accept Dr. Lindley's statement that "all *Coryanthes* necessarily possess pendulous flower-spikes." The first, *Coryanthes Wolfii*, named by me in honour of Professor Dr. Wolf, formerly of Guayaquil, now of Dresden. Dr. Wolf will shortly favour the world with a reliable map of the physical phenomena of Ecuador. In his house I had the pleasure of seeing, examining, and sketching the first flowers of this marvellous plant, although it was known to me many years previously as an Ecuadorean species. It grows very sparingly, mostly on Cacao trees, all over the littoral districts of the Guayas, where it flowers in February and March, when these level lands are mostly inundated. During this season, it is beyond the power of man to penetrate the woods there—a circumstance that accounts for the plant not having been seen before. It produces thick upright flower-spikes 40 to 50 cm. high, with three to six large wonderfully-constructed flowers, which are yellow, mottled, and stained with brownish-red.

The second species, *Coryanthes Mastersiana*, which I dedicate to Dr. Maxwell T. Masters, is of Colombian origin, where it grows on trees or woody lianes, not far above the ground, in dense and exuberantly-developed woods at the lower extremity of the valley of the Cauca at an elevation from 800 to 1100 metres. The plants are large, and very floriferous. The bulbs are subcylindric or narrow-oblong, bent, deeply plaited, from 8 to 12 cm. long, two-leaved. Leaves from 30 to 50 cm. long, 4 to 6 cm. broad, oblong, acuminate, plaited. The flower-spike from 40 to 60 cm. high, stiff, upright, two to three flowered (as far as observed up to now), clothed with three to four membranous, obtuse spatheaceous bracts; those surrounding the base of the ovaries 3 cm. long, 1 cm. broad, cucullate sharp-pointed. Sepals membranous, the dorsal one ovate-acuminate, not much longer than the column; the lateral ones angulate, wing-shaped, cuspidate, 9 to 10 cm. long, 4 to 5 cm. wide, reflexed. Petals oblong-ligulate, blunt-pointed, slightly undulated, 2.5 to 3 cm. long. The lip, connected with the column by a short thin arm at a right angle, consists of a thick, deep, bell-shaped hypochil, which is 2.5 cm. in diameter, 2 cm. deep, and with a smooth limb; a thick fleshy, cymbiform gibbose mesochil, which, on its outside, bears three large tooth-shaped callosities, of which the lower one is the largest, and hidden in the hood of the hypochil; and a large bell-shaped epichil, which has a two-lobed margin, and a fleshy deep tridentate apex. The column is 3 cm. long, bent back at a right angle near the apex, thus forming a broad, breast-like, slightly-keeled projection, on either side of which runs a narrow membranous wing. The border of the anther-bed runs up on the side of the stigmatic cavity in two sharp-pointed strongly bent horns. On either side, at the base of the column, is a long fleshy semicircular arm, which stands in a horizontal ring-like manner over the isthmus of the lip. The colour cannot be given with certainty, as the only flowers found were already slightly faded; it appears to be yellow, stained with red, the hypochil of the lip deep glowing red.

Complete botanical material of both *Coryanthes Wolfii* and *C. Mastersiana* will be deposited next year in the herbarium of the British Museum, South Kensington. A few living plants have been sent to the Liverpool Horticultural Company at Garston, near Liverpool.

There are but few plants in the entire vegetable kingdom which are more interesting, and which afford such a varied amount of material for the student of vegetable physiology. Everything relating to *Coryanthes* is curious, and arrests the attention of the observer, even its spontaneous mode

of growth. Wherever a larger mass is found in the tropical forests of South America, numerous ants surround its root-masses. This ant is a small-bodied species of *Myrmica*, possessed of a strong aromatic smell, and which bites very severely, so that it requires some courage to meddle with the plant. These ants seem to be indispensable to the well-being of the plant, for if these animals do not collect around the roots, it appears not to do well. Even in a cultivated state, as well as in the house of my friend, Dr. Wolf, at Guaysquil, as in my own country residence, I have observed the same facts. But nothing surpasses the flowers. The very peculiar organisation of the whole flower, the position each organ assumes in relation to another the secretion of a sweetish fluid always retained in great quantity in the bucket, all is highly interesting, and invites both to study and investigation.

Several other new Orchids of interest were discovered on this expedition, but I must reserve the notice of them for some other occasion. I will only mention here a *Pescatorea* with fine large flowers; but, alas! a very unpleasant smell. The intensity of the latter suggested in the first instance the name of Mephisto. It is the first member of this sub-genus of *Zygopetalum* that has this peculiarity. All the others have either fine fragrant flowers, or they are scentless. The present species is also interesting on account of its growth in an inter-Andean locality the first instance known to me. *F. C. Lehmann, Popayán.*

THE POISON OAKS.

In your issue of September 12, a correspondent asks about *Rhus toxicodendron*. The plant is native here, and is found in great abundance on the edges of most of our native woodland. Many people are poisoned, not only by handling it, but by its exhalations, some persons being much more sensitive to the poison than others, as some can handle it with impunity. The point I wish to make is, how to be sure you are dealing with the right plant. So far as I know, no poison Vine in this country has a leaf that is more than three-parted; all four-parted or five-parted seem to be harmless. We have four or five varieties of the *Rhus* family, and I believe only two are poisonous; and these two have three-parted leaves. Here they are known as "poison Ivy," "poison Oak," "poison Sumac," "poison Vine," &c. The *Rhus toxicodendron* is the most virulent. The disease it causes is erysipelas pure and simple, and should be treated as such. A common and very efficient remedy when the poison is first seen on the skin, is a strong lather of common potash soap, made strong and applied with a shaving brush, layer on layer until the part affected is thoroughly coated. Keep the air out with that, and keep the coating moist, and in twenty-four hours, as a rule, the trouble will disappear. *D. O. C., Chicago, U.S.A.*

THE CULTURE OF ALPINE PLANTS.

(Continued from p. 455.)

Is a book which I am studying, and which may well be recommended to all who grow alpine plants, Herr Max Kolb, the Director of the Botanical Garden at Munich, writes thus:—"It has been proved that the greater number of Primulas bloom better when not exposed to full sun." And a little lower down in the same page, he writes:—"They should face due east, so that the first rays of the sun may fall upon them, and the plants be protected towards midday by some kind of alpine shrub." I submit that stone pockets do away with the necessity for alpine shrubs, and are, indeed, far better for the purpose in view; and I think I am in line with Herr Kolb's injunctions about this matter.

Nor are these pockets of use merely for the protection which they afford from the sun. Plants love to nestle against a stone, to press it hard, and to grow as close to it as it is possible for them to do. I have in my mind's eye now, two or three not very difficult alpine, such as *Saxifraga sancta*, *S. diapen-*

sioides, *S. Burseriana*, and *S. casia major*, which are as happy with me as though they were inhabiting some rocky summit; but in every instance that I speak of, they have been placed in an angle between two stones, and are pressing it hard. They will do elsewhere, it is quite true, but they will not do nearly as well as in a position of this sort, so far as my experience goes. This kind of drawing towards a shelter is by no means peculiar to alpine plants. How often a monthly Rose will hold on in October and November when it finds itself under the cover of a broad and far-reaching eave, or it may be in a recess which two walls of a house at right angles to each other afford! But this simple observation governs the construction of the whole of my rockery. The pockets do give the shelter which plants love so much, and this is all that is asked for. But let me say, it is by no means all that is given. If the above consideration stood alone, it would settle the matter in my eyes; but it does not stand alone. Mr. Boyd said the other day, "I am quite sure that this is the right way for growing alpine plants;" and one reason which he gave for it was the following:—"You cannot water

walls of the pockets, and are proof against the utmost raging of the wind. Let it be remembered before all this is vetoed, and put out of court, that for the most part, we have the pleasure of seeing alpine plants in their own native habitats during the bright season of the year, but it is ever the case that they are left naked and exposed to the keen wintry blasts? Are they not rather most affectionately and carefully covered up? What a deep mantle of snow does so effectually for long months together, my little bit of glass aims at, and also succeeds, more or less in providing—and this is only what Nature would dictate.

Mr. Alfred Bennett has explicitly written, in the four-volume work which he has edited on alpine plants:—"Since we have not in this climate the thick covering of snow which in the higher mountains remains without interruption till late in the spring, this must be replaced by an artificial protection." I do not know what he recommends as being the best expedient for the purpose, but he certainly has arrived at a conclusion which is very much the same as that on which I think so much insistence should be made. I believe, that so far from alpine—I mean, the more trying and difficult sorts—being insensible to cold, they feel it in the highest degree.

To give only one instance in point, which occurs to me on the moment:—I took a glass off *Potentilla nitida atropurpurea* too soon, which had been covered during the winter, and which was doing quite well; an unexpected sharp frost came on the very next night, and it was immediately destroyed. Doubtless it might not have been so sensitive to cold if it had never been covered at all, and very likely a *Potentilla* of this sort would have stood the winter without any protection whatever; but it had enjoyed its shelter for weeks, and the loss of it meant destruction at once. It should also be remembered that it is quite one thing for a little flower to pull through a trying season of frost, and it is another thing for it to do the same thing with ease, and not to have suffered at all. It is this last condition which alpine plants like best by a long way, and which, therefore, I aim at for them.

Let it be remembered that Messrs. Backhouse, who must know a very great deal about this sort of thing, habitually keep a large portion of their stock in frames during the winter months, and it is not exposed to the cold. My glasses are like movable frames, which can be taken away in the spring. *H. E., Ryde.*

(To be continued.)

THE EFFECTS OF GIRDLING A BRANCH OF A FRUIT TREE.

Our illustrations (figs. 63, 61, and 65), show the effect of girdling a part of a tree so that its downward growth and development are checked, and an accumulation of food formed above the tie. The case in question occurred in the garden of Philip Crowley, Esq., a branch of a Jefferson Plum was accidentally girdled in this way, with the result that the fruits produced from the portion above the constriction were very much larger than others on the same tree. Ringing and girdling are very old cultural practices, alluded to in recent times by Mr. Rivers and other cultivators, but withal rarely practised.

THE BRITISH FRUIT GROWERS' ASSOCIATION.

*Gathering, Packing, and Marketing Fruit.**—We are all familiar with the usual instruction in cookery books on how to cook a hare, viz., "First catch your hare," which, if not the most important point, is certainly one indispensable; but having accomplished this, it is desirable to know how to cook it properly and well.

* A paper read by Mr. G. Hammond at the third Conference of the present season, which was held in the Garden Hall, Crystal Palace, Sydenham, on Friday, September 4.

So, perhaps, some will say concerning the subject of this paper, "We want you to tell us how to grow a crop of fruit; anybody can gather it when it is grown." Stay, ye critics, I am not so sure of that. Nay, I go further, and say I am quite sure that comparatively few people know how to gather and pack fruit properly. In a few words, therefore, I will endeavour to tell first how it should not be done, and then also how it should be done.

Perhaps the way which gives least trouble (and this is the way lazy folks look out for) is, to let the fruit hang until ripe (and then to climb the tree, if a large one), and give the branches a good shaking, when nothing will be needed but to pick up the fruit from the ground. Some may feel inclined to laugh at the mention of such a method, but I knew of a case in which this method was adopted with small dessert Pears, ripe and juicy, and from a high tree, with what results I leave you to guess. This is one way of how not to do it. Another way in which it should not be done is suggested by a common expression of "pulling" the fruit, which always seems to me to suggest much too rough usage, both for the fruit to be gathered and for the tree from which it is to be taken. Anyone who has had experience in this matter knows that if you take hold of any kind of fruit, and pull it off anyhow, that you break

FIG. 63. JEFFERSON PLUM, FROM ABOVE THE CONSTRICTED BRANCH SHOWN IN FIG. 65.

them properly when they are placed on an incline—the water runs off from the rocks." I think this is true, though it had not occurred to me before he so explicitly said it; and I may also add two other benefits which these nearly level pockets afford. I have the strongest belief in a small piece of glass being put over the head of an alpine plant, or at all events of some alpine plants during the winter months. I know that this is an expedient which is very often mocked at by alpine climbers, and also by gardeners. They think it means coddling—it must be uncongential to a plant which has been blown upon by all the winds of heaven, and which has for months looked upwards to the bright blue sky! But is not this going rather too fast, and begging the whole question that is at issue? What alpine plants love dearly is a very equable temperature—great stretches of the same amount of warmth and cold, and what they hate is a drizzle over their heads one day, a bright sun the next, a sharp frost immediately afterwards, and then a glow which seems to say to them, alas! how often is it said too soon, all trouble is over! And I do not know how to "steady" my favourites, those, I mean, about which there is real cause to be anxious—so well, or half so well, as by letting a small bit of glass remain over their heads with the sides open during the trying portion of the year. This can easily be managed in more ways than one; I have wires, which are most effective, and which are bent so ingeniously as to have a good grip of the glass, and also the little panes (which I have cut to measure by the hundred, in London) will lie quite securely against the

FIG. 61. JEFFERSON PLUM, BELOW THE CONSTRICTED BRANCH SHOWN IN FIG. 65.

some part of the tree with almost every fruit. On examination of a fruit tree it will be observed, that clustered round the present fruit-stalks are numerous fruit-buds, which are next season's fruit in embryo. Now, if by carelessness or ignorance these be destroyed, it is evident that not only has the present crop of fruit been pulled, but with it also a large part of next year's crop as well.

Then, again, when the fruit has been gathered from the tree, it is often allowed to fall from the hand into the basket, thereby causing it to be bruised and unsightly, and of course, to some extent, unsaleable, or at least it looks like what a friend of mine calls "tumble-down Pippins." This should not, and need not, be. As a general principle I may say: Always turn the fruit upwards, putting the thumb against the base of the stalk, when (if the fruit be ready) it will part readily from the tree without breaking a single spur or fruit-bud. This applies especially to Apples and Pears; with Plums it will be generally found that the fruit parts more easily from the stalk than the stalk from the tree, and it is as well in ordinary picking that it should be so, as less damage is done to the tree thereby. Care should be taken in picking Plums not to destroy the beautiful bloom which most kinds have upon them; they should never be touched by hand except to pick them from the tree.

For large trees, I think nothing has yet surpassed the ordinary fruit-gathering ladder—i.e., wide at the bottom, and the usual kind of basket, somewhat smaller at the bottom than the top, with a cross handle and hook attached. For low trees, a pair of steps will be found of very great service. In all cases the ladder should be set as nearly upright as possible, so as to press lightly against the tree, and

keep the basket close to the picker, so that the hand may easily reach the bottom of the basket. The fruit should never be dropped into nor rolled about in the basket, or it will speedily show signs of rough usage. When it is intended to send the fruit direct to market, place it at once into the market sieves from the picker's basket.

Notwithstanding many suggested improvements during the last few years, I think there is nothing so suitable for general use as the ordinary market baskets known as bushels, half-sieves, flats, half-flats, and pecks. These all allow the escape of heat, which is one of the greatest enemies of fruit after it has been gathered. Place the fruit into these carefully, and in doing so it should be properly sorted into large and small, or best and seconds, and of one quality throughout, not small at the bottom and large at the top, which in the end means loss. All packages should have a sheet of paper (blue tissue is generally used) over the top, and may be covered with Fern or straw in any way most convenient, and is then ready to be despatched to the market or elsewhere. In the matter of packing

I need not say much upon the marketing of fruit, but a few hints may be useful. As most of the fruit grown is consigned to salesmen, I would say: Try and discover someone who bears the character of honest dealing, and trust him. Do not dodge about from one to another, which often has led to getting "out of the frying-pan into the fire." Let the fruit be honestly packed, giving good measure, and customers soon discover this, and inquire for the goods, with the result that full market price is obtained with little difficulty. I find it to be a good plan, as a rule, to have a continuous supply of the same kind of fruit. In sending, say, 100 bushels of Apples of one kind to market, I would not send them all at once; but commence, say, with 15 to 20 bushels, increasing the quantity as the customers seemed to appreciate them. On the other hand, do not send a small quantity of a large number of sorts, which is very bewildering to the salesman, who finds such consignments a great nuisance.

Lastly, let all fruit be in marketable condition when sent, or it will probably be left for days or weeks before finding a purchaser, and then only at a

FIG. 65.—GIRDLED BRANCH OF JEFFERSON PLUM, SHOWING THE EFFECT OF CONSTRICTION (SEE FIGS. 63 AND 64).

fruit we have much to learn from our neighbours across the channel, who do more in grading the fruit and putting it into small baskets or boxes than we do. As a rule, it may be said that the smaller the packages into which the best fruits are placed, the better, especially in a scarce season.

As to the time of picking, everything depends upon what is intended to be done with the fruit when gathered. If it is to be sent direct to market, in the case of Apples they may be gathered as soon as they have attained a saleable size, and will part fairly easily from the tree; but if they are to be stored for winter use, they must be allowed to hang until fully developed, and, if possible, until they are well ripened, and the pips turned brown. Fruit to be stored should only be picked when quite dry, and must also be handled with great care; but if for immediate use, it is not necessary to be quite so particular. Plums for ordinary kitchen use, may be gathered when only slightly coloured and still hard, but if of the best dessert kinds, they must be allowed to ripen first. Most Pears require to be kept for a time after being gathered, to become ripe and fit for use. Care must be taken not to gather too early, which causes them to shrivel; nor to let them hang so long as to have most of the crop blown down by a moderate wind,

low price, alike unsatisfactory to the salesman and the grower. I have this year seen Damsons upon the market while still quite green, and absolutely unsaleable. How can salesmen be reasonably expected to give satisfaction under such circumstances? One great advantage of the fruit from abroad is this—"that when placed upon the market it is fit for immediate use," which seems to suit the circumstances of most buyers, who say, "We do not want fruit to keep, we want it to sell." We must, therefore, try and supply not only the article they want, but supply it also in the condition in which they require it.

FLORISTS' FLOWERS.

CHANGEABLENESS IN THE CHRYSANTHEMUM.

In his interesting and instructive *Short History of the Chrysanthemum*, Mr. C. Harman Payne has a chapter on sports, and he there informs us that from what can be learned, "nearly all the early imported varieties from China were much more inclined to sport than the majority of those raised from seed; the old purple, the expanded light purple, the quilled

light purple, the curled lilac, and the buff seem to have been those most sportive in the olden time." He tells us that the first sport noticed and fixed in this country originated from the old purple, the plant first introduced in 1790, in the garden of the Bishop of London at Fulham. Cuttings were at once taken of the sport, which was called *The Changeable White*; in very rare cases something more than a change of colour occurs, there is a change of shape, and this characteristic is maintained when the sport is propagated.

The cause of sportiveness in some flowers is one of those secrets the vegetable kingdom keeps in a large measure to itself: it is hidden away in the silent mystery of the flower's nature. Mr. Gordon, when superintendent of the ornamental department in the Horticultural Society's Garden at Chiswick, made a statement to the effect that "the mutability of colours in the *Chrysanthemum* flower is of old date, and was observed to occur many years ago, when it was, no doubt, more common than it is now, and probably was owing to some differences caused by the change of climate on the plants being first introduced, for the more common cases happened in plants first propagated from the original stock shortly after they were imported from China." This was written half a century ago, and had Mr. Gordon been living in our day, and could have witnessed the frequent occurrence of sports from seedling plants, and also from varieties that were obtained as sports from others, he would doubtless have modified his opinion. Mr. Sabine, in a paper read before the Horticultural Society of London so far back as 1820, stated that "the old changeable white, or Lee's white, as it was sometimes called, was obtained from a sport of the old quilled purple, and that the variations in its colours were great. Sometimes the florets were pure white, especially in cold seasons; sometimes the backs of the inner florets and the whole of the outer ones were pale purple. Sometimes each floret was striped white and purple, and on which account it has been called the *magpie Chrysanthemum*; while, in a warm situation, and in a fine autumn, the centre florets would become purple, and the outer ones white—and at other times, though but rarely, one side of the whole flower would be purple, and the remainder white—and in a very warm season the flowers would become entirely deep purple like the original." Probably some of these changes were not really sports, but simply changes caused through the varying age of the flower. It is well known that remarkable changes occur, and not infrequently a flower of a well-known variety is sent as representing a sport from it, whereas it is simply a matter of development and age.

Queen of England, a popular incurved flower sent out by John Salter in 1847, has proved most prolific of sports. I think I am correct in stating, that it has thrown at least six, *viz.*, *Alfred Salter*, *Empress of India*, *Emily Dale*, *Golden Queen of England*, *Bronze Queen*, and *John Doughty*. *Emily Dale*, and *Golden Queen of England*, if not quite the same in general characteristics, come so near to each other, that it is not expedient to exhibit both in the same stand; and *John Lambert* is of much the same character, and is a sport from *Lord Alcester*, which in its turn originated as a sport from *Empress of India*, a white sport from the rosy-blush *Queen of England*; so in addition to the sports which broke direct from it, some of these have sported in their turn. *John Doughty* is considered the best of this colour. *Alfred Salter* stands alone, and has not, so far as I am aware, sported in its turn. In addition to *Lord Alcester*, *Empress of India* threw another sport, known as *Golden Empress*. *Bronze Queen of England* and *John Doughty* also approach very near to each other, and cannot safely be exhibited on the same stand.

Next to *Queen of England*, the variety most prolific of sports appears to be *Princess of Wales*, a rosy-blush incurved variety, which has been in cultivation nearly thirty years. Its first sport was *Mrs. Heale* a white variety—this occurred in 1867; then, in 1888,

Miss Violet Tomlin occurred, a deservedly favourite variety, of a bright violet-purple colour when caught at its best, but becoming paler with age. The following year appeared Mrs. S. Coleman, bright rose, shaded with yellow in the centre, and like the foregoing, a flower of fine quality when in good condition; Mrs. Heale has sported in its turn. Princess of Teck appears also to have thrown three sports, viz., Hero of Stoke Newington, rosy-pink; Lord Eversley, pure white; and about the same time, Mrs. Norman Davis, rich golden-yellow, sometimes shaded with bronze in the centre.

(Of our leading incurved *Chrysanthemums*, something like thirty have originated as sports, and among them we find not a few of the most popular exhibition varieties. *R. D.*)

CYCLAMENS AT ISLEWORTH.

Cyclamen, that is *Cyclamen persicum* and its innumerable varieties, are now beginning to lend a cheerful aspect to the shelves and stages of the cool greenhouse, by means of their large and attractive flowers, the colour of which varies from the purest white to the deepest purple. In the nursery of Mr. J. Taylor, Twickenham Road, Isleworth, a few thousands of plants are grown, and present ample evidence of successful cultivation, if one may judge by the sturdy habit of the plants, their fine foliage, and large blooms. The seeds are sown at different periods, so as to ensure a succession of flowers during the winter months. At the present time even, arrangements are being made in regard to next season. Numerous seedlings are being shifted from the store pots into tubs, from which in due course, they will again be removed into larger pots according to their vigour, and will be ready to produce flowers early next season. As a rule, old corms are not kept, it being found that the best blooms are generally to be obtained from the young ones. Mr. Taylor's houses are low, and although somewhat detrimental to the headgear of a tall visitor, are well adapted for the culture of *Cyclamen*, inasmuch as the plants being tolerably near to the glass, are enabled to obtain an abundance of light, which is most beneficial to them. Owing to the very wet season of this year, the only danger to be apprehended is damping, but this may in a measure be successfully overcome by giving plenty of air (without causing draughts) from the top and side lights. *Mitza.*

PLANT NOTES.

NEW HYBRIDS OF STREPTOCARPUS.

The new race of hybrids of *Streptocarpus*, which originated at Kew, and have been hybridised and selected by Messrs. Veitch, will probably become as popular as the Chinese *Primula*. They are easily grown, and succeed well in an intermediate-house, greenhouse, or conservatory. Seed sown in February or March will produce plants which will flower with ordinary culture from July to November. From a packet of seed sown in March, I have had a fine lot of bloom since the end of August, and to all appearance the plants will go on flowering till November. There are many shades of colour, ranging from pure white, with purple and blue stripes in the throat, to pale lilac, deep lilac, lavender, mauve, violet, and rosy-purple. The first year the plants usually show from two to five blooms on a stem, and from fifteen to twenty-five spikes, and as the plants get older and stronger the flowers are much more freely produced, fifty to seventy flowers in various stages of development being of frequent occurrence on a single plant.

Now that the *Streptocarpus* has been taken in hand, we may expect before long to have the most telling colours for decoration in separate strains, as in the case of the Chinese *Primula*. A good bright crimson would be an acquisition. White, blue, purple, and crimson *Streptocarpus* will be a boon to gardeners for the decoration of the conservatory or greenhouse during the dull months of September and October, and the Messrs. Veitch are to be congratulated on introducing to the gardening world such a useful decorative race of plants as the new hybrids of *Streptocarpus* originated by Mr. Watson. "*Sans Peur.*"

THE BULB GARDEN.

NARCISSUS ITALICUS.

The bulbs of *Narcissus italicus*, flowers of which I send for your inspection, came here from Italy three years ago, and have been grown in the open border (south), in front of a plant-stove. Last year it bloomed here (Trinity College, Dublin) for the first time on October 10, only bearing one scape; but this year there are several other scapes to follow. It is very like *N. papyraceus* or "Paper-white," but as you will see, the cup is pale primrose-yellow, and not pure-white. We have a very similar plant from Hyères, but it will not bloom until November or December in the same position.

We have now here a collection of wild collected *Narcissi*, which will flower from this date until the middle of June, or a period of at least eight months of the year.

N. italicus is a variable variety, but these early-blooming forms would prove preferable to "Double Roman" and "Paper-white," whenever early flowers of *Narcissi* are desired. *F. W. Burbidge, October 5.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

THE CATTLEYA-HOUSE.—*Cattleya Bowringiana*, a beautiful Orchid, is now opening its first flowers. It is a plant that is free in growth and very floriferous, and may be grown either in a basket or pot in a compost consisting of three parts brown fibrous peat and one of sphagnum moss. When growing, the plant requires to be kept rather moist, and at all times in rather more heat than most other *Cattleyas* need. *Laelia Perrinii*, now in flower, is a very beautiful Orchid for the autumn. As this species of *Laelia* displays so many varieties of comparative worthlessness from a gardener's point of view, the present is a good time at which to select plants from the growers. The typical *C. Hardyana*, truly a very fine *Cattleya*, is also in flower, as it is regularly with us at this season. The true autumn-flowering *C. labiata* and *C. Warocqueana* are flowering side by side here, and the flowers of the latter have the flower segments rather narrow, thus differing in those respects from *C. labiata*. It is, however, a very useful addition to the autumn-flowering *Cattleyas*, and seems to be a plant very easy to cultivate. Great care must now be taken in damping the *Cattleya*-house, the lack of sunshine during the summer and autumn having left the growths soft and immature, and a gentle warmth in the hotwater pipes, and as free a circulation of air as can be afforded with safety, will assist to ripen the growths. "Spot," which at one time was found more or less prevalent in collections, has now almost disappeared, and some plants, which were considered "miffy" then, are now grown without trouble. This change for the better has been brought about by freer ventilation, and by that alone. It is a penny wise and pound foolish policy to shut up the house close merely to save fuel, although there are times when it becomes necessary to shut up all the ventilators—when fumigating, for instance, but they should be opened as soon as the smoke has dispersed. If this is done, the objectionable smell of tobacco-smoke in the house is avoided.

Oncoglossum coronarium is now in flower, and of our two plants one has three and the other two spikes of flowers. These plants are grown in peat and sphagnum moss in boat-shaped baskets, and for the last four years they have been hung up close to the roof in the Masdevallia-house. Has any reader ever seen more than three spikes on any one plant of *O. coronarium*? We bloom every year *O. brevifolium* and *O. chiriguense* under the same conditions. I should perhaps mention that these plants have never been allowed to become dry at the root. *A. G. Catt, Parkfield, Worcester.*

THE FLOWER GARDEN.

PREPARING THE GROUND, AND PLANTING ROSES.—The Rose, as of yore, retains her own in public

esteem against all new comers, as with each succeeding year additional interest is evinced in its culture, and fresh recruits admitted to her ranks.

SOIL AND SITUATION.—The soil most suitable for Rose-growing is a rich deep loam, inclining to be heavy, and resting on gravel, and if the situation slope to the south-east or south-west all the better. Should the natural soil be of a light description, some clay should be well mixed with it. On the other hand, should it be unduly stiff leaf-soil, then road-sand, coal-ashes, burnt earth, and manure should be incorporated whilst trenching it. I may remark that good wheat-land will produce good Roses—their cultural requirements being attended to.

PLANTING.—Although Roses may be planted any time from the beginning of November to the end of February (weather permitting), the sooner the work is done in November the better. If the Roses are to be planted in rows by the sides of walks, holes about 18 inches deep and wide should be dug out, putting if necessary a layer a few inches deep of hard materials as drainage. If the excavated soil is unsuitable, replace it with a compost consisting of three-parts good loam, and one of rotted manure. This being well mixed, plant the Rose bushes, trees, or standards, in the centre of each hole, and at about the same depth in the soil as they stood before, treading the soil well about them. Cut off in planting any damaged or unduly long roots with a knife, and this done, put a stout stake at the further side of each plant for its support, securing them with tarred string, and afterwards laying over the roots a thin mulch of half-rotted manure. Choose a fine day for planting, and rather than plant when the ground is very wet, lay in the plant, and wait for fine weather. Roses growing in beds, as well as those freshly planted therein, should now have a surface-dressing of manure.

ROSES ON THEIR OWN ROOTS.—For planting in beds, I prefer plants on their own roots, giving them a space of from 3 to 4 feet between good strong plants, pegging the shoots out over the beds the end of the following March, or early in April, according as the season and situation are early or late. Thus treated, the shoots send out flower-bearing growths nearly over their entire length, and the suckers, which annually push from the roots, are duly pegged down between the older shoots, which ultimately, *i.e.*, when the allotted space has been properly covered, they will replace, the old growths being cut out each year as soon as the bloom is over. In this way, fresh vigour, and consequential floriferousness, and long life are yearly imparted to the plants.

VARIETIES.—Although the varieties of the Rose are legion, new ones crop up from time to time to swell the already long list, however, the following brief selections include some of the best of the respective kinds, and may be increased or decreased according to circumstances. [A list of varieties will be given in our next. Ed.] *H. W. Ward, Longford Castle, Salisbury.*

THE HARDY FRUIT GARDEN.

TREE-LIFTING AND ROOT-PRUNING—These operations, so essential to success in fruit-growing, should now be commenced, and continued during fine weather until stopped by frost. Peaches and Nectarines are trees usually taken first, and in their case, lifting is preferable to merely cutting back the stronger roots. In doing it, dig out a deep trench at 4 to 6 feet from the stem, according to the stretch of the branches, and then, with a digging-fork, loosen the soil from the roots, preserving all of them as far as possible; and after this is done, and the tree is lifted bodily, make the drainage good, and refill the holes with a partly fresh compost, consisting of fresh loam if procurable, burnt earth, old mortar, and a small quantity of crushed bones, and make it firm by treading before replanting. The roots—that is, the strongest and longest—should be shortened a little, and badly-bruised roots cut off above the injured part, and all of them spread out at various depths, and covered up with the compost. Some temporary loose fastenings will be required to keep the branches in place; and over the roots place a mulch of stable-dung several inches thick.

APRICOTS growing with too much vigour may be lifted and replanted like the first-named fruits, but giving them rather more depth of soil, and plenty of lime rubble. Manure is not needed, except where the soil is of poor quality, when a mild kind, like a Mushroom-bed, or old-root-bed materials, may be made use of.

PEARS AND APPLES.—Root-pruning, if needed by any of the trees, may be undertaken as soon as the fruit is gathered, and in the case of large old trees, it should be done in part—only at one time. All descending roots must be severed or bent upwards, for if any of these are left untouched, the work will be spoiled. Make use of some fresh soil, and make firm by treading. If this operation is carried out with thoroughness, finer and better-coloured fruit will result. All fruits, with the exception of the latest ripening Pears, should now be stored. Fruit trees required to form a reserve, or for filling walls and fences, should be ordered from the nursery. If the trees should arrive with the roots much dried, steep them overhead in water for a few hours, and lay them in on single lines in wet soil, if they must be left unplanted for a time. *H. Markham, Mercworth Castle, Maidstone.*

THE KITCHEN GARDEN.

FRENCH BEANS.—Those in pots and frames now coming into bloom should have a rather higher temperature afforded them, and all the sowings for succession now standing in cool frames should be removed to heated pits or houses, and placed near the glass. A temperature of 65° at night should be maintained and afforded when the weather is mild, but carefully avoiding cold draughts. Occasional syringings both before and after flowering will tend to keep them clean, and doses of warm liquid manure should be afforded to encourage growth, but only when the soil has got filled with roots.

RHUBARB.—The leaves remain long on these plants this year, and in taking up roots for forcing, none with unripened crowns should be chosen. It will assist them if a trench be cut round the stools; and these be taken up ten days afterwards. Place the roots close together on a hot bed of tree-leaves, filling in between them with light soil or leaf-mould, and syringe the bed daily with tepid water. By maintaining a bottom-heat of 70° to 75°, and an atmospheric warmth of 55°, Rhubarb may be well grown in an ordinary cellar, but it cannot be forced in such places. Rhubarb should be lifted at intervals of three or four weeks, so as to maintain a regular supply of the vegetable, the roots being laid aside in a dry cool place for a period of ten days before being put into the forcing-house.

ASPARAGUS.—The beds should be hand-weeded, and all the stems of Asparagus with seeds on them removed from the beds before the seeds fall, otherwise much trouble will be incurred next year in destroying the seedlings. Asparagus roots may now be lifted and forced, and of all kinds of forced vegetables, this one is the most accommodating. A good way of forcing it is to make a mild hotbed of stable litter and fresh tree leaves, of sufficient size to receive a two or three-light frame, the bed being made 3 feet longer and wider than the frame that will be put on it. Put the material firmly together, so as to secure a lasting and regular warmth, and prevent unequal subsidence of the frame. If the warmth is likely to exceed 80°, a layer of turves should first be placed over the materials, and then a layer of mould and leaf-soil, mixed, about 4 inches thick. Lift the plants with all the soil that will adhere to them, when the bed is quite ready for them, and plant without exposing the roots to the damp influences of the air. Place them close together on the bed, and fill the spaces with light soil, covering the crowns 6 inches deep. Forced Asparagus is most liked when it is green, as when bleached it is stringy, and but little of it is eatable. As soon as the shoots push forth, afford all the light possible, and a fair amount of air when the weather is mild.

GENERAL WORK.—remove the remains of crops, and mix them with lime, soil, and garden rubbish. Turn manure heaps, and manure vacant quarters needing it, and get them ready for digging or trenching. Ground turned up at this season of the year is best left in a rough state, and stiff soils should be ridged when digging them. Remove dead leaves from Brussels Sprouts, Broccoli, &c. *C. J. Waite, Glenhurst, Esher.*

FRUITS UNDER GLASS.

EARLY VINES.—The wood of all Vines should now be thoroughly ripe, if forcing is to commence next month; and not only should the shoots be mature, but the foliage decaying or falling. As previously advised, pot Vines should now be in the

open air, at the foot of a sunny wall, the canes being fastened to prevent their twisting. The earliest of the planted-out Vines should be pruned without delay, the loose parts of the bark removed (not scraped with a knife), and dressed with some kind of mixture to destroy insects. Vines in pots, &c., should have the loose soil removed, refilling the space with a rich compost. Let the drainage be well looked to, giving more space for the roots to go through into the plunging materials. The borders in the early vinery should be similarly top-dressed with loam which has been thrown up, with layers of manure at every 6 inches; some bone-meal or Thomson's Vine Manure may also be added to the loam. Young Vines which have been grown in pots for planting or to be cut back next season may be placed against a sunny wall to ripen, if required early next season, some spent Mushroom-bed manure being spread over the roots; or they may be plunged in stable litter. Before starting any Vines in pots, thoroughly cleanse the house in which they are to grow, and, if it can be done, paint the woodwork, than which nothing is better for the destruction of mealy-bug, &c. Materials in which to plunge the pots should be placed in a heap, and turned over frequently till it is in a sweet condition for use.

SUCCESSION-HOUSES, as fast as they are cleared, should be abundantly ventilated night and day; and if doubts exist as to the ripeness of the wood, artificial warmth may be applied. Shorten the shoots of the Vines if they are crowded, and if the borders are unfortunately outside, get them covered with materials which will exclude snow and rain. Vines whose roots are in a bad condition may be lifted, finishing the job this month, for I do not advise the lifting of Vines later than October. In houses where fruit is hanging, much attention will be necessary from this date, going over all the bunches at least once a week, and removing decaying berries, remembering that one bad berry will contaminate three or four others in its neighbourhood. Fire-heat must always be used in small amounts in the day-time to keep damp in check; freely airing the vinery in fine weather. Houses in which Grapes must hang some time longer should not have plants in pots put in them, and everything that breeds dampness should be kept at a distance. Cover the borders to throw off moisture—we use corrugated zinc for the purpose—it is light and easily transported. First we give a thick covering of dry leaves, and then put the zinc cover on the top of the leaves. Care is taken to give the covering a sharp slope to the front of the border. It is well at this date to allow free circulation of air under the covering. *G. Wythes, Sun House, Brentford.*

THE APIARY.

PREPARATIONS FOR WINTER.—Colder weather, with frosts, will soon be upon us, and nothing that requires attention in the apiary should be deferred. Any requeening that may be necessary must be done before the close of the month. Queens will not be obtainable after that time, as owing to their liability to get chilled, they cannot be sent by means of the post with safety. Feeding should have been completed some time ago, but if this has been neglected, it is essential, if syrup is used, that it should be given at once at a temperature of about 100°, and as rapidly as possible. Stocks that are only a few pounds short, it will be better to provide with candy, which can be run into cardboard or wooden boxes to any required weight. It is not a bad plan to place about a pound of candy over the feed-hole of every stock, even if they have sufficient stores, for as soon as the bees take it, they provide themselves with winter passages. Any uniting that is necessary should be done now, and it is better to dust each lot with flour beforehand than to sprinkle with scented syrup. Hive-roofs should be looked to, and any that require making water-tight should be puttied up and painted whilst the weather is still favourable. Quilts, in the shape of several thicknesses of woollen carpet or flannel, must be provided for covering each stock, and if American-cloth comes next the frames, the entrance should be left open all the winter to the extent of 6 inches at least, unless an air-space is provided beneath the frames, when it may be almost closed. If porous quilts are used, the entrance may be contracted to half an inch. Care must be taken to prevent mice from obtaining ingress, as many a stock has been lost from this cause when it has been least suspected. Winter passages can be provided by laying two pieces of wood, about half-an-inch in diameter, on the tops of the frames, underneath the quilt; or a

piece of stout Bamboo, cut in halves, would answer the purpose perhaps better, placed hollow-side down.

FOUL BROOD.—Naphthaline and Naphthol Beta being now the accepted remedies for this disease, it is advisable to use one or both preparations as a preventive in districts where it is known to exist. Pieces of the former, about the size of a nut, can be slipped between the combs, so that they drop on to the floor-board there, taking several weeks to evaporate, whilst the latter is used in place of the old remedy—salicylic acid—for medicating syrup or candy. It requires to be dissolved in alcohol before it is used. Both the remedies can be obtained at a cheap rate, and of the proper strength, with full directions for use, at the office of the *British Bee Journal, Expert.*

PLANTS AND THEIR CULTURE.

THE PLANT STOVES.—The temperature of the warm-r houses will now require to be lowered, and for the present the warmth may range from 65° to 70° at night, rising 10° on cloudy days, and to 85° with sun-heat. Let all the ventilators be closed early in the afternoon, damping at the time of shutting up, the walls, stages, and paths. Shading of all kinds may now for the future be dispensed with, a fine dry day being chosen to take them down. Any inmates of the warm house which may have been employed for furnishing other structures, will be the better for being brought into their winter quarters. The present is a suitable time for the re-arranging of the plants in the stove, clearing the glass of con-ferva and dust, so that there will be no avoidable loss of light during winter, and when re-arranging the plants, care should be taken to place each subject in the position most suitable for it, at the same time having an eye to effect.

FERNS: THEIR TREATMENT DURING THE WINTER.—Those beautiful and interesting plants, the filmy Ferns, delight in a comparatively cool and shady situation, and the case or frame in which they are grown should be placed where there are no cold draughts, and where the sun's rays do not reach them. In such positions, the temperature is usually of a uniform character, both in summer and winter, which is one of the secrets of their successful cultivation. During winter, special attention is needed in the matter of atmospheric moisture, so that no excess in this respect shall occur. Excessive moisture at this season is provocative of the growth of a species of mould fungus, which is very destructive to the plants.

The general collections of Ferns will have completed their growth, and the temperature of the Ferneries should be lowered. The greenhouse kinds, as *Adiantum Williamsii*, *gracillimum*, *assimile*, *cristatum*—the last-named is a crested form of *A. assimile*, and has a very graceful appearance—*Asplenium falcatum*, and *Doodia aspera multifida*, the last is destined to become a great favourite with gardeners, on account of its dwarf habit, nicely arched fronds, the young ones pink tinted; these will winter best in a temperature of 45° or 50° by night. No higher temperature should be afforded greenhouse Ferns, as it has a weakening effect on them, and in some cases encourage the spread of insects.

The warm house or stove species of Ferns should be kept in a temperature from 55° to 60° during the winter, and during severe frost it will be advisable to allow the temperature to fall 5° lower, and make use of a covering over the roof rather than keep the hot-water pipes very hot during the night. The Ferns will require much less water at the roots from now onwards, but care must be taken not to let them get so dry as to cause injury. Atmospheric moisture must also be lessened. In many gardens no structure is entirely devoted to the stove species, and the plants must be grown with the rest of the stove plants, and where the temperature has to be kept rather too high for them. Where such arrangements exist, it is advisable to place the Ferns at the cooler part of the stove.

Cheilanthes chlorophylla, *C. hirta* *Ellisiana*, and *Gymnogramma elegantissima* are very useful plants, and admirably adapted for decorative purposes, hanging in baskets, &c. *Microlepia hirta cristata* and *Pteris aspericaulis* should be kept in the dryer part of the house, as both are impatient of damp. Any Ferns infested with scale or thrips should be cleaned. The fronds being now in a hard state, are not readily injured by the use of insecticides. All kinds of fertilisers should now be dispensed with. *R. Milner, Penrice Castle, Swansea.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, Oct. 27. Royal Horticultural Society, all Committees; and Lecture by H. Veitch, Esq., on "Autumn Tints."

SALES.

MONDAY, Oct. 26. Dutch Bulbs at Protheroe & Morris' Rooms
Nursery Stock at Thomson's Nursery, Wimbledon, by Protheroe & Morris (2 days)
Nursery Stock at Plaistow, Essex, by Protheroe & Morris
Dutch Bulbs at Stevens' Rooms

TUESDAY, Oct. 27. Great clearance of Fruit Trees, Roses, &c. at the American Nurseries, Leytonstone, by Protheroe & Morris
Dutch Bulbs at Protheroe & Morris' Rooms
Clearance of Nursery Stock at the Mile Ash Nurseries, Derby, by Protheroe & Morris
Dutch Bulbs at Stevens' Rooms

WEDNESDAY, Oct. 28. Great clearance of Nursery Stock at Churchfield Nursery, Chesham, by Protheroe & Morris (2 days)
Clearance of the First portion of Nursery Stock at the Sea View Nurseries, Havant, by Protheroe & Morris (2 days)
Plants and Bulbs at Protheroe & Morris' Rooms
Orchids of Mr. C. Van Trop at East Dulwich by Protheroe & Morris
Dutch Bulbs at Stevens' Rooms

THURSDAY, Oct. 29. Dutch Bulbs at Protheroe & Morris' Rooms

FRIDAY, Oct. 30. Orchids at Protheroe & Morris' Rooms
Clearance of Nursery Stock at Bantstead by Protheroe & Morris

SATURDAY, Oct. 31. Dutch Bulbs at Protheroe & Morris' Rooms
Dutch Bulbs at Stevens' Rooms

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—47°.

ONE circumstance that depresses the soul of the journalist arises from the fact, that however fully he may record the results of experiments, however much he may, as he thinks, offer demonstrative proof, even from his own experience, of the desirability of making further trials of this or that procedure, little heed is paid to his admonitions by his readers. We cannot say this of the experiments carried out on so large a scale by Messrs. SUTTON in the case of the employment of sulphate of copper as a remedy against the Potato disease. We have recorded from time to time, and given pictorial illustrations showing in brief the results obtained in France, and the Royal Agricultural Society has called the attention of its members to the desirability of instituting experiments for themselves. Acting on this suggestion, Messrs. SUTTON have instituted, on a scale few persons could emulate, a trial, the results of which, on account of its magnitude, we are bound to give

respectful attention, if not unconditional acceptance. Messrs. SUTTON recently invited a number of representative cultivators and publicists to view the results of their experiments, and this is what they told them:—

"As we annually plant, for trial, many hundreds of samples taken from the bulks with which we deal during the season, as well as new seedlings not in commerce, we this year decided to divide each trial into two equal portions, dressing one-half with the 'Bouillie Bordelaise,' and leaving the other half undressed. The plots, or trials, thus brought under treatment reached a total of 810, of which 278 were separate varieties.

"In the annexed table will be found a complete list of the weights of each half-row, dressed and undressed, showing the loss, or gain, after treatment, and the total loss, or gain, of each separate variety. These results speak for themselves.

"A brief glance at the table, however, will show that in the case of all the earlier sorts of Potatos, which had matured their crop before the disease set in, there is a very decided loss resulting from the dressing. As the first dressing of the 'Bouillie Bordelaise' was applied on June 27, when these Potatos were in vigorous growth, this unsatisfactory result would seem to indicate that the Bouillie is not of any avail as a fertiliser, whatever the effect of the applications might have been in preventing the disease had it appeared as early as is sometimes the case.

"The instances where the dressing seems to have produced the greatest benefit are on such varieties as 'Regents,' 'Victoria,' 'Woodstock Kidney,' and a few others, which are known to be so liable to disease as to be seldom planted.

"It is satisfactory to find, that in the new group of disease-resisting Potatos, represented by 'Sutton's Magnum Bonum,' and 'Sutton's Abundance,' the expense and trouble involved in the application of the dressing is not warranted by the results obtained. Out of 34 rows of 'Magnum Bonum' only 2 showed any gain, 3 were unaffected, whilst 29 were injured by the dressing; the result of the 34 trials showing a total weight of 5 cwt. 2 qr. 24 lb. for the dressed rows, and 7 cwt. 1 qr. 25 lb. for the undressed rows, a difference in favour of the latter of 1 cwt. 3 qr. 1 lb.; 35 rows of 'Abundance' showed a total weight of 8 cwt. 1 qr. 4 lb. for the dressed rows, and 9 cwt. 1 qr. 22 lb. for the undressed rows, a difference in favour of the latter of 1 cwt. 0 qr. 18 lb."

The tables presented in confirmation of Messrs. SUTTON's statements are much too bulky for us to reprint, but we may give the summary as follows:—

	Tons.	cwt.	qr.	lb.
810 rows undressed	5	8	2	5
810 rows dressed... ..	4	17	1	1
Total increase in undressed	0	11	1	1

Now this result of itself is what might have been anticipated. No one supposes the copper sulphate or the copper oxide as it becomes when mixed with the lime to be a fertiliser. It is far more likely to be a caustic. That it should act as a check to vegetation is, therefore, just what one would expect. The real question is, whether the advantages which accrue from the prevention or from the destruction of the fungus mould outweigh the loss which may be expected to result from the application of such a substance as copper oxide to the foliage. The practical man will further ask whether, assuming, as is alleged, that the sulphate is a fungus poisoner, the game is worth the candle; will the results, from a commercial point of view, justify the cost? To this latter question the summary table above given affords for the present a decisive answer. The result of Messrs. SUTTON's experiments, as far as they are narrated, is decidedly adverse to the use of the copper salt.

Messrs. SUTTON have so well earned the thanks of the Potato-growing and Potato-consuming

community, that we can only express our gratitude for the pains they have taken in the matter. As specially familiar with the many circumstances which go to modify any general conclusion, Messrs. SUTTON will, however, we are sure, not demur to the statement that their results, valuable as they are, are by no means conclusive. The tables give us no record of the total weight of produce, and, although it is true the tables say "sound Potatos only," we have no guarantee as to what were sound and what were unsound; nothing beyond assertion from general inspection, only what actual percentage of diseased tubers to the whole really was. In experiments of such a large character, general inspection has to take the place of the more exact information that more accurate scrutiny would afford. This is one of the many cases where the so-called "flower-pot" experiments are more trustworthy than those conducted on a larger scale. In all probability, there was much more disease than appeared on the surface. What Messrs. SUTTON's tables show is, the fact that sulphate or oxide of copper acts as a check to the growth of the haulm; and this is what, if we did not know it before, we might have fully anticipated. We do not see that Messrs. SUTTON's tables bring out, as we hoped they might have done, the precise effect upon the fungus. As it is, the diminution of the crop, as recorded, may be partly attributable to the copper, partly to the effect of the fungus. It must also be noted that Messrs. SUTTON's experiments do not agree as to their results with those of Messrs. R. VEITCH, of Exeter, mention of which is made at p. 490. Sorts, soils, dates of application and other factors must all influence the results, in connection with which circumstances we may mention an interesting observation made by Mr. BARRON at Chiswick. Of two adjoining pieces of ground devoted to the growth of Potatos this season, one was tilled and ridged in the ordinary way, so that it was exposed to the action of the winter's frost, and was friable and workable accordingly; the other from force of circumstances, was left unworked. Both plots when the time came were planted with Potatos of the same variety. When the disease came, it overwhelmed those which were growing on the unworked soil, whilst it was so much less destructive on the same variety growing on the tilled soil that the crop is reported as heavy and sound. We have much to learn yet.

At last we have the very great satisfaction to note a general movement towards that extension of horticultural education, for which we have so often, and for so many years pleaded. Now that the tide has begun to flow, it seems as if it would set in with great force. All the more necessary, therefore, is it that it shall be, as far as possible, controlled and directed into right channels. We are inundated with notes and schemes and reports on the subject, for which even if it were desirable we could not find room, but we may say in general terms that the line of advance seems to be three-fold. There is the elementary education in the rudiments, and which is controlled by the Education Department; there is the system of practical demonstration for the benefit of existing cultivators, and there are the projects, some of which are already in action, to furnish more or less complete schools of horticulture and agriculture. It is evident that all three classes must be worked on a practical as well as on a scientific

Copper Salts and Fungous Mould.

Horticultural Education.

basis, and that to do good they must grow according to the progress of evolution, from small beginnings. They cannot be started at once as complete and faultless schemes of operation, but they must be possessed of such vitality as to be able to bend to circumstances, and be capable of adaptation to the requirements of the case as they present themselves. For our own parts, we look with greater confidence to benefit arising from the education of the coming generation than to attempts to instruct the present race of cottagers and labourers, or even the higher grades for whom horticultural colleges are destined. To effect the most good, we must begin at the very beginning with the alphabet of principles, and the most elementary of practical operations. How much

culture, insects, and fungi, and other general matters. It is especially intended that both principles and operations should be practically demonstrated at every step so far as possible, and in some cases it is thought that, for a suitable fee, qualified gardeners in the various districts would occasionally undertake this task. Where convenient or desirable, the pupils in the third stage could themselves perform the simpler work, under the direction of the teacher, who in the two earlier stages had acted merely as a demonstrator. We cannot find room in this issue for the details of this scheme, but we hope to do so on a future occasion.

The system of education which seems to be preferred by the County Councils is the telling-off competent lecturers to visit the rural dis-

holding of good systems of cultivation and by their denouncement of bad ones. Great advantage will also arise from the practical demonstration of good methods of pruning, or other operations, and by the bringing home to the mind of the cultivator that, as a rule, it is as easy to grow good (that is, suitable) sorts as bad ones—a lesson which greatly needs enforcing.

Turning to the third mode of improving horticulture, we must allude in passing to the horticultural colleges for the education of a higher class of pupils, and for the training of teachers—a most important function. We need say nothing at present of the very few existing institutions in this country, and we designedly omit mention of the strictly agricultural colleges, but we may point to the

FIG. 66.—THE PARTERRE: MISSOURI SCHOOL OF HORTICULTURE AT ST. LOUIS. (SEE P. 489.)

may not be learned, say, from the growth of Mustard and Cress, in which children delight? In this simple operation there is abundant scope for the clever teacher to drive fast home elementary principles and correct practice.

The British Fruit-growers' Association has prepared a scheme for use in country schools, which has been favourably received by the Education Department. The scheme takes the form of a three years' course, the first stage to be devoted to an elucidation of the principles of plant-life, not only on a botanical basis, but in strict application to cultural requirements. The second stage deals with the elementary operations of gardening, including the description and use of the implements required. The third stage is simply an extension of the second, giving fuller details of the respective operations, and referring briefly to fruit, vegetable, and flower

trials, and to demonstrate matters of primary importance to the cultivator. Thus, Mr. BLANDFORD is lecturing on Entomology at the request of the Kent County Council. Mr. GRANT, Mr. FISH, Mr. WRIGHT, Mr. CASTLE, and others, are admirably qualified to instruct in this practical manner; but, knowing what we do of the average cultivator, we are not very sanguine as to his ability to fully profit by the instruction he will receive. Stolid indifference, scepticism, prejudice are formidable antagonists, and, speaking generally, they are not to be removed from the mind of an adult labourer by lectures, however excellent. It is by beginning with the child, and making his receptive mind grasp principles, that the best chance of future progress is afforded. Nevertheless, no doubt some present good will be done by lecturers and demonstrators of the class we have mentioned, by their constant up-

horticultural and technical schools of Belgium, France, Germany, and the United States, as furnishing models for imitation here. Among the American schools is one in connection with the botanical garden of St. Louis, founded by the late Mr. HENRY SHAW, and now under the direction of Professor TRELEASE. This Institution comprises, in addition to library and a laboratory, an extensive garden, in which garden scholarships have been founded, to which garden pupils have access on special terms, and in which, while the principles are duly enforced in the lecture-room, practical work is carried out systematically and unflinchingly in the garden during a term of six years, the garden pupils in the earlier part of their career having to work nine or ten hours daily in the practical work of the garden. The illustrations we give in the present issue will show

that our statement that the new Missouri Botanical is well equipped for the purpose in view.

We must not overlook either the great number of agricultural stations in Germany and the United States, and even in our colonies, as at the Cape and in Australia, which are the means of diffusing an amount of information which have hitherto been mostly denied to Englishmen at home. Still, we are now not quite destitute of resources of this nature in this country, and a movement is afloat to provide our fellow countrymen with the means of obtaining high-class technical education as good as can be had in Belgium or the United States. A joint committee of the Worshipful Company of Gardeners and of the Royal Horticultural Society is formulating a scheme, of which we subjoin the outline, premising that the scheme in question is still under discussion, and that is mentioned here, not as final, but for the purpose of showing that the Royal Horticultural Society is not behindhand in the consideration of this educational question. The propositions recently agreed to in principle are the following:—

"Name.—The British School of Gardening and Agriculture (?).

"General Objects.—To impart a higher class of education in the principles and practice of fruit, flower, vegetable and tree cultivation than is at present attainable in Great Britain, to (a), Persons wishing to qualify themselves for employment in gardening and garden-farming in this country, (b), Persons who may be desirous to emigrate, or may be already resident in the Colonies.

"It is sought to Educate.—The sons of landed proprietors, farmers, or any others who are interested in gardening and garden-farming, whether born in Great Britain or the Colonies; preference being given to British-born subjects.

"Admission of Students.—No student shall be admitted who does not already possess some practical knowledge or experience of gardening or garden-farming; all students being expected to continue their studies for two years, under ordinary circumstances.

"Employment of Students.—The object being to impart a thoroughly practical education, all students must be prepared to devote themselves to the manual, as well as to the scientific branches of the work.

"Teachers.—Efficient Directors will superintend the instruction in the various branches of cultivation; and lectures, illustrated by practical demonstrations, will be delivered by qualified persons on the scientific aspects of gardening and garden-farming. To attain the object in view, it is proposed that the Worshipful Company of Gardeners, in conjunction with the Royal Horticultural Society of England, secure suitable land within an easy distance of London, where experimental and practical gardening and garden-farming may be carried on, pending which arrangements are being made to utilise the Gardens of the Royal Horticultural Society at Chiswick for the instruction of students in connection with this scheme."

We shall revert to these several means for the advancement of horticulture on another occasion.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Floral, Orchid, and Fruit Committees will be held in the Drill Hall on Tuesday, October 27, when the Society holds its usual display of new and rare plants, &c., and at which special prizes will be offered for cooking and dessert Apples and Pears, as well as for varieties of Grapes. Intending competitors should at once communicate the nature of their intending exhibits to the Superintendent, Royal Horticultural Society's Gardens, Chiswick. In the afternoon, at 3 o'clock, Mr. HARRY J. VEITCH, F.L.S., will read a paper on "Autumn Tints." Specimens of trees, shrubs, or

other plants, or shoots and foliage, will be welcome as illustrations.

THE CONIFER CONFERENCE.—Among the exhibits of living specimens at Chiswick the week before last, some further mention than the mere record of a Vote of Thanks should have been made of the exhibit shown by Messrs. LITTLE & BALLANTYNE, of Carlisle. Those gentlemen showed an interesting collection of some eighty species and varieties, which were not only characteristic, but interesting, as showing what can be grown in the extreme north-western corner of England. The enterprise manifested in the despatch of so large a consignment from so great a distance is particularly noteworthy.

"BOTANICAL MAGAZINE."—The October number contains coloured figures of the following plants:—

Yucca filifera, t. 7197, described as by far the finest of the filiferous Yuccas. A native of North-east Mexico. Professor SARGENT, in *Garden and Forest*, says of it, that its great panicles of white flowers can be seen for miles in the clear atmosphere, and look like gleaming waterfalls pouring out from the ends of the branches. Kew.

Cirrhopetalum Colletti, t. 7198.—A very remarkable species from the Shan States. The flowers are large (in the genus), orange coloured; the dorsal sepal ovate, with a long deeply-fringed terminal appendage, the fringe being of a deep red colour, and very mobile; lateral sepals deflexed linear-lanceolate acuminate, about 4 inches long. The side petals have a terminal appendage like that of the dorsal sepal, but less deeply divided. Kew.

Napoleona Miersii, t. 7199.—A very curious West African shrub, confused with *N. Whitfieldii*, but distinguished, according to Sir JOSEPH HOOKER, by the pale membranous obovate leaves, with faint sunken nerves, and the smaller number of teeth to the corolla, and other points. Kew.

Euryphia Billardieri var. *Millynyi*, t. 7200.—A species like *E. pinnatifolia*, but with entire linear-oblong leaves, and much smaller flowers. It seems uncertain to what order this curious genus should be referred. It has, in fact, no near relatives, and, considering that it is confined to Chili and Australia, it may be regarded as a survival of vegetation different from that now existing, but which flourished when there was direct land communication between Temperate Austral and South America.

Epiphyllum Gaertneri, t. 7201.—A species confused with *E. Russellianum*, but differing in its much larger, broader, and thicker crenulate articulations. The flowers are more brilliantly coloured, with narrower petals and terete (not winged) calyx-tube, and the long spreading stigmas. Kew.

CATTELEYA LABIATA VAR. AUTUMNALIS.—M. LINDEN, of L'Horticulture Internationale, Parc Leopold, Brussels, announces his intention of selling at Messrs. PROTHOR & MORRIS' Auction Rooms, Cheapside, on Friday, October 30, about 200 plants in flower of *Cattleya labiata* var. *autumnalis*. The event should be of much interest to cultivators and collectors of Orchids, affording, as it does, a favourable opportunity of observing the merits or otherwise of different varieties there exhibited in flower.

THE POTATO DISEASE.—In several quarters the question has been asked, whether salts of copper applied to the foliage would leave traces in the tubers in sufficient strength to prove dangerous or unwholesome for table use. This has long since been proved in the negative sense in France, and Messrs. ROBERT VEITCH & SON, of Exeter, whose experiments with the formula given in our columns were most successful, have gone into the matter, and report favourably on the protective influence of the copper. They sent to Mr. BERNARD DYER, the Analyst for the Devon County Agricultural Society two samples of the tubers—one a sample of Potato whose haulm had been dressed with the solution of copper and lime, and the other undressed. They send us Mr. DYER'S report, which we give below,

and which must be regarded as a satisfactory answer to the question raised:—

[COPY.]

"Laboratory, 17, Great Power Street, E.C.

"October 17, 1891.

"Messrs. ROBERT VEITCH & SON, Exeter.

"DEAR SIRS,—I have carefully tested the Potatoes you sent me, for copper. Practically speaking, they are free from copper—that is to say, there is less than 100th of a grain of copper in 1 lb. of the Potatoes. Since I find practically the same quantity in both sets of Potatoes, viz., both in the dressed and in the undressed ones, it appears clear that the small trace that is to be detected must be regarded as normal to Potatoes grown in this field, and not as due to the dressing. But even if it were, the quantity is to be regarded as infinitesimal.

"Yours faithfully (Signed) "BERNARD DYER."

L'ORCHIDÉENNE.—The Brussels Society of amateur orchidists known as the Orchidéenne, held their thirtieth meeting on October 11, in the winter garden of L'Horticulture Internationale. The exhibition was a success in every way, especially so, considering the lateness of the season. In addition to the exhibits enumerated below, the many visitors much admired the fine series of varieties of *Cattleya Warocqueana* (*C. labiata autumnalis*), which clearly demonstrated the excellence of this magnificent species, of which so much is now thought. Among the principal Orchids staged, we must specially mention the following:—The splendid *Cattleya Warocqueana*, *C. maxima* var. *Malonana*, a unique specimen; *Cypripedium Stonei*, *C. Harrisianum*, full of bloom; *C. tonsum*, and *Haynaldianum*; and *Oncidium varicosum* Rogersi, bearing a long raceme of brightly-coloured flowers, sent by M. G. Warocqué. The new *Angraecum du Bayssoni*, a most interesting species, with sweetly-scented blossoms; and the charming *Laelia* × *exoniensis*, from Madame E. Gibeze. Two plants of *Cattleya aurea* of superior height and colour, and *C. aurea* var. *Lansbergeana*, from M. J. De Lansberge. Splendid specimen of *Cypripedium Rothschildianum*, bearing four most beautiful flowers, from M. Dallemagne. The curious and elegant *Briopsis rutidobulbon* and *Cypripedium Roebelinii*, both covered with bloom; *Oncidium splendens* and *Dendrobium Phalaenopsis*, with flowers of a warm shade of reddish-violet, from M. Van Imshoot. A species of *Odontoglossum*, from M. F. Kegeljun. A fine example of *Cattleya Schilleriana*, with large and well-coloured flowers; and *Angraecum falcatum*, from M. A. Wineqz. *Vanda cœrulea*, a magnificent plant, with flowers quite unusual for their size and for their bright bluish colouring, from M. J. Moens. Beautiful examples of *Cattleya aurea*, *Odontoglossum Insleyi* var. *O. Harryanum*, and *O. grande*, *Cypripediums Io*, *Elloradio*, and *vexillarium*, all splendid as to colouring, were sent by M. le Dr. Van Cauwelaert. *Coryanthes leucocorys*, *Mesospindium vulcanicum* var. *grandiflorum*, with large flowers; the curious *Nanodes* (?) sp., *Mormodes baccinator* var. *aureantiacum*, of a beautiful orange yellow; *Trichocentrum triquetrum*, *Eulophia pulchra*, *Cirrhopetalum Brieanum*, *Cypripediums tonsum*, *regale*, *Arthuriannum*, and *cananthum superbum* (bearing about twenty flowers); *Oncidiumis Lancœanum*, *aurosium*, and *Forbesi*; *Vanda cœrulea*, well bloomed; *Burlingtonia granadensis*, *Cochlioda Nützliana*, *Odontoglossums Lucianianum*, *crocidipterum*, and *Andersoni*; *Cattleya aurea*, with a rather spreading lip, and of splendid colouring; and, finally, the magnificent specimens before mentioned of *Cattleya Warocqueana*, showing much diversity and beauty of colouring, sent by M. Linden. The jury awarded the following First-class diplomas: For *Angraecum du Bayssoni* to Madame E. Gibeze; *Coryanthes leucocorys* from M. Linden, *Mesospindium vulcanicum grandiflorum* from M. Linden. Botanical Certificate awarded to *Nanodes* (?) species, from M. Linden. First-class Certificates of Merit were awarded for *Cattleya aurea*, from M. le Dr. Van Cauwelaert, unanimously awarded, *Cypripedium Rothschildianum*, from M. Dallemagne, unanimously awarded, *C. vexillarium*, from M. le Dr. Van Cauwelaert, unanimously awarded, *Dendrobium Phalaenopsis*, from M. Van Imshoot, unanimously awarded, *Odontoglossum Insleyi*, from M. le Dr. Van Cauwelaert. Four Certificates were awarded for four varieties of

Cattleya Warocqueana; two sent from M. Warocqué, two from M. Linden. *Cattleya aurea* var. *Lansbergeana*, from M. J. van Lansberge; *C. maxima* var. *Malonana*, from M. Warocqué, also were awarded First-class Certificates. Second-class Certificates of Merit were allotted for *Cattleya Schilleriana*, from M. A. Wincqz; and *C. aurea* from M. J. van Lansberge. First-class Certificates for cultivation were awarded for *Vanda cœrulea*, from M. J. Moens, unanimously awarded. *Cattleya Warocqueana* (*labiata autumnalis*), from M. Warocqué; and *Cypripedium Roebelinii*, from M. Van Inshoot.

DORYANTHES EXCELSA.—We learn that this noble plant is now flowering for the second time in the Trinity College Botanic Garden, Dublin. Mr. BRIDGE will have to find some other notable plant to celebrate the tercentenary of Trinity College, which will occur next year.

KELWAY MEDALS FOR GLADIOLUS, PÆONIES, AND PYRETHRUMS.—We are reminded by Messrs. KELWAY that five handsome and valuable Kelway Medals may be won by amateurs in 1892, viz., four large Silver Medals, and one large Silver-gilt. They are given to extend the cultivation of improved forms (of British origin) of some of the most beautiful flowers which can be grown in the gardens of the United Kingdom, and are as follows:—Mr. JAMES KELWAY will again present the Kelway Gladiolus Medal (Silver) to the Royal Horticultural Society, to be awarded by them at one of their August meetings for the best exhibit by any amateur of twelve varieties of British-raised Gladiolus—distinct hybrids of *G. Gandavensis*. Mr. WILLIAM KELWAY will present the Kelway Medal (Silver-gilt) to be awarded in the same manner at a June meeting of the same Society for the best exhibit by an amateur of a collection of three single and nine double-flowered varieties of herbaceous Pæonies, three blooms of each variety. Also the Kelway Medal (Silver) at a June meeting for the best exhibit by any amateur, of a collection of flowers of six single and six double varieties of Pyrethrums, three blooms of each variety.

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM.—The sale of this handsome plant, which the importers, Messrs. F. SANDER & Co., aptly term the "Elephant Moth Dendrobe," at Messrs. PROBEROE & MORRIS' rooms, 67 and 68, Cheapside, E.C., proved one of the Orchid sensations of the season, as announced in the advertisement of the sale in the *Gardeners' Chronicle*, October 10, p. 419. The event brought together the finest company of buyers which have attended for some years, and the plants of any importance realised from three to six guineas each, and, in a few cases, ten guineas; while one mass fetched twenty, and another twenty-eight guineas. Some of the smaller bits, and unstarted plants not potted up, and with but few leading growths, fetched lower prices, in proportion to their quality, and the whole, including a few lots of true old autumn-flowering *Cattleya labiata*, realised between £2000 and £2100. As is always the case when a good thing is fairly offered, everyone seemed well satisfied both with the plants and the prices.

EALING DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—On Tuesday, the 20th, the above-named Society organised a competition for dinner-table decorations, when the exhibits were staged in Prince's Hall, Ealing, and filled six tables, all provided with a uniform arrangement of vases, and laid in the same way. The decorations shown by Mr. HUDSON, of Gunnersbury, were composed of growing foliaged plants, some variegated, others green; the effect was distinct and unusual, but somewhat sombre. Mr. WHITAKER's table was crowded with many flowers and numbers of small specimen vases; *Pancretium*, *Gloxinas*, *Allamandas*, *Pelargoniums*, *Roses*, *Cyclamens*, and other flowers were arranged with Fern and scraps of Pampas-grass. On Mr. MENDEW's table, tawny and pink flowers predominated; pink *Odontoglossums*, brownish *Cypripediums*, *Dendrochilums*, *Pelargo-*

niums, *Primulas*, and *Chrysanthemums* were chiefly used. Mr. PENNEY crowded his table with many small vases and many and most varied flowers, which were put together with imperfect attention to colouring; *Fuchsias*, *Carnations*, *Hoyas*, *Abutilons*, *Roses*, *Lilies*, *Primulas*, *Canary Creeper*, and many other flowers, were interspersed with coloured and green foliage. Mr. COOPER employed principally *Stephanotis*, *Tuberose*, *Hoyas*, *Allamandas*, *Japanese Anemones*, and *Salvias*; for foliage, *Asparagus*, scarlet leaves; and two varieties of grass. Mr. PREWETT, Swiss Nursery, Hammersmith, was wise in confining himself to red, yellow, and white flowers; *Pelargoniums*, *Allamandas*, *Eucharis*, *Pancretiums*, and *Chrysanthemums*, were arranged in the tall vases, and in several small glass baskets. Altogether, the exhibit was a satisfactory one, and reflects credit on the organisers.

LONDON INTERNATIONAL FRUIT SHOW.—As will be seen from an announcement in another column, it is proposed to organise a great fruit show in London in 1892. A meeting will be held to consider the project, at the Cannon Street Hotel on Friday, October 30, at 3 P.M., when Alderman Sir JAMES WHITEHEAD, Bart., will preside. This is a matter for the Royal Horticultural Society specially to consider, and whether the Society undertakes the matter itself, or in co-operation with other bodies, the Society should, as the national representative body, either take the foremost position or none at all.

THE HARVEIAN ANNIVERSARY.—On Monday, October 19, Dr. W. H. DICKINSON delivered before the Royal College of Physicians the annual Harveian oration. The lecturer reminded his audience of the importance of the famous physician's discovery, and added that "It was not too much to say that the medicine of to-day was scarcely less permeated with the results of HARVEY'S discovery than the human body with the circulation which he discovered." During the afternoon, the President of the College (Sir ANDREW CLARK) presented the Baly Gold Medal for "Researches in Physiology" to Professor FOSTER of Cambridge; and the Moxon Gold Medal for distinction in clinical medicine, especially in connection with "Gout," to Sir ALFRED GARROD. The latter medal had never before been awarded.

FLOWERS AT THE WORLD'S FAIR.—At this much-talked-of exhibition, at Chicago, everything is to be on a vast scale. It is estimated that the total cost of the horticultural department alone will be about £156,250. Ten acres of ground are to be planted, some portions with *Roses*, *Lilies*, *Rhododendrons*, &c.; others with wild flowers. The number of *Roses* used will be about 100,000; there are to be 500,000 *Pansies*, and unlimited numbers of other flowers.

PROFESSOR HELMHOLTZ.—The Emperor WILLIAM has shown his sense of the value of Herr HERMANN VON HELMHOLTZ'S work and discoveries, by appointing him a member of the Privy Council, with the title of Excellency. The compliment is doubly great on account of the friendly way in which the Emperor intimated the news to the Professor, whom he hoped would long live to enjoy his new honours, and benefit "Germany and the whole world."

SEEDLING TACSONIA.—Mr. SMYTH recently forwarded us a flower of a seedling *Tacsonia* raised by him, as he supposes, from *T. manicata*. As the resemblance is very slight, we venture to doubt this origin. It seems to us more likely to be a seedling from *T. mixta*. The leaves are divided half-way down into three lanceolate, finely-toothed lobes, glabrous above, downy beneath. The petiole has about four pairs of sessile glands. The bracts form a cylindrical sheath, 1½ inch long, and slightly downy especially within; the free tips of the bracts are ovate lanceolate. The flower-tube is 3½ inches long, cylindrical, slightly dilated at the base, green, and almost entirely glabrous. The limb of the flower is about 3 inches across, the sepals oblong acute, aris-

tulate, keeled, green, slightly downy; the petals as long as the sepals, rosy-pink. The corona is very small, of two rows of tubercles, the outer lilac, the inner white. Ovary elliptic, downy. The plant was grown in a 10-inch pot, plunged to the rim in a south border against a wall, and flowered very beautifully in that situation. At the approach of winter the pot can be lifted.

FRUIT CONGRESS IN MANCHESTER.—As these lines are passing through the Press, a great Fruit Exhibition and Congress are in progress in Manchester. Some account of this will be found in our present issue, and we shall refer again to the matter in our next number.

SULPHO STEATITE.—This substance, which is a mixture of sulphate of copper and silicate of aluminium and magnesia, has been tried in the School of Horticulture at Ghent this season, in comparison with the Bordeaux Mixture. The result, according to the *Lindenia*, was that the one is as efficacious as the other, and that practically it is a case of the difficulty of selection.

PLANE TREES AT GHENT.—The *Illustration Horticole* states that the Plane trees in the boulevards of that city have lost their leaves prematurely. Red or brown streaks run parallel with the nerves. M. DE NOBLE, of the School of Horticulture, has ascertained that the trouble is due to the occurrence of a fungus—*Glaeosporium nervisequum*. A 3 per cent. solution of sulphate of copper, used in the form of spray, is recommended.

DECORATIVE GROUPS.—We understand that Mr. WILLIAMS, gr. to S. BAERLEIN, Esq., of Didsbury, who has been a very successful exhibitor in competitions of this nature, and who gained the Royal Horticultural Society's Medal at Matlock this year, has expressed his intention not to show in future.

PEACH BLISTER.—M. DE LA BASTIE, President of the Pomological Society of France, is said to have prevented the occurrence of this pest by the use of sulphate of copper.

VANDA SANDERIANA, GOLDSMID'S VAR.—This is by far the finest form of this noble species which we have ever seen. It comes from Sir JULIAN GOLDSMID, Somerhill, Tonbridge, in whose choice collection it has just flowered. It gains at all points over the type, viz., in size, perfect form, brightness of colour, and effective display of the markings. The flower is just 5 inches across at its widest, the sepals 2 inches, and the petals 1½ inch in width. The petals and upper sepal are of a bright rose colour, with some beautiful crimson spotting and veining on the lower halves. Almost the entire surface of the lower sepals is heavily veined with a claret-coloured tracery, various shades of crimson mingled with the tawny-yellow which margins the sepals, and is visible in the lower edges of the petals showing between the lines. It is a common thing for anyone who flowers a fairly good *Vanda Sanderiana* to fall into ecstasies over it, and think there was never one like it before; but Sir JULIAN'S flower will withstand the test of comparison, at all events, it would take an unusually beautiful variety to beat it.

THE CHELTENHAM HORTICULTURAL SOCIETY held its annual dinner on the 7th inst., when Mr. CYPHER proposed success to the Society, coupling the toast with the name of the Mayor as President of the Society.

CHISWICK.—The ill-fortune that, so far as the weather is concerned, attended the exhibition of Conifers at Chiswick was, let us hope, terminated by the destruction of one of the tents in the great gale of October 13. As the accident did not occur till after the close of the exhibition, the results were not so serious as they might otherwise have been. The Sunflowers have set in consequence of the heavy storms to which they have been subjected, but many of the *Asters* are still in full beauty, such as the varieties known as *Harpur Crew*, *bessarabicus*, *vinineus*, *diffusus* and its varieties, *horizontalis*, and

pendulus; the Kew form of *Aster versicolor*, a charming little bush, covered with pink stand whites; the tall *Asters Novæ-Angliæ rubra* and *rosea*, and a very fine sort with large blue flowers, provisionally named *Melpomene*. It is interesting to note, that in spite of the battering rain and hail, the tuberous *Begonias* in the beds are, comparatively speaking, little the worse.

CIERGNON.—The King of the Belgians, whose interest in horticulture is well known, and whose gardens at Laeken, under the superintendence of Mr. KNIGHT, are also well known to many of our readers, has a fine establishment at Ciergnon, in the Ardennes, where his majesty has been his own landscape gardener. In a subsequent issue we shall publish an account of this magnificent establishment, which the great pressure on our space forbids us doing at present.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The fortnightly meeting of the above was held on Wednesday, the 14th inst., when a paper was read by Mr. H. BROWN, on "Exhibition Onions." A discussion followed the reading of the paper.

CAUTION.—Nurserymen should be on their guard against the depredations of members of the Long Firm. One man is well known to the police, but, unfortunately, no one comes forward to prosecute, and consequently, as is stated in a note from the Detective Department before us, the firm "go on getting goods from all parts of the country."

WEDDING.—The only daughter of Mr. OLIVER GOLDSMITH, the respected head gardener to Sir WALTER FARQUHAR, Bart., Polesden, was married on Saturday, October 17, at St. Nicolas Church, Bookham, to Mr. ED. BATES, of that place.

HOME CORRESPONDENCE.

MELON WEBB'S PRESIDENT.—I am very pleased with this new Melon, and, notwithstanding the already long list of varieties being cultivated, I consider it a decided acquisition. It is the result of a cross between *Hero* of Lockinge and *Hendre Seedling*, both handsome, free-bearing, and high quality varieties. The fruit attains to a good size under ordinary cultivation, is oval in shape, of a deep yellow colour, well netted, and of fine flavour, the flesh being white, firm, and deep. The plant is of good constitution, a good grower, showing bloom and setting its fruit with great freedom. *H. W. Ward.*

CUCUMBER STOURBRIDGE GEM.—This excellent Cucumber was sent out a few years ago by Messrs. Webb & Sons. It was secured by fertilising the flowers of *Telegraph* with those of the *Prince of Wales*, and it partakes largely of the qualities of the former well-known and highly reliable variety. It is a vigorous grower and very prolific, bearing straight, handsome, clean, and symmetrical fruit, from 18 inches to 24 inches in length, the flesh being very white, crisp, and of good flavour. *Stourbridge Gem* is quite as suitable for winter cultivation as it is for summer. *H. W. W.*

VINES AND PEACHES IN ONE HOUSE.—It is often asserted that Vines and Peaches cannot be successfully cultivated in the same house, and that many attempts to do so have ended in failure. This is too broad an assertion to make. In a long span-roofed vinery, which runs east and west, and which is divided by a partition in the centre, in the gardens at Barham House, near Newbury, there is the best example of this kind of cultivation which I have yet seen. The Vines, late varieties, are *Lady Downes*, *Gros Colmar*, and *Black Alicante*, and they are grown on the south side of the house; the bunches, although not quite up to exhibition form, are useful table samples, and had the appearance of being capable of keeping for a long period of time. The Peaches were *Walburton's Admirable*, and others, the former bearing a capital crop at the time of my visit; the fruits of *Pine-apple* and *Lord Napier Nectarines* were excellent. The trees showed by their healthy appearance, matured wood, and the

deep colour of the leaves, that the treatment they were receiving suited their requirements, and augured well for the future. A free system of training is followed, and the trellis right up to the apex of the roof in the "Paxton" houses was entirely covered by the trees. The method of ventilation adopted in this class of house may have had something to do with the success, air being admitted the whole length of the roof. Anyhow, after seeing these trees, I shall have no hesitation in advising others to follow the plan of combining Vines and Peaches, but I would advise that the trees be planted where only late varieties of grapes are grown, the temperature needed for late Vines in the spring being more agreeable to the Peach and Nectarine trees. *E.*

LILIES IN 1891 AT OAKWOOD.—I send my usual autumnal note on the blooming of my Lilies in the past season. *Lilium Hansonii*, *L. Leichtlinii*, *L. odorum japonicum*, the Lily soid as the new red form of *L. Leichtlinii*, but which seems to me to be the old *L. tigrinum jucundum*, *L. pardalinum* and its varieties, *L. Brownii*, *L. superbum*, *L. giganteum*, *L. cordifolium*, and *L. tigrinum splendens* were all very fine, *L. auratum rubro-vittatum*, and some *L. auratum macranthum*, and especially one coloured like *L. a. pictum*, were especially good. *L. candidum simplex*, only moderate; *L. auratum* suffered a good deal, first from the hail showers bruising the buds, afterwards from the cold heavy showers and high winds; and individual plants had fine flowers, but the most of the plants had enough damaged buds or flowers to disfigure them. This unkindly season gave a good lesson as to the difficulty of growing *L. auratum* in cold damp climates. *L. speciosum* and varieties varied much. Our finest flowers were on plants high up on the "mountain" at Oakwood, where the air about them was dry, and in a sunk tub with the bottom out at the entrance gate at Heatherbank, where they are sheltered by shrubs from the sun, but exposed to much wind; these are still in great beauty. In some damp quite sheltered places at Oakwood these Lilies bloomed well, but in damp exposed places many of the flowers were spoilt. This was our first year of growing *L. odorum japonicum*; it flowered well out-of-doors, and had a sweet scent, the back of the flowers had a dark shade, but not the rich dark colour of *L. Brownii*—those grown in our Lily-house were pure white and the scent delightful. If they stand out of doors as well as *L. Brownii*, and we have planted them in different situations to ascertain this point, I think that they will deserve to be more generally grown. Many experienced gardeners have seen our plan of growing Lilies, when exposed to tree and shrub roots, in such casks with the bottoms out, and approved of it. I had lately a pleasant criticism on Oakwood, a first-class amateur lady gardener owning a beautiful garden, after having carefully looked over our plants, said, "I hardly know what this place should be called—it isn't a garden." I agreed it was not a garden. She then said, "It is a place where plants from all parts of the world grow wild." This is exactly what I am aiming at, and if any success has been scored, it is in great part due to friends in many countries having helped with seeds and plants. *George F. Wilson.*

WALNUT TREE FRUIT FAILURE.—In regard to "F. M.'s" note in last week's issue of the *Gardeners' Chronicle*, respecting the failure of his Walnut tree to ripen its fruits, notwithstanding the healthiness and vigour of its branches and leaves, my opinion of the matter is, that probably this may arise from the lack of phosphoric acid in the soil. We know that this element is an important factor in seed formation, and that Walnuts especially are greatly dependent upon an available supply of this substance in the soil, which, in the case in question, may have become practically exhausted. From some recent investigations which have been made, it seems that as the season of the year advances, there is a retrograde movement of the phosphoric acid of the leaf to other parts of the tree; and as the seed is well known to contain a relatively large quantity of this acid, we may legitimately be allowed to think that the food elaborated in the leaf, when in sufficient available amount, finds its way into the fruit, and thus assists in its development and maturation. Remedy:—As a remedial measure, it might be advisable to apply a dressing of 3 or 4 lb. of superphosphate of lime, and the same weight of kainit salts; or if the soil or subsoil is not of a chalky nature, then 6 or 8 lb. of basic slag may be used instead of the superphosphate, with 3 lb. of kainit salts. This should be sown broadcast around

the tree over an area of about 2 poles of ground, and dug in during the present autumn. *J. J. Willis, Harpenden.*

CONING OF CEDRUS DEODARA.—I am pleased to be able to add to the list you have given in the *Gardeners' Chronicle* of trees of the above-named Conifer coning this year, one which is growing here. This tree, which, without searching, I see is bearing four cones, equal in size to the one figured in your journal of October 10, p. 423. There are also on the same tree scores of male catkins yet unripe, and this same tree bore male catkins thirty years ago, and on several occasions since, but never to my knowledge bore a female cone before. Several trees of this Conifer on the grounds here in less exposed situations, and of the same age, died one after another. They appear to enjoy plenty of air—in fact, this seems necessary for them, if not too much exposed. *Henry Mills, Enys, Penryn, Cornwall.*

FIGS FROM THE OPEN WALL.—I send you three Figs gathered from the open wall, and grown without any protection whatever. The size of the fruits this year is but little more than half what is usual. Although there is a very heavy crop, I do not expect many more will ripen after this time. Considering the cold, unless, and wet season we have experienced here, it is remarkable; during July alone we had a rainfall of 6.50 inches, and August was but very little less. It may interest some of your readers to know what can be grown in the far north within a mile of the Moray Firth, and only 100 feet above the sea-level. Peaches, as a rule, do well outside, but this season the blossom had a very trying time to come through, as the weather in the month of March was very severe here this year; the biting wind at that season is our worst part of the year. *J. F. Smith, Cullin House Gardens, N.B.* [The Figs were wonderfully fine examples to be grown on the open wall so far north. We doubt if they would have ripened so well in the neighbourhood of London. Ed.]

JOHN DOWNIE CRAB.—I was pleased to see a notice, in your issue of the 10th inst., of a description of the ornamental Crab, John Downie. This is a variety of Crab which deserves to be better known than it is at present, and it undoubtedly will become a great favourite with planters. Five years ago I obtained six healthy, well-grown trees from Mr. Downie's nursery, in Edinburgh, and planted them in the orchard among the Apple trees, and they bore a very heavy crop of yellow-skinned fruit. I took the trees from the orchard, and planted them as ornamental specimens, and they were this season perfect pictures in the spring and autumn. It is a tree that grows vigorously and flowers profusely. It is, like most of the Crabs, not particular as to soil, situation, or aspect, but it certainly dislikes the too great use of the knife; a careful thinning out each winter, where the young shoots crowd each other, and balancing the growth, are all that is needed. The fruit makes a good preserve. *M.*

SUBJECTS OF STUDY FOR GARDENERS.—The correspondence on this subject is a promising sign. There have been similar signs before, but after the appearance of some letters in the gardening Press the subject has lapsed, and no definite steps have been taken. It ought not to be too much to hope that something, however small, should result from the present discussion, and an earnest endeavour made to satisfy a need which undoubtedly exists. As Mr. F. W. Burbidge points out in his letter, "it would be a fine opportunity for the Royal Horticultural Society for promoting a forward movement in gardening, and fostering unity amongst the craft, which would realise splendid results; the Society receiving the gratitude of gardeners." There is now, as ever, need for improvement, so that the younger generation may keep abreast of the times, and the higher the standard is fixed the better for them; and if horticulture is to advance, the leading workers must add largely to their knowledge. It rests with young gardeners of the present what the future of horticulture in this country shall be—the outlook is not discouraging. The subjects for thought are many. Essentials, such as good writing, grammar, and conversation are worthy of acquirement; and a knowledge of the structure of plants, and the chemistry of soils would be of great advantage to all. Other subjects are a knowledge of the French or German languages, and shorthand; and not to ignore the artistic side of life, drawing and music should be included. But the desire to acquire knowledge often exists where the facilities for learning are wanting, and in the remote localities this is commonly the case, and as a con-

sequence interest in higher attainments gradually dies out finally. We owe much to the gardening Press of this country, but it does not provide in a satisfactory manner for the needs of the younger gardeners. If a page were set apart for contributions by them, and articles inserted regularly on a variety of topics by the best writers, it would be received with delight. Will editors do this? The idea is worthy of serious consideration. *Fred. R. Swan, Enville Gardens, near Stourbridge.* [Our young friend's letter, like others that we have received on the same subject, exhibits the common shortcomings of the school teaching of this country, and points to the need that exists for a better and clearer knowledge of the English language, and for clear thinking and intelligible composition, before any of those other subjects which he deems necessary to complete a gardener's education are tackled. Ed.]

— I felt very much interested lately in the note by "W. L.," p. 432, of this journal, and should like to find in every number of any horticultural paper an article on botany, for I think that the horticultural papers ought to be interesting, not only for the older gardeners, but for the younger men. As for Mr. Burbidge's note in last week's issue, I fail to see how his advice can be termed practical as regards the majority of us young gardeners. As a rule, young gardeners have not much money at their disposal, and where there is no other source than the wages they get, there is a very poor chance for them of possessing many scientific works. Nor has their profession much encouragement to offer, even should they be able to scrape the necessary sum of money together. What is to become of them after all? I have amongst my acquaintances here young gardeners employed, much against their will, as Cucumber growers. They have served an apprenticeship in really good establishments, but are obliged to follow this branch of our trade for the want of something more interesting or better. Suppose, now, the gardener, possessed of all this scientific knowledge, has to slave, for the sake of a living, from 6 A.M. till 8 P.M. in Cucumber or Tomato-houses; or, perhaps, chances to be engaged as a single-handed gardener, if he is married and without encumbrance, provided he can milk a cow, and does not object to a little house-work, would it not make those men feel their poor condition and prospects much keener if they had studied the books mentioned by Mr. Burbidge? *J. J. C., Ponder's End.*

THE JAMES GRIEVE APPLE.—In your issue of October 17, I note that the Scottish Horticultural Association has awarded this (in my opinion) grand new Apple a Certificate. We had from the raisers, the Messrs. Dickson & Co., of Edinburgh, two young bushes three years ago, and I have been so pleased with them, that I wish that many more had been planted. It is a free grower, and has borne excellent crops for two years running. By same post I send you a couple of fruits for your opinion. *J. Jeffrey, Caversham Park.* [An autumn fruit, of good appearance, and first-rate quality for cooking purposes; height 2½ inches; width, 3 inches; colour, yellow, with crimson flush and streaks on the sunny side. Ed.]

HARDY PERENNIALS.—The present question is not botanical—it is purely horticultural. By that, I mean, I look at it from a gardening point of view; so, I am afraid, I cannot accept your answers to my questions. Now, as regards bulbs, one of our oldest and most respected judges, Mr. T. Baines (I hope he will pardon me for introducing his name into this discussion), has, I am informed, expressed his opinion that what is not excluded from a schedule, is included. This opinion I have heard endorsed by several other good judges, and I am quite prepared to accept it. Now, nothing was said about bulbs in the Royal Horticultural Society's schedule; it was only stipulated that Sunflowers and Asters were to be represented. Consequently, I maintain that I was quite within my rights in showing cut blooms from a bulbous plant; and let me ask if the society's judges propose to make it a rule to exclude bulbous plants, why were the prizes awarded at the July meeting? We nearly all showed Lilliums, and nothing was said about it. Again, looking at local shows, nearly every other box exhibited by cottagers contains spikes of that grand old Lily, *L. candidum*, of which one can hardly say too much, especially as a cottager's plant. I think you will admit that this is hardy, and as it throws up its glorious spikes of flower year after year, I fail to see how, from a gardening point of view, it must

not be considered perennial, and there will be endless trouble if they are to be disqualified at our smaller exhibitions. Now, as regards Pentstemons: you refer me to Nicholson's *Dictionary*. I accept it. Kindly look at p. 71, at the end of paragraph 2, you will find—"The best plan is to insert cuttings annually, and preserve stocks in a cold frame. If any old plants are to be kept outside, they should be covered with ashes." You were kind enough to say that I am qualified to frame a definition of a hardy perennial; a plant of this description is, in my opinion, a long way from it. I am quite aware that there are hardy species of Pentstemons, but we are now considering the named varieties usually grown in gardens, most of which, I believe, originate in France. I have informed my gardener that I consider he fairly won his prize, and shall pay him his prize-money, and as I consider the matter ought to be definitely settled, I propose to bring it before the Council of the Royal Horticultural Society. *W. Marshall.* [There is so much to be said on either side of the question, and judges of equal standing and competence offer such conflicting opinions, that we are glad our correspondent intends to bring the matter before the Council of the Royal Horticultural Society. Awaiting their decision, we hold that it is not expedient as a matter of horticultural procedure, entirely apart from botanical considerations, to mix up bulbs with hardy perennials. Ed.]

THE TEDWORTH GLASS-HOUSE.—I was very much interested with the account given in the *Gardeners' Chronicle*, October 17, of the great glass-house of Tedworth Park, which was afterwards removed to Southbourne-on-Sea near Bournemouth. The estate forming this new district was purchased by T. A. Compton, Esq., includes nearly one mile of foreshore, and is very pleasantly situated, having good views of the Isle of Wight and the Needles. The above great conservatory, with large pleasure grounds formed around, was afterwards called the Winter Gardens, Southbourne-on-Sea. I was manager there for four years; while there I remodelled the heating of this large house, taking out the four old saddle-boilers which did the work very badly, and using instead one of Week's large Duplex Tubular Boilers which did the work in a very satisfactory manner, heating eight rows of 4-inch piping, altogether about 2584 feet. I also brought the heating of all the smaller plant houses under one boiler instead of three as before. While at Southbourne I had what, I suppose, has never been attempted since, a Chrysanthemum show consisting of 5000 plants, all grown at the Winter Gardens. I herewith send a photograph of the conservatory as it appeared in winter; its length, as erected at Southbourne-on-Sea, was 323 feet, or nearly 108 yards, and a width of 40 feet. *W. Bailey, Superintendent, Southwark Park, S.E.*

SCOTLAND.

SPLITTING OF PEACHES AND NECTARINES.

The causes of splitting and decaying of stones in Peaches and Nectarines is often attributed to over-watering; but, judging from many instances, where the evil has shown itself in its worst form, it may be fairly said that injudicious application of water is productive of the evil, especially to gross-growing trees, when the fruit is ripening; and on well-trained borders, too, there is no exception. Often, at stoning-time, trees under glass are allowed to get dry (outside, the roots have to take what the elements supply), and when the crop is considered safe, and about to swell into the ripening stage, a good soaking of water is given to the roots, and the syringe is freely applied when the house is shut up with strong heat. The sudden reaction is more than the elasticity of the fruit can stand (many varieties, at least), and it is bound to give way at the stone or in the flesh. Dryness at the roots of Melons, Grapes, and other fruits, which causes the skin to become brittle, succeeded by a moist atmosphere, is sure to be running a risk of having cracked fruit.

It is well known how liable to crack the Stanwick and Victoria Nectarines are; but if kept in good healthy action at the roots till stoning is completed, and a dry bracing atmosphere, night and day, during the ripening period, little difficulty need be feared from cracking or stone-splitting. Stone fruits gene-

rally suffer more from lack of moisture at the roots (especially on thoroughly-drained borders) than from too much water. *T. C. H.*

THE HORTICULTURE CLASS, HERIOT-WATT COLLEGE, EDINBURGH.

The class for tuition in the technology of horticulture, which was opened in 1888 in connection with the Heriot-Watt College, Edinburgh, and was continued the following year, but lapsed for lack of interest, is again re-opened under, we hope, more favourable circumstances. The introductory lecture for the session 1891-2 was delivered by the lecturer, Dr. J. H. Wilson, on the 16th inst., the subject being, "A Gardener's Training."

The lecturer held, that the education of a gardener in these days should be, like that of others, as good, full, and thorough as it is possible to be. In order to advance his own position, or contribute to the advancement of his profession, he must be superior in education. In general, the definition of a gardener's education might be put into two propositions—(1) mental training, to be derived from books, lectures, classes, mutual improvement societies, and the like; and (2) manual training, to be derived from the practice of his professional duties. The lecturer then described in detail the various subjects in the prosecution of mental training which gardeners should give their attention to. The array of subjects was apt to perplex and dishearten the beginner; but if he would bear in mind that the "world of books" contains in the main the same facts, more or less differently expressed by different authors, he would cease to despair. After a thorough grounding in the three "R's," the gardener-student was recommended to give his attention to pen-and-pencil sketching, free-hand geometrical drawing, and botanical drawing; a systematic study of the mother-tongue, particularly with regard to acquiring an easy and clear style of expression by the study of masters of composition, rather than the hard and fast rules of grammar; Latin sufficient, at least, to enable the student to appreciate the meaning of plant names. Botany and horticulture being indissolubly connected, the gardener-student should inquire particularly into the structure and physiology of plants, and all that relates to the fertilisation of flowers, improvement of crops, &c. In short, a very thorough curriculum was laid out for the gardener-student; and the syllabus of the class for the session just opened will aid all who attend in acquiring a knowledge of some of the subjects indicated in the lecture. The following is the syllabus for the session:—Good and Bad Soils: the plants which grow on them naturally; the effects of cultivation on the soil and on the plant. The Introduction and "Acclimatisation" of Exotics. Vegetables, Fruits, and Flowers: the history, uses and peculiarities of varieties usually grown. A Flowering Plant: its structure and life history; conditions conducive to healthy growth; natural and artificial regeneration of soil; diseases of garden crops; methods of prevention and cure; choice of site for a garden. The Physiography and Climatology of the Garden. Landscape Gardening: its various schools. Land Surveying. The Application of Geometry, Mensuration, and Levelling in the Laying-out of Grounds. Hothouses: their design, construction, and uses; heating and ventilating. Culture of Culinary Vegetables: growing for market. Culture of Fruits: pruning, thinning, and training. Culture of Herbaceous and Pot Plants: principle of propagation; cuttings, layers, and grafts; sports. The Fertilisation of Flowers. The Reproduction of Ferns and Selaginellas. The Improvement of Plants by Hybridisation and Selection. A Review of the Progress of Horticulture. Horticulture as a Recreation. Town Gardens. School Gardens.

CHRYSANTHEMUMS ABOUT LONDON.

THE PARKS.—The London County Council have ample cause to be proud of the remarkably fine exhibitions of Chrysanthemums of the best varie-

ties which the various park superintendents have provided for the delectation of the masses this autumn. As evidence of the interest which the people take in these displays, it is worthy of mention that in the respective parks in which the shows were ready—Battersea and Southwark, especially—the houses were literally crammed during Sunday last, several thousands of persons visiting each place. Higher reward for the County Council, or those whose skill has furnished these charming exhibitions, could hardly be conceived. How truly in flower-love do we find that one touch of Nature which makes the whole world kin.

Finsbury Park.—Visitors to this northern lung of the metropolis, alighting at the railway station, will do well to take a tram to the upper gates, as the Chrysanthemum-house is near that inlet. This is a structure of 100 feet in length, and 18 feet broad, has boarded sides, and a glass roof. The plants are ranged in double-fronted fashion right down the centre, with a narrow footway on either side. Due, perhaps, to the greater elevation of Finsbury Park, Mr. Mardlin's flowers are rather earlier than elsewhere, and some few show the effects of the recent damp weather. Here the show will be at its best about the 30th. All the plants are in fine foliage, and very neatly arranged, and can hardly be less than 1500 in number. A quantity of Pompons face the slopes, and thus hide what otherwise would be unsightly pots and stems. Japanese forms are, of course, chiefly grown. These are the favourite flowers of the public, whilst there are some good incurved also. Of these the new M. A. Brahaut is finely shown, and there are also Mr. Bunn, Prince of Wales, White and Golden Beverley, Jeanne d'Arc, G. Glenny, and others. Of Japanese very good are Elaine, Avalanche, Stanstead White, Thunberg, Gorgeous, Criterion, Princess Beatrice, Mons. H. Jacotot, Mr. W. Holmes, very beautiful; James Salter, Macaulay, Eynsford White, Margot, Madame B. Pigny, Comte de Germiny, Stanstead Surprise, Mons. Tarin, generally excellent; Phœbus, Madame De Levin, Viviani Morel, M. Bredemeier, and the large Etoile de Lyon. That charming early Pompon, Madame Elise Dordan, is also exceedingly beautiful.

Victoria Park.—Here the Chrysanthemum-house is fully a mile and a half from the station of this name, and is much nearer to the Cambridge Heath Station of the Great Eastern Railway. The house is again a span 100 feet long, but fully 25 feet wide, making a fine expanse. Then the foot-way in this case runs down the centre, a straight line being of necessity kept because somewhat foolishly the heating pipes are laid low beneath the iron grating, and might almost as well for the drying of the air of the house, not be there at all. Here Mr. Gibson's able grower, Mr. Large, has marshalled, in rich array, some 2000 well-grown plants, these banks also being fronted with dwarf Pompons. In about ten days this house will make a glorious show, probably by far the best of its kind in London, for the banks of flowers slope fully 10 feet on either side. Here again the "fops," as they are tersely termed, are in the ascendant, and includes both the hirsute varieties, Mrs. Alpheus Hardy, very good, but much better still is Louis Boehmer, the pink variety, which is so much more robust. Also Etoile de Lyon, E. Molyneux, Mons. H. Jacotot, very fine, Elaine, Avalanche, Criterion, Mr. W. Holmes, Mons. Tarin, Lady Selborne, Jeanne Marty (Anemone), Joseph Mahood, Grandiflorum, Hamlet, Madame de Sévin, Stanstead Surprise, Lady Lawrence, Glorie de Bocher, rich chestnut; E. Audiguier, and Bouquet Fait. Of incurved, the best are Prince of Wales, Prince Alfred, very fine; White and Golden Beverley, Mr. Cobay, St. Patrick, Queen of England, Novelty, Lord Wolsley, and Miss Hope. Madame Elise Dordan is also very prominent here. Later, very many more fine varieties will be in bloom. The show was open only on the morning of our visit, October 20, and will keep gay for about six weeks.

Southwark Park is best reached from Deptford Road Station of the District Railway, which is about

half a mile from the site of the Chrysanthemum house. The structure is about 60 feet by 25 feet, a broad span, which enables Mr. Franshaw, who grows for Mr. Bush, the park superintendent, to group his plants in the centre and sides; so that the arrangement differs from the other park displays. Then he has also furnished some elevations and undulations in his grouping, which is in that respect also the most artistic. Generally the plants, as elsewhere, are wonderfully well leaved, and country growers, who make so much of their cultivation, would be surprised to note how, under conditions of atmosphere of the most trying kind, these London growers turn out such capital plants and blooms. Here, of Japanese varieties, Mr. W. Holmes was abundant, and very beautiful. No finer memorial to the former secretary of the National Chrysanthemum Society could have been created than is this remarkably fine variety; also good are E. Molyneux, M. Planchenau, Phœbus, Orientale, Bertier Rendatler, Mrs. J. Wright, Ada Spaulding, Telephone, Florence Piercey, Avalanche, La Triompbante, Fair Maid of Guernsey, Lady Selborne, and a rich dark variety, Mrs. C. Wheeler. Of incurved forms, excellent are Mr. Cobay, Golden Beverley, Prince of Wales, H. Shoemith, Princess of Wales, Mr. Bunn, Golden George Glenny, and Refulgens. The collection will be at its best in a week or ten days.

Battersea Park.—Somewhat less than one mile from the Battersea Park Station of the London and Brighton Railway, and located in one of the large glass-houses of the reserve garden, is the display of Chrysanthemums. The house is 120 feet long and 10 feet wide, presenting a single bank of remarkably bright-coloured flowers, though not yet at their best. The superintendent and grower have done their work well, and large numbers of visitors will see the show during the next few weeks. Although numerous announcements as to the locale of the show, and its existence, are sadly needed about the park—and are, indeed, wanting in all the parks. Here, of incurved varieties, not many yet were in bloom, the best being Mr. Bunn, Jeanne d'Arc, Mr. Cobay, Prince of Wales, and Queen of England. Of Japanese forms, Mr. W. Holmes was again very prominent, for, beyond being a beautiful flower, it is an October bloomer, also Mlle. Melanie Fabre, President Hyde, Sarah Owen, John Salter, Flamme de Punch, Mlle. Lacroix, Grandiflorum, Duke of Berwick, Ilver Fleuri, Phœbus, J. R. Pearson, M. H. Jacotot, Avalanche, and Dormillon are a few of the best fully open. Amongst Pompons, Madame Elise Dordan is here, as elsewhere, very prominent. Possibly in the grouping of so large a mass of plants, some stiffness or formality is unavoidable. It would much enhance the beauty of the collection could some variations of arrangement be introduced. Some more complete system of naming is generally desirable also, as it is evident that myriads of the working-class visitors take the keenest interest in the varieties, and like to learn their appellations.

The Inner Temple.—This year visitors to the gardens of the Inner Temple will find the autumn flower nicely accommodated in a house worthy of herself, and in which there is plenty of light—such, indeed, as is vouchsafed us at this season—and where, while we admire the beauties inside the house, the outside moisture does not trickle down the nape of our neck from innumerable crevices in the roof, as of yore. There is one improvement more which we may hope for, and that is, a stage of three or four steps, commencing at, say, 6 inches from the ground, where Mr. Newton could arrange his plants in bank-like form, if he so choose, without the need there is now of putting 8-foot high stilts on his back-row plants, and nicely-graded lower ones on the others. We may live yet to see his plants of more moderate height, and furnished with nice green leaves down to the rim of the pots. It would really not be too much to hope for now that he is our "only Chrysanthemum grower" about the Temple. The collection is rich in good novelties, of the Japanese forms chiefly; indeed,

the space at command does not admit of the presence of inferior varieties. We noted flowers of the rich chestnut-crimson coloured Edwin Molyneux, a good mid-season moderately dwarf variety; the rosy-carmine Madame J. Laing, with florets just a little twisted and inclined to incurve, it is also a dwarfish variety; Mr. W. Walter, of rich purplish-chocolate, also twisted in its florets, and with an inward inclination; the American acquisition, Ada Spaulding, lower half rose shading off to white, the upper side of the florets silvery-white—a large striking flower, it would be classed as a Japanese incurved; the silvery-rose Exposition de Troyes; Madame de Sévin, a rosy-purple reflexed Japanese; Robert Cannell, a crimson and yellow incurved flower; Condor, Mons. W. Holmes, rich chestnut-red inclining to crimson, with yellow tips to the florets—a beautiful early flower; and Jeanne Marty, Japanese Anemone. Others of merit were Louis Boehmer, Marsa, Sarah Owen, Alberic Lunden, W. Stevens, Stanstead Surprise, and Mlle. Elise Dordan, an exquisitely quilled pink Pompon which everyone should possess.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

Floral Committee.

OCTOBER 14.—At a meeting held at the Royal Aquarium on the above date, a large number of new flowers was staged, blooms of the fine new incurved variety, M. A. Brahaut, being numerous. The Floral Committee award but one Certificate to a variety, and they select the blooms which show the highest state of development. On this occasion this fine variety was submitted by about one dozen growers, and the best blooms being those sent by Mr. H. Shoemith, Shirley, Croydon, the Certificate was awarded to him. This novelty is of the Queen type, large, full, broad-petalled, and finely incurved; the surface colour bright crimson-chestnut, with a silvery salmon-lilac on the reverse side.

Mr. William Wells, nurseryman, Earlswood, sent Kate Wells, dull red, tipped with gold, like a small reflexed bloom, and promising to make an acceptable decorative variety. Mr. C. Buck, gr. to M. R. Smith, Esq., The Warren, Hayes Common, sent a sport from the Japanese Carew Underwood, which the committee did not think to be sufficiently distinct from that variety. Mr. C. Cox, The Grange, Beckendon, Hertford, sent Japanese Jules Toussaint, reddish orange-brown, with silvery reverse, in the way of Madame C. Audiguier; and Japanese Secrétaire Général Cassagneau, a large blush variety—pretty, but inclined to be a flower a little coarse. From Mr. E. Rowbottom came the new American Japanese W. Tricker, delicate rose—a large, full, well-incurved flower, of great beauty, a kind of pale Mons. Freeman, yet quite distinct (First-class Certificate). Mr. P. Blair, The Gardens, Trentham, Staffordshire, sent six very fine and beautifully-finished blooms of Bouquet de Dame, a large and full flower in the way of Avalanche, but distinct from that variety, and of a pure white (First-class Certificate).

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, sent a number of new varieties, including Hetty Dean, a white sport from President Hyde, and resembling a white Cullingfordii; Japanese Madame de Croisilles, orange-cerise and crimson; M. J. Moulins, bright rosy-red—very pretty in colour, thread-like petals, distinct, very free (Commended as a decorative variety); Pompon M. A. Herlant, small, orange-brown—very compact; M. Ulrich Brunner, a bright claret-coloured Japanese, flushed with crimson, Commended for its colour, being very bright and effective; and Madame Greame, a small white Japanese.

Messrs. H. Cannell & Sons, nurserymen, Swanley, had M. R. Bahaunt, W. Tricker, M. Harry Laing (Japanese), lilac-pink, very bright, compact flowers; Rose Laing, wine-crimson, tipped with gold; Miss Stevens, a bluish-pink Japanese, Certificated some time ago; Elliott F. Shephard, Japanese, a very fine broad-petalled yellow, commended for its colour; and Madame Mezdard, a fine delicate blush Japanese—Commended.

Mr. C. Beckett, The Gardens, Aldenham House, Elstree, sent two very fine and distinct Japanese, viz., Edwin Beckett, a very fine deep yellow variety,

of great substance and finish; and Miss E. Beckett, a very fine, pure white flower, broad in the petal, and of handsome shape; both awarded First-class Certificates.

From Mr. N. Davis, Lilford Road Nursery, Camberwell, came Pompon Souvenir de Leonie Ferie, deep golden-buff, very handsome (First-class Certificate); and Pompon Vicomte Cliquot, which opens orange-red, and turns to a bright golden-buff, very handsome (First-class Certificate). Mr. R. Owen, Floral Nursery, Maidenhead, also had this variety in fine condition, and was awarded a First-class Certificate also. Mr. Owen, in addition, staged a number of new varieties, including reflexed Superbum, a golden Madame Desgranges, Japanese G. C. Schwabe, in the way of Bertier Rendatler; J. A. Nicholson, a promising cerise-coloured variety, which the Committee requested to see again, as well as Australia, deep gold, broad petalled; and Goldmine, apricot gold, which was a decorative variety, the Committee wished to see a plant of this again.

Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, had double Begonias, Laing's Picotee, white, with a Picotee edge of bright carmine; and Mrs. R. Dean, deep rose, both awarded First-class Certificates; and the same award was made to Mr. M. Pritchard, Riverslea Nursery, Southbourne, Hants, for *Shortia galacifolia*, with very handsome claret-coloured foliage; and *Veronica cypripodioides*, a small compact growing hardy evergreen species, well adapted for rockwork.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE Fifth Anniversary Dinner of this society took place at the Cannon Street Hotel on the 15th inst., H. J. Veitch, Esq., presiding, in the unavoidable absence of Mr. George Dickson, who was prevented from being present through domestic affliction. Among the principal guests were Messrs. N. Sherwood, W. H. Protheroe, Ryder, A. Veitch, J. Laing, T. Maunings, H. Turner, Firze, J. Cheal, Baker, &c. In proposing the toast of the evening, "The United Horticultural Provident and Benefit Society," the chairman alluded to the death of Mr. E. R. Cutler, the last chairman, and also of the appointed chairman, Mr. Cavendish, and he was sure the sympathy of all present would go out to Mr. George Dickson under the affliction he was experiencing. He stated that the society was founded in 1865, Messrs. Rhodes, Heale, and Baker being the founders. Mr. Cole, who was very early associated with the society, was present that evening, and Messrs. Joseph Wheeler and James George, two of the trustees; and though associated so long with the society, not one of them had ever received anything from its funds. The progress of the society had been quiet, but it had done good and select work. In 1885, the annual dinner was instituted, and that was the means of calling attention to the society, and gaining accessions of members. In 1883 there were scarcely 100 members, and a very few honorary members; in 1887 there were 213 ordinary and 12 honorary members; and at the present time they had 410 members and 53 honorary ones. As many as 69 had joined during the present year; the largest number that had ever joined in one year. Members were admitted between the ages of 18 and 25; there were two scales of subscriptions—one of 3*d.* per week, 16*s.* per week being allowed in sickness; and 6*d.* per week, the sum of 10*s.* 6*d.* being the allowance in sickness. Sick members received full pay for a period of 26 weeks, and half-pay for the same time if they continued ill. To show the value of the Benevolent Fund, he might say that the Committee had voted the sum of £20 to a member who had been ill a year, to start him in a small business. After enlarging upon the benefits members received from being connected with the Society, the chairman said its business was transacted at a cost of only £50 annually, and this included £20 paid to the secretary. He thought it to be the most economically administered society of its kind. The chairman brought his speech to a close by announcing that Mr. Geo. Dickson had sent a donation of £10 10*s.* from his firm, and would become a honorary member; also that Messrs. W. H. Protheroe, Ryder, and H. J. Cutbush would become honorary members also; Mr. Nathan Cole replied on behalf of the Society. In proposing the honorary and life members, Mr. J. Hudson, the treasurer, gave some interesting details, showing the prosperous condition of the Society.

In proposing the health of the chairman, Mr. N. Sherwood, after paying a high tribute to the interest shown by Mr. Veitch and his firm in the charitable

societies connected with gardeners, alluded to the convalescent fund for providing a convalescent home at some sea-side place, said he would subscribe a sum of £15 to the fund, and make three members of his family annual subscribers of 1 guinea each per annum.

The Chairman had a most gratifying reception when he rose to respond to the toast of his health, and said that what he was, was owing entirely to the admirable training he received under his grandfather and father. He would follow the example of Mr. Sherwood, and subscribe the sum of £25 to the Convalescent Fund, having no children of his own to make members.

The toast of "the kindred societies," proposed by Mr. R. Dean, was responded to by Mr. G. J. Ingram, the Secretary of the Gardeners' Royal Benevolent Institution. The tables were charmingly decorated by Mr. J. R. Chard, and an excellent dessert was provided by members of the Society and others.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

OCT. 20.—Manchester has done well in providing in her magnificent Town Hall a show of hardy fruits worthy of her best horticultural traditions. It does seem as if a great portion of the kingdom had been laid under contribution in order to provide illustrations for the Fruit Conference to be held to-day and to-morrow.

There were Apples and Pears from North Yorkshire, Durham, Lancashire, Cheshire, and Derbyshire; from Herefordshire, Worcestershire, Somersetshire, Sussex, Berks, Middlesex, Bucks, and, not least, Kent, and so the Manchester folk were able to see fruit from all the best fruit-growing districts of the kingdom. The Queen was also represented, by Mr. Thomas sending from Frogmore 250 dishes of superb Apples and Pears, including some seedlings. A like number of dishes were sent by Messrs. James Veitch & Sons, of Chelsea, from their nurseries at Slough and Fulham; and these, with a collection of some eighty dishes from Dicksons, Limited, Chester, filled the spacious reception-room. In the ante-room were collections from Messrs. Caldwell & Sons, nurserymen, Knutsford, and Mr. Watkins, Pomona Farm, Withington, Hereford, who sent a collection of Cider Apples.

Across the corridor is the Town Hall, and here were set forth the competitive classes. Broad stages running down the centre, and lining the sides, were laden with Apples, Pears, and Grapes; in front of the orchestra Mr. Samuel Barlow, Stakehill, had a line of small bush Apples on the Paradise stock, such as one could easily carry in their hand, but all bearing fruit from three or four to seven and eight; and in front of these was a line of superb Grapes, with plates of Tomatos forming a front line.

Messrs. R. Smith & Co., Worcester, had a large collection of Apples and Pears, and Mr. W. Crump, Madresfield Court, sent some very fine Pears and Apples, the latter richly coloured. Mr. J. Clarke, Albion Nursery, Farnham, Surrey, had a collection of well coloured Grapes grown under glass without fire-heat. Alicante, Lady Downes, Muscat of Alexandria, Gros Maroc, &c., for these an extra prize was awarded the exhibitor.

The best collection of eighty dishes was from Messrs. G. Bunyard & Co., Maidstone. They were splendid, the best collection we have seen set up this season. Mr. J. Watkins took the 2nd prize with a very good collection also, and Messrs. J. Cheal & Son, Nurserymen, Crawley, the 3rd.

Mr. J. Watkins took the 1st prize with fifty dishes of Pears, and had the following in fine character, Doyenné Boussoch, Conseiller de la Cour, Pitmaston Duchess, Flemish Beauty, Clapp's Favourite, Beurré Baltet père, Beurré Diel, Marie Louise d'Uccle, Beurré d'Ézée, said by some to be the same as Brockworth Park. Vicar of Winkfield Duchesse d'Angoulême, Beurré Bosc, Louise Bonne of Jersey, Fovelle, Jersey Gratioli, Autumn Bergamot, &c. Mr. J. H. Goodacre, The Gardens, Elvaston Castle, Derby, was 2nd with a highly meritorious collection, he had a very fine dish of Williams' Bon Chrétien, Beurré Hardy, Easter Beurré, Glou Morceau, Souvenir du Congrès, General Todleben, Van Mons' Leon la Clere, Marie Louise, &c. Messrs. Geo. Bunyard & Co. were 3rd.

The only collection in the open class for eighty dishes of Apples and Pears grown under glass, a very interesting one, came from Messrs. J. Cheal & Son, They staged fifty dishes of Pears and thirty of Apples.

In the amateur classes there was a remarkably good competition. The class for thirty-six dishes of Apples brought seven collections, and Mr. G. Reynolds, gr. to Messrs. De Rothschild, Gunnersbury Park, Acton, was 1st, with a perfect lot of Apples, in fine condition, and exceedingly bright, though a little more colour would have added effectiveness; he had splendid fruit of Mère de Mönage, Lord Derby, Hollandbury, Stirling Castle, Emperor Alexander, Tower of Glamis, Blenheim Orange, Warner's King, Annie Elizabeth, Dumelow's Seedling, Frogmore Prolific, Waltham Abbey Seedling, Lane's Prince Albert, Gravenstein, Scarlet Nonpareil, &c. Mr. J. H. Goodacre was 2nd, with a fine collection of much the same sorts; and Mr. S. T. Wright, gr. to C. L. Campbell, Esq., Glewston Court, Hereford, was 3rd.

Mr. Wright came in 1st with eighteen dishes, having some of the finest kinds for which Glewston Court is famous, and Mr. T. Parker, gr. to Mr. Evans, Moreton Court, Hereford, was 2nd. In the class for twelve dishes of Pears, in which there were eight entries, Mr. G. Goldsmith, gr. to Sir E. G. Loder, Leonardslee, Horsham, was 1st with Catillac, Pitmaston Duchess, General Todleben, Doyenné du Comice, Doyenné Boussoch, Marie Louise, Beurré Bachelier, Duchesse d'Angoulême, Beurré Diel, Marie Louise d'Uccle, &c. Mr. W. H. Bannister, gr. to W. Vincent Ames, Esq., Westbury-on-Trym, was 2nd also with very fine fruit.

In the class for thirty-six dishes of Apples and Pears grown under glass, Mr. J. Hunter, gr. to the Earl of Durham, Lambton Castle, was 1st with a fine collection, but some of the fruit so changed in character that it is difficult to recognise the varieties; Mr. J. McIndoe, gr. to Sir J. W. Pease, Bart., M.P., Hutton Hall, Guisborough, was 2nd; and Mr. Samuel Barlow, 3rd.

Three classes for Apples and Pears grown in the open, within 20 miles of Manchester, had a certain amount of interest for local planters, though the radius appeared to be a wide one. Mr. A. W. Jones, Marbury Hall Gardens, Cheshire, had the best twenty-four dishes; Mr. H. W. Browne, gr. to C. Sherwin, Esq., Ashley Hall, Altrincham, the best twelve dishes of Apples; while Mr. A. W. Jones came in with twelve Pears. Some good fruit was shown in these classes, but many are quite green, showing how the incidence of the season had retarded ripening.

Grapes were a very fine feature, and Mr. J. H. Goodacre took the 1st prize with ten bunches; he had superbly finished bunches of Muscat of Alexandria, two of Gros Colmar, grandly coloured; one each of Alwick Seedling and Muscat Hamburgh, and two of very fine black Alicantes. Mr. Geo. Reynolds took the 2nd prize with a good collection, he had Muscat of Alexandria, Gros Maroc, Alicante, Black Hamburgh, and Chasselas Napoleon, which looked like a late Buckland Sweetwater. Mr. Wright had the best three bunches of black, staging fine Alicante; Mr. J. Read, gr. to the Earl of Carnarvon, Bretby, Burton-on-Trent, came 2nd with Gros Colmar.

Tomatos were well shown in a class for six dishes. Mr. McIndoe showed some varieties of Citron and Plums; and Mr. A. J. Harwood, Colchester, had fruiting sprays of the Colchester Black Bullace, a valuable late variety, to which a Certificate of Merit was awarded.

FRUIT CONFERENCE.

The Fruit Conference was held in the Mayor's parlour, and was well attended by horticulturists generally, and by some of the more influential citizens of Manchester. The Mayor opened the proceedings by introducing, in a few well-chosen sentences, the Right Hon. the Earl of Derby. Lord Derby, in the course of his opening remarks, referred to the great social and economical importance the fruit industry had. He looked upon it as giving some little help to the depressed state of agriculture. It was everybody's interest, and the landlord's particularly, to give all such schemes, which were not of an Utopian character, a helping hand. Thousands of acres of land were unsaleable in England, and even on many lands that were rented at exceptionally low rates, the farmer had more difficulty in paying than on land of higher value more favourably situated. This state of things arose from four causes—(1), the increased facilities given to foreign nations to compete with our home produce; (2), the demand of the worker of the soil for a higher rate of wages; (3), the growing impatience of farmers and other commercial men for larger returns, and the desire to speculate in other commodities; (4), the tendency growing slowly, but surely, of the moneyed people to invest in less risky

things to yield them an adequate return. It might be asked, he said, why Manchester had been selected as the centre of a great movement, when all round about it the land was so unsuitable for yielding fruit crops. Many other counties of England grew better crops of Apples, and Pears, and Plums, and consequently it could only be because of its central position, and mainly because of the energy of the Botanical Society, who left no stone unturned to press fruit-growing as a commercial speculation before all interested people. Moreover, the demand for fruit was largely on the increase, particularly in all large towns. As to the prices realised, there was a considerable difference of opinion. Soil and climate must exercise their influence, and those who had orchards in the more favourite spots of England profited the most. In quoting from what his lordship said had been told him by one of the largest fruit farmers in Kent, he instanced Strawberries as realising a gross return of £27 per acre, or a nett profit of between £6 and £7; Currants realised £30 per acre gross, with a profit of £10 per acre; and Apples and Pears realised £25 per acre, with a nett profit of £5 per acre. But here, as his lordship pointed out, there was no return for five years after planting, which reduced the nett profits to a very small margin. Before, therefore, the fruit farmer could count upon his profits, he had to discount bad years, and bad sales when the market was glutted. He had been told that in Kent, even this season, the Plums did not realise the price of gathering and sending to market. He did not think that any landowner would throw obstacles in the way of fruit culture now—it was a little different twenty-five years ago, when land brought a much higher price, and was eagerly taken by tenants. As to the size of holdings much must depend upon the fruit tenants themselves what they have to spend upon, then it ought to be spent judiciously, and a full knowledge obtained of the best trees for the district, and how to cultivate and look after them. He rather thought the larger-sized holdings would come best out of the experiment, as they would be going on wholesale lines and have a competent staff to make the most of things. The smaller growers who grew for profit would, he feared, be in a measure handicapped, because he must pay the day labourers their hire, but they could not count upon a money-yielding crop. The great vicissitudes caused by weather, insects, and other troubles, many a time reduced the prospective income, and there could only be one end to the long continuance of such adverse circumstances. He looked with fear on borrowed money in an investment of this kind, because the rent had not only to be paid but the mortgages as well. It appeared to him where landlords were able to do it, it would be much the best plan for them to stock the orchards, charging a minimum rate of interest to likely tenants. He did not see there was need for much other legislation on the subject, as the bill that was passed, and looked into with severe scrutiny by both Houses of Parliament gave ample provision for the tenant to secure a fair remuneration for any improvements in the soil, or in any way about the tenancy. He counselled a definite understanding between parties when any lease was entered into, as the best of all means of keeping down heartburnings and dissatisfaction. Good fruit was wanted everywhere, and although these Conferences, and the papers read at them, would do an immense amount of good, there was nothing to beat hard-and-fast practice, and if practical schools were formed in the principal districts over the country, and intending fruit cultivators were to take adequate advantage of them, we should soon see something like a profitable outcome from it, because the scholars would be taught the value of soils and climate, and make their selection from the best working and most profitable Apples and Pears in commerce.

His Lordship then introduced Mr. Baillie, of Chester, who read a paper on the "Present Day Features and Prospects of the Fruit Growing Movement."

Mr. Baillie, after a few introductory remarks, said that he would deal principally with the distribution question. He said that the demand for fruit was largely on the increase, and yet it had not come within the daily food of the million. He attributed the obstruction in the way of cheaper Apples to the intervention of the middleman, the high railway rates, and so on. But he could not shut his eyes to the inferior quality of many parcels of fruit that were sent by fruit-growers to the market. It was neither picked, or cleaned, or carefully packed, and hence people at large would not buy. Their money went for foreign produce, and

therefore millions were lost to the country. He thought that a Government grant should be given to be used for fruit-gardens, either through Local Boards or County Councils, and that an inspector should be appointed to visit all infected districts, such as exists in Tasmania. He thought, also, that fruit farmers should sell by sample in the various marts, and deliver the goods as a farmer does his cereals. He also counselled the reduction of sorts; he would rather have eight good sorts than eighty, and he would recommend a succession from August to August.

Mr. Baillie agreed with Mr. Gladstone that a great commercial void was too apparent, and that something was needed of an educative character to press the matter before the general public. Under the new Technical Instruction Act he would have lectures in various places on such subjects as—how plants are fed; choice of site and preparation of the soil; kinds of fruit for different districts; pointing out the pests and parasites that are the bane of culture, and how to get them under. He recommended the leaflet issued by the Royal Horticultural Society as one that all interested in fruit farming should read.

Mr. Bruce Findlay made some observations bearing upon the paper just read. He particularly animadverted on the spent trees which were grown in many localities which were not cultivated at all, and pointed out that until growers were fully alive to the finer fruit needed, no success could be achieved.

Mr. Crump Madresfield then read his paper on "The mode of Budding and Grafting and Growing general Fruit trees for Estate plantation and for small holdings." It was only some twelve years ago since he began this sort of work, encouraged by his employer, Earl Beauchamp, and the amount of fruit grown by the industrious people on the estate was something to be proud of. He gave a thoroughly practical essay on how to manage Apples, Pears, and Plums, scouted the idea of root pruning, would have all young trees with their tap roots taken up, and instead of cross-cutting them would lay them flat in a horizontal position. In this way the trees grew better. He would not root-prune any tree at all. What he would do, by way of checking growth, was to raise the trees, and replant them, particularly those in stiff clayey soils. He looked upon the crab seedling as the best sort to graft upon; he thought that these dwarfing stocks, such as Paradise, was like working with a cripple. He grew a lot of dwarf standards as being the best to plant in the grass, and he recommended planting dwarf ones among the Hops. There is no doubt that when noblemen take up this nursery rearing of fruit trees, they are doing a vast amount of good, and, as Mr. Crump said, it did not interfere with the ordinary business of the trade, as many people seeing how the labourers managed, took to the culture as a pastime, and had their reward in good eatable fruit.

Mr. J. F. Rivers read a paper on "Orchard House Culture," dealing mainly with the growth of Peaches in pots. He had his paper illustrated with several photos, showing how plants of the kind grew under the treatment which they received. It was something, he held out, to have good Peaches in succession from 1st July to the end of October. He also touched upon other fruits, such as Pears and Cherries, and said they were beautiful objects to look upon—so much so in fact as to entice tom-tits to play havoc among them unless they were protected with netting.

Lord Derby spoke to the value of the papers that had been read, although he was not practical enough to express an opinion upon them. He said that it had been clearly established that (1) there was an increasing demand for hardy fruits, (2) that much that had in past years been imported might be grown at home, (3) that quality versus quantity should be the order of the day, and (4) that unfruitful trees of too great age and of inferior quality should be cut down and fresh plantations made.

SALE OF THE LAKE HOUSE ORCHIDS, & C—The collection of G. NEVILLE WYATT, Esq., at Cheltenham, most of the rare specimens in which were so admirably grown by Mr. SIMCOE, passed under the hammer at Mr. J. C. STEVENS' Sale Rooms, 38, King Street, Covent Garden, on Wednesday and Thursday, October 21 and 22, and realised good prices. The highest price on Wednesday—50 guineas was paid for a healthy plant of *Oncidium orthorhynchum album*. The plant was purchased from Messrs. B. S. WILLIAMS & SON, for 25 guineas, and so it stands in evidence that a good and rare plant if properly treated does not lose in value. Other prices realised

were 10 guineas for *Oncidium incurvum album*, *Cymbidium affine*, 8 guineas; *C. eburneum*, 4½ guineas; *Anthurium Scherzerianum*, Lake House, var., 9 guineas; *Lycaste Skinnerii alba*, £5 10s.; *Angulosa Ruckerii sanguinea*, £9 and £5; *Odoatoglossum Uro-Skinnerii*, £9 10s.; *O. ramosissimum*, £6; several *O. Alexandrae* at £4 to £5 each; *O. luteo-purpureum crispatum*, £5; *Laelia Wyattiana*, £3 10s.; *L. Pilcheri*, £3; *Cattleya Exoniensis*, 15 guineas. Of the books sold on the same occasion, WILLIAMS' *Orchid Album*, 9 vols., realised £11 10s.; the *Reichenbachia* up to date, £8 10s.; WARNER'S *Select Orchidaceous Plants*, 2 vols., 5 guineas; *A Monograph of the Genus Lilium*, 7 parts, 5 guineas.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.; 7, Principal Grazing, &c., District—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 17, is furnished from the Meteorological Office:—

"The weather has been extremely stormy and unsettled in all parts of the Kingdom, with heavy falls of rain in nearly all districts, and occasional thunder and lightning. Towards the end of the week the conditions improved somewhat, and some fine clear intervals were experienced.

"The temperature has been a little below the mean over Ireland and the south-west of England; but, about equal to the normal, or rather above it elsewhere; in England, S. there has been an excess of 3°. The highest of the maxima, which were registered on irregular dates, ranged from 64° in 'Scotland, W.' and 'England, S.W.', to 57° in 'Ireland, N.' The lowest of the minima were generally recorded either on the 13th or 17th, and ranged from 32° in 'Scotland, E.', 'England S.W.', and 'Ireland, N.', to 39° in 'England, S. and N.W.', and to 46° in the 'Channel Islands.'

"The rainfall has been more than the mean in all districts. In most instances the fall has been about twice as much as the normal, while in 'England, S.' it has amounted to nearly three times as much.

"The bright sunshine has been rather more than the mean in most districts. The percentage of the possible amount of duration varied from 49 in the 'Channel Islands,' and 40 in 'England, E.', to between 27 and 30 in most of the northern and north-western districts, and to 21 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, October 22.

TRADE slow, with shorter supplies. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers such as Asters, Carnations, Chrysanthemums, and their prices per bunch or dozen.

ORCHID-BLOOM IN VARIETY.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots like Adiantums, Aralias, Aspidistra, and their prices per dozen.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing various fruits like Apples, Grapes, Kent Cobs, and their prices per case or sieve.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing various vegetables like Artichokes, Beans, Beet, Carrots, and their prices per bunch or lb.

POTATOS.

In consequence of heavy rains and gales the supply continues short of the demand, and consequently best samples command advance in prices.

NOTICES TO CORRESPONDENTS.

BOOKS: Chemistry of Soils. Sir H. Roscoe's Books, the elementary and the larger work are both excellent ones.

BOUNDARY FENCE: Boundary. The outer edge of your neighbour's ditch marks probably the line dividing the properties.

CORRECTION: CRYSTAL PALACE FRUIT SHOW, Oct. 8, 9, and 10. We are requested to state that the winner of the Bunyard Prize for 3 dishes of Pears, was Mr. R. Silk, gr. to Jas. Abernethy, Esq., Margate, not Mr. W. A. Cook, Compton.

INSECTS: W. R. J. S. The small grubs sent, which, in July, attacked your seedling Sweetbriars, completely destroying the whole crop, just below the surface of the earth, and eating round the tap-root, and also causing the loss of about half a million of one-year seedling Scotch Firs, are the immature larvae of one of the small species of Cock-chaffers (Melolonthidæ).

MUSCAT OF ALEXANDRIA ON A TREBBIANO STOCK: Subscriber. The union of the two varieties would answer in so far as the one would grow well on the other, but the flavour of the Muscat might possibly be unfavourably affected in a slight degree.

NAMES OF FRUITS: Bywater. 1, Duchesse d'Angoulême; 2, Baronne de Mell; 3, Beurré de Capiaumont; 4, Maréchal de la Cour; 5, Louise Bonne of Jersey; 6, Alexandre Lambre.—S. Pick. Not Red Hawthornden; not quite sure of name.—An Old Subscriber. 1, Bellissime d'Hiver; 2, not recognised.—W. W. J. and S. Your Apple is quite unknown to us.—C. K. 1, New Hawthornden; Maréchal de la Cour.—Notts. New Northern Greening.—J. B. Leiston.—1, Beurré Diel; 2, not recognised; 3, Duchesse d'Angoulême; 4, Bedfordshire Foundling; 5, Sturmer Pippin; 6, Dumelow's Seedling.—F. M. 1, Marie Louise; 2, Bergamote d'Espéren; 3, 4, Louise Bonne of Jersey; 5, Hambledon Deux-aus; 6, Cellini.—W. T. 1, Columbia; 2, not known; 3, Bergamote d'Espéren; 4, Huyshéa Victoria; 5, Knight's Monarch. Plum quite decayed.—J. Stocks. 1, Cellini; 2, Shepherd's Newington; 3, Rymer; 4, Yorkshire Beauty; 5, Rymer; 6, not known.—B. G. 1, Swan's Egg; 3, New Hawthornden; 4, Old English Codlin; 5, Court of Wick; Beurré Hardy.—Pontypool. Urbaniste.—M. J. 1, Jalousie de Fontenay; 2, Emille d'Heyst; 3, General Todtleben; 4, Comte de Lamy; 5, Comte de Flandres; 6, Beurré Sterckmans.—H. T. 1, Red Winter Calville; 2, Souvenir du Congrès; 3, Old Russet; 4, Maréchal de la Cour; 5, Beurré Clairgeau; 6, Duchesse d'Angoulême.—Stranger. Apple highly coloured, left at our office, Emperor Alexander.

NAMES OF PLANTS: Chelsea. Physalis Alkekengi, the bladder Cherry. A hardy herbaceous perennial.—L. & G. 1 and 3, varieties of Oncidium micropogon; 2, Oncidium ornithorhynchum; a white form of which has just been sold at an auction sale at Stevens' for 50 guineas.—A. A. Next week.—N. T. 1, Asplenium bifforme; 2, Cheilanthes ledegeria; 3, Athyrium filix-femina; 4, Polystichum angulare var. proliferum; 5, Pteris longifolia; 6, Microlepia hirsuta var. cristata.—A. M. 1, Statice, probably latifolia; 2, Cassia corymbosa.—C. E. F. Cyclamen Coum.—Request. 1, missing; 2, Dracaena hybrida; 3, Nephrodium molle; 4, Dracaena marginata; 5, Xylophylla angustifolia.—P. B. Your fungi arrived in a rotten condition, with the labels detached; 5, is a Clavaria.—Rock. Viburnum opulus.—Berried Shrub (no name of sender) Viburnum opulus, Wild Guedres Rose.—J. S. Lilium nepalense, see figure in Gardeners' Chronicle, October 13, 1888.—J. H. 1, Pyrus japonica; 2, Phygellus capensis; 3, Escallonia rubra.—W. F. 1 and 2 forms of Pyrethrum frutescens; 3, Pyrethrum Soleil d'Or.—G. P. Coccoleba platycladon.—Paddy from Cork. 1, Cupressus Lawsoniana; 2, Bignonia radicans; 3, Desfontainia spinosa; 4, Adamia cyanea; 5, Leycesteria formosa; 6, Sedum spectabile.—E. P. A Ceropogia, or allied plant, which we will endeavour to name by next week.

PRIMULA JAPONICA: J. H. The grubs are those of a weevil, which is very destructive. Scatter some brewers grains about or some slices of Carrot, and so trap them; but it is rather a hopeless task.

WALNUTS: E. E. Risien, Sans Saba, Texas. The writer of the article in question resides at 16, Whittingstall Road, Fulham, London, S.W.

WORMS ON A LAWN: A. L. Mix water and quicklime together in the proportion of 3 gals. of the former to 1 lb. of the latter. After letting it stand for two days, pour off the clear water and apply it to your lawn, preferable in moist weather. The worms will come to the surface, and must then be swept up. It should be remembered that worms are the natural drainers and manurers of Grass land; and, if they are wholly destroyed, and the soil be of a heavy nature, the lawn will not be so dry on the surface as formerly.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 16, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.
Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

"Nothing Succeeds like Success."
**HUGHES' (SOLUBLE) INSECTICIDE
FIR TREE OIL**

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsmen & Chemists, 1/6, 2/6, & 4/6; 1/2-gallon 7/6, 1-gallon 12/6, or less in larger quantities.
A Treatise on FIR-TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to
E. GRIFFITHS HUGHES, Victoria-st., Manchester.
Wholesale from all the London Seed Merchants and Patent Medicine Houses.
NEW YORK—A. ROLKER & SONS.

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—*The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.*

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

FLORIST and SEED TRADE. —A young Lady having several years' experience, wishes re-engagement in above. No objection to temporary engagement.—**A. B.**, 68, Great George Street, Liverpool.

HOLLOWAY'S PILLS. —Easy Digestion.—These admirable Pills cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously relieve and steadily work out a thorough cure, and in its course dispel headache, biliousness, flatulence, and depression of spirits. It is wonderful to watch the daily improvement of the complexion, as Holloway's Pills purify the blood, and restore plumpness to the face which had lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this regulating medicine; even persons in health, or when following sedentary occupation, will find it an invaluable aperient.

SANDER

All double sheathed, and every Plant guaranteed true.

GREAT SALE OF ORCHIDS

By MESSRS. PROTHEROE AND MORRIS, ON WEDNESDAY, OCTOBER 28, 1891,

AT THE

ORCHID NURSERIES, EAST DULWICH, LONDON, S.E.

By order of Messrs. SEEGER & TROPP.

The list of plants comprising the Catalogue is most exhaustive, and we may safely claim that never before has such a rich and varied selection been offered by Auction in one day.

Please ask for Catalogue, and give it careful perusal, when it will be found all kinds are so well represented that Amateurs have the opportunity of acquiring desirable new and rare species and varieties not already included in their collections, many of them perfectly unique.

Among the numerous good things to be submitted for sale are several fine, well established, healthy specimens, now pushing their flower-spikes, of the greatest novelty among Orchid introductions of this year, viz.,

GRAMMATOPHYLLUM SEEGERIANUM.

ALSO THE FOLLOWING:—

SOBRALIA MACRANTHA KIENASTIANA, pure white
Macrantha. First-class Certificate, Royal Hort. Society.
LELIA PERRINI ALBA (not NIVEA). First-class Certificate, Royal Horticultural Society.
CATTLEYA INTERMEDIA ALBA.
PHALANOPSIS SANDERIANA ALBA.
TRICHOPILIA SUAVIS ALBA.
LELIA ANCEPS ALBA.
CŒLOGYNE CRISTATA ALBA.
LELIA AUTUMNALIS ALBA.

LYCASTE SKINNERI ALBA.
DENDROBIUM NOBILE ALBUM.
ODONTOGLOSSUM NEBULOSUM ALBUM.
ZYGOPETALUM MACKAYI ALBUM.
SOBRALIA LEUCOXANTHA GRANDIFLORA (ALBA).
VANDA STANGIANA, grandest Specimen in Europe.
CATTLEYA MOSSIE REINECKIANA, sepals and petals
pure white. [white].
CATTLEYA GASKELLIANA NIVEA, sepals and petals pure
CATTLEYA FAUSTA.

RENANTHERA STORIEI, fine specimen.
ANGRECEM GRANDIFLORUM.
CŒLOGYNE MEYERIANA (pandurata type).
MASDEVALLIA SCHRODERE, First-class Certificate, Royal
Horticultural Society.
MASDEVALLIA VEITCHI GRANDIFLORA, fine specimen.
EULOPHIA GUINENSIS.
AN.ECTOCHILUS, the leading species.
VANDA TRICOLOR CINNAMOMEA.
CYPRIPEDIUM, a choice selection. &c. &c.

The Sale will also include a splendid importation of the majestic **ODONTOGLOSSUM HASTILABIUM**, just arrived in grand order.

The whole, with a few exceptions only, will be offered **ENTIRELY WITHOUT RESERVE**, in order to make room for new importations due to arrive soon, this course being necessary, as owing to a short tenure of the premises, it is not possible to increase the house accommodation.

Plants may be viewed two days prior to day of sale, and Catalogues obtained on the premises; also of the Auctioneers, Messrs. PROTHEROE AND MORRIS, at their Central Sale rooms, 67 and 68, Cheapside, London, E.C.

THERE WILL BE ON EXHIBITION THE FINEST SPECIMEN CATTLEYA IN THE WORLD.

The nearest Railway Stations, in their order, are:—East Dulwich, Denmark Hill, Herne Hill, Lordship Lane, and Peckham Rye.

TOTTENHAM, N.

The Hale Farm Nurseries, adjoining the Tottenham Hale Station, Great Eastern Railway.

GREAT ANNUAL SALE.

Immense Quantities of NURSERY STOCK, by order of Mr. THOMAS S. WARE.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, as above,

On TUESDAY NEXT, November 3,

At 11 o'clock punctually, in consequence of there being upwards of 1500 lots, immense quantities of exceptionally well grown NURSERY STOCK, as previously advertised. Amongst the principal items, the following may be mentioned:—

- 30,000 Named CARNATIONS and PICOTEES, comprising all the finest varieties.
- 10,000 HOLLYHOCKS, 10,000 PYRETHRUMS, 25,000 CLEMATIS, and others, fine and strong plants.
- 2500 AMPELOPSIS VEITCHII, 6000 HEDERAS, of sorts, 5000 LILIES, &c., including extraordinarily fine home-grown sorts of the best varieties; choice named NARCISSUS, IRIS, and others.
- 50,000 Berlin CROWNS of LILY OF THE VALLEY, fine forcing crowns, all the true German variety.
- 5000 SPIREA COMPACTA, MULTIFLORA. All-o thousands of the common variety.
- 3000 CHRISTMAS ROSES, Large Forcing Clumps, full of flower-buds.
- 10,000 Forcing Plants and Bulbs.
- 100,000 SEAKALE and ASPARAGUS, Exceptionally fine ROSES.

50,000 PERENNIALS

Also ROSES, ORNAMENTAL TREES, and SHRUBS, in great variety.

The attention of the Trade and Private Buyers is particularly invited to this important Annual Sale. The Catalogues are now ready, and will be found to contain one of the most varied and extensive Stocks ever submitted to Public Auction. Copies will be forwarded on application to Mr. T. S. WARE, on the Premises; or to the Auctioneers and Valuers, 67 and 68, Cheap-side, London, E.C.

NOTE.—The Auctioneers will be pleased to purchase any lots for those who cannot attend the Sale, and Mr. Ware will undertake to pack and forward purchases to all parts of the kingdom.

Tuesday next.—Japanese Lilies.

The first consignment this season, consisting of 100 cases, and comprising,

- 4400 LILIUM AURATUM, including about 300 extra large Bulbs;
- 1600 LILIUM SPECIOSUM RUBRUM and ALBUM;
- 1000 LILIUM LONGIFLORUM.

MESSRS. PROTHEROE AND MORRIS beg to announce that they will include the above important consignment of JAPANESE LILIES in their SALE by AUCTION, at the Rooms, 67 and 68, Cheap-side, E.C., on TUESDAY NEXT, November 3, at 11.30 o'clock precisely. On view morning of Sale, and Catalogues had.

Dutch Bulbs.—Great Unreserved Sales.

EVERY MONDAY, TUESDAY, WEDNESDAY, THURSDAY, and SATURDAY.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Rooms, 67 and 68, Cheap-side, London, E.C., FIVE DAYS WEEKLY, as above, at half-past 11 o'clock each day, LARGE CONSIGNMENTS of first-class HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other BULBS from HOLLAND. Lot to suit the Trade and Private Buyers. On view morning of Sale, and Catalogues had.

Wednesday Next.

200 AZALEA INDICA and 100 CAMELLIAS, selected varieties; and 100 AZALEA MOLLIS, from one of the best growers in Belgium.

MESSRS. PROTHEROE AND MORRIS will include the above consignment of plants in their SALE on WEDNESDAY NEXT.

On view morning of Sale, and Catalogues had.

Wednesday Next.

CYMBIDIUM BICOLOR, a most beautiful

CYMBIDIUM, from Ceylon.

Also a BURLINGTONIA SPECIES, of promising appearance, from a new district.

Also a fine lot of DENDROBIUM MCCARTHLAE.

Also a CYPRIPEDIUM SPECIES, from a new district in Java, long green leaves upwards of 2 feet in length.

And quantities of other ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.

SANDER

Has just received 1000 grand Plants of the

OLD LABIATA,

Among them being 100 enormous specimens.

The masses are truly astonishing and marvellous, some of them over 6 feet in circumference.

ENORMOUS BULBS,

COLLOSAL LEAVES,

TITANIC SHEATHS.

EVERY PLANT IS WARRANTED TRUE.

"THE OLD LABIATA."

Re-discovery of the supposed long-extinguished OLD AUTUMN-FLOWERING TYPICAL CATTLEYA LABIATA.

All the Plants have double sheaths, some green, others red; flower seats, four, five, and six. This is Lindley's original Labiata.

CATTLEYA LABIATA (LINDLEY).

From Swainson's hunting grounds. This Plant was first introduced by Swainson in 1818, and he actually used its stems in packing his Lichens for transport. When first seen in flower by Dr. Lindley it created a sensation, and he named it in honour of Mr. W. Cattley, of Banet, the foremost Orchid amateur of his time.

"It is the Queen of Cattleyas, We guarantee it true."

The Plants are in magnificent order and condition. They could not possibly be finer.

"The easiest Cattleya grown, The freest-flowering Cattleya known, The varieties are endless."

CATTLEYA LABIATA (LINDLEY).

Was discovered by W. Swainson in 1817, and since that year several small consignments have arrived in Europe. In about 1830, Mr. Horsfall, of Liverpool, received some through a captain of one of his ships. Again, in about 1845, some plants came to Europe, and in 1852 Mr. Bartlett, of the Zoological Gardens, London, received a small consignment, and he disposed of it to Mr. R. S. Williams, of Upper Holloway, and two years ago a gentleman in Paris received an importation. The full history of the Plant will shortly appear in the "Reichenbachia." We have succeeded in securing the quantity offered, and the whole in grand health, and just received.

The old Labiata is a free-doing Cattleya, and makes rapid growth, and is unequal for cut flower purposes and grandeur of variety as a selling plant.

The above will be SOLD by AUCTION by

MESSRS. PROTHEROE AND MORRIS at their Central Sale Rooms, 67 and 68, Cheap-side, London, E.C., on FRIDAY NEXT, November 6, 1891, at half-past 12 o'clock, together with other new valuable ORCHIDS. On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL on FRIDAY, November 6, by order of Mr. F. Sander, CAPASETUMS of various kinds from the Rio Pinto Mountains, the home of Swainson's OLD LABIATA.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL on November 6, by order of Mr. F. Sander, EPIDENDRUM WATSONII (provisionally named). A distinct and remarkable plant, another introduction from the home of the old Labiata. The plant is provisionally named in honour of Mr. Watson, of Kew, who was much struck with the appearance of the plants.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, A. SCHOMBURGKIA, from the woods of the old Labiata.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, A NEW VANDA, VANDA O'BRIENIANA. Preserved flowers of which will be on view.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, TWO DISTINCT-LOOKING EPIDENDRUMS from Swainson's hunting ground. One of which greatly resembles in appearance EPIDENDRUM RANDII.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, DENDROBIUM RICHARDII, a most beautiful Dendrobe, of stately habit and easy culture. Flowers dark yellow with crimson lip. See dried flowers.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY, November 6, by order of Mr. F. Sander,

VANDA ROBERTSIANA, NEW, flowers white and chocolate, striped and spotted crimson.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, A DENDROBIUM, like Lælia anceps Sanderaana; flowers large, pure white, with a crimson lip.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL, on FRIDAY, November 6, by order of Mr. F. Sander, a magnificent importation of a CATTLEYA from the Rio Pinto—found with the OLD LABIATA—the plants are not unlike C. Schobelliana in growth, but the sepals and petals are said to be white, while the lip is crimson. This description Mr. F. Sander believes to be correct.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE, on FRIDAY NEXT, 100 DISA SPATHULATA,

a most extraordinary species, with white, blue, and rose flowers. The lip is a wonderful development, consisting of a long slender stalk, with a tri-lobed blade at the tip, resembling an old-fashioned spear. The tubers are true, having been collected in flower.

100 DISA FLEXUOSA.

An elegant species, never before imported. Sepals pure white, lip and petals rich golden-yellow.

Also DISA POLYGONOIDES, orange-scarlet; D. RACEMOSA, crimson; D. LONGICORNU, the broad-leaved large blue Disa; DISPERIS CAPENSIS, rose to purple, offered for the first time; and various other DISAS, SATYRIUMS, and other CAPE TERRESTRIAL ORCHIDS.

On view morning of Sale, and Catalogues had.

CAUTION.—In the Court of Session, Scotland. SUTTON and SONS v. BAXTER.—NOTICE IS HEREBY GIVEN, that the Court has granted a PERPETUAL INJUNCTION, with costs, against the defendants, Messrs. John Baxter & Sons, Printers and Publishers, Edinburgh, restraining them from infringing the Copyright of Illustrated Catalogues published by Messrs. Sutton & Sons, Seed Merchants, Reading. The defendants allege that they bought the electrotype illustrations from A. Blanc, engraver, of Philadelphia, U.S.A. As numerous infringements of the illustrations in Messrs. Sutton & Sons' several Catalogues have been made, they give Notice to all engravers, printers, seedsmen, and other persons, not to print, publish, or circulate any illustrations copied from their copyright catalogues, and that legal proceedings will be taken against any person infringing their rights. Dated this October 23, 1891. PLUNKETT and LEADER, 60, St. Paul's Churchyard, London, E.C., Solicitors for Messrs. Sutton & Sons.

J. J. CLARK, Market Gardener, Goldstone, Brighton.

GARDEN BULBS, ROSES, &c.

FOR WHATEVER IS WANTED, mentioned or not in these columns, please to write immediately to H. CANNELL & SONS, whose SEED and NURSERY STOCK is very complete and extensive, and where nearly everything for the Garden is grown and supplied in large quantities, in the finest possible condition, at the lowest prices consistent with correctness and superior character. Never has there been such a complete Autumn Catalogue issued of everything required for the garden as the one we are now sending post free; neither has there ever been such a splendid stock of best varieties of the many families of plants necessary to keep the garden in the highest state of perfection as we are now soliciting orders for. Our climate, soil, and facilities give us and purchasers many advantages, and we ask all to send for a Catalogue, and then

H. CANNELL & SONS,
SWANLEY, KENT.

AUTUMN and WINTER PRUNING.

TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S Celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTICUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Illustrated CATALOGUES can be had, post-free, from the PATENTEES and MAKERS, at their works and depot, ST. ALKMUIND'S CHURCHYARD, DERBY; or of the principal Ironmongers and Seedsmen, the leading stores, and kindred trades throughout the world.

STREPTOCARPUS, NEW HYBRIDS. VEITCH'S STRAIN.

*Award of Merit for the Strain, Royal Horticultural Society's Exhibition, May 29, 1891.
Four Certificates of Merit, Royal Botanic Society's Exhibition, April 22, 1891.*

JAMES VEITCH & SONS

Beg to direct special attention to this **STERLING NOVELTY** :—

THIS beautiful new race of **STREPTOCARPUS** originated at the Royal Gardens, Kew where Mr. Watson crossed *S. Rexii* and *S. parviflorus* with *S. Dunnii*, and raised several charming new varieties.

From the numerous complimentary letters which reach us respecting the very satisfactory results obtained from the seed distributed last season, and the favourable comments of the Horticultural Press, we feel sure that these hybrids have a splendid future. The results of last year's work upon these has been to give us larger and more expanded flowers, and a considerably increased proportion of the rarer and the brighter colours, particularly among the rose, rosy-purple, reddish, and magenta shades; and from the seed now offered, which has been further hybridised, many entirely new and striking varieties may be confidently expected.

The plant is a greenhouse perennial, of dwarf, neat habit, growing about 9 inches high, with rather long, narrow, arched and recurved stemless leaves.

These new hybrids are remarkable for their abundance of bloom, and the continuous succession in which the flowers are produced for about four months in the summer and early autumn, and also for the long time the individual flowers last in perfection.

The flowers, which are very graceful in form, are trumpet-shaped, widely open, and slightly recurved at the mouth, and measure about 1½ inch in length. They are generally produced in a horizontal or semi-upright position, thus displaying their full beauty.

The variation of colours in these new hybrids is very striking, scarcely two plants being exactly the same, and the colours range from pure white, through pale lavender, lavender-blue, lilac-blue, light mauve, purple, violet, bright rose, and red to rich rosy-purple, with all the intermediate tints, and in all the flowers the throat and three lower segments are more or less marked or splashed with long blotches or spots of various shades of purple, generally shaded and relieved with white, which greatly enhances the effect, and affords a pleasing contrast of colour.

If seed is sown the end of January and February, the plants come into bloom the following June and July, and continue flowering freely until the end of September and October.

Per Packet, 2s. 6d.

PRICE TO THE TRADE ON APPLICATION.

The above illustration is taken from the photograph of a plant growing in our Chelsea Nursery.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON.

ODONTOGLOSSUM CRISPUM ALEXANDRÆ.

BEST (PADRO) VARIETY.

GUILLERMO KALBREYER begs to offer the above well-known and justly-prized Orchid at the following prices, free on board of Royal Mail Company's steamers, at Savanilla :—£40 per 1000 good and healthy pieces.

G. K. also can supply :—

ODONTOGLOSSUM LUTEO-PURPUREUM,
" **CUSPIDATUM PLATIGLOSSUM,**
£36 per 1000.

EVERY PLANT IS WARRANTED TRUE.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 31, 1891.

ON TREES AND SHRUBS IN
LARGE TOWNS.

THEIR SELECTION AND CULTIVATION.

THE desirability of planting trees, more or less, in and around our large towns is, I think, now universally admitted. The contention that the introduction of trees occupies space already overcrowded, impedes the circulation of the air, and minimises the light of heaven, will not bear the test of examination. No sane person would advocate the planting of every square yard of ground in a town or city, nor would he recommend planting so closely as to shut out the light or impede the circulation of the air. One great fact in favour of the practice is, I think, the influence of active tree life in purifying the air, and rendering it healthier and more suitable for human consumption.

It would seem, then, that the practice can be upheld on the grounds of utility alone, but the sum and substance of human life are not bounded even by that comprehensive word utility; within its just limits, too, there is the shade and shelter to enjoy, the eye to please, and the mind to exercise and soothe, and what is more likely to attain these ends than the introduction of beautiful trees, with their varied leaves and flowers, amid the dingy and monotonous masses of town buildings. It has always seemed to me that the introduction of trees to towns should be regarded by the inhabitants as a forecast of work in the interests of health and enjoyment, and they may be so managed as not to interfere with convenience or comfort either in the present or the future.

The subject seems fairly open to discussion under the following heads:—1, What to plant; 2, The selection of individual trees; and 3, How to plant and cultivate them.

1. With regard to "what to plant," we have but little to guide us beyond the knowledge derived from observation and experience. We know that certain trees flourish in certain towns—take the Plane tree in London as an example—whereas another tree, similar in appearance to the ordinary observer, languishes, and a third quickly dies. I have never yet met with a complete solution of this problem, nor am I prepared to offer one. I can only suggest probable causes. We know that some trees thrive best in a heavy soil, some in a light one; some in a dry soil, some in a moist or wet one; some like a warm climate, some a cold one. We know that trees derive their nourishment partly from the soil through their roots, and partly from the air through their leaves—trees breathe and perspire

through their leaves. The leaves are furnished with numerous pores or openings on both their surfaces, through which the functions of breathing and perspiring are carried on. These openings vary in size and number in different species of trees and plants. This variation may probably account in some measure for certain trees sustaining better than others the effects of living and breathing in an impure atmosphere. Again, it may be that the digestive organs of some are stronger, or less unfavourably influenced than others by bad air. And here I would remark that by bad air I do not mean simply fog and smoke, bad as those are, but air further polluted by the noxious gases constantly streaming into it from various chemical works which exist in most large towns. I witnessed lately a case which illustrates this remark. A row of Aucubas had flourished for years in a large town, despite of smoke and fog, but perished shortly after a manufactory of chemicals was raised near to them.

The Plane tree (*Platanus orientalis* var.) grows well in London and some other large cities and towns in England, where the Chestnut, the Larch, and others are not quite satisfactory, and where the Coniferae, with the exception of the *Pinus austriaca*, and the *Cupressus lawsoniana*, will hardly grow. But the Plane tree does not do well everywhere, which, on generalising from a number of isolated facts, would seem to be due either to soil or climate. However this may be, we cannot, in the present state of our knowledge on this subject, do better than trust to observation and experience by planting in each district those trees and plants which we know do well there.

The least observing cannot fail to have remarked that in smoky districts deciduous trees thrive better than evergreens. This is probably due to the former dropping their leaves every autumn, and renewing them every spring, which the latter do not; their leaves remain on the trees, their pores becoming choked with sediment from the air, and healthy action consequently impeded. Deciduous trees and shrubs should, therefore, abound in all town plantations.

Guided principally by observation and experience over a somewhat extended surface of country, and a lengthened period of time, I have ventured to compile the following list of trees and shrubs suitable for plantations in large towns. For the smaller towns with open surroundings, this list may be considerably extended.

Deciduous Trees exceeding 12 feet in height when full grown.

- | | |
|--|---|
| <i>Acer pseudo-platanus</i> | <i>Liriodendron tulipiferum</i> |
| " <i>purpurea</i> | <i>Ornus europaea</i> |
| " <i>dasycarpum</i> | <i>Platanus occidentalis</i> |
| " <i>macrophyllum</i> | " <i>pyramidalis</i> |
| " <i>platanoides</i> | <i>Populus alba, canadensis nova,</i> |
| <i>Ailanthus glandulosus</i> | <i>fastigiata monilifera</i> (the |
| Alms of sorts | black Italian), and a most |
| <i>Amelanchier botryopium</i> | any other |
| <i>Amygdalus communis</i> | <i>Pyrus aria</i> |
| <i>Betula alba</i> | " <i>auroparia</i> , and many |
| <i>Catalpa syriacifolia</i> | others |
| <i>Carya</i> of sorts | <i>Rhus typhina</i> |
| <i>Crataegus coccinea corallina,</i> | <i>Robonia pseudo-Acacia</i> , and |
| <i>grandiflora</i> — Paul's new | any other (a good town tree |
| double scarlet, fl. pleno (the | in sheltered places, but very |
| double pink), <i>stricta pentagyna</i> , | brittle and easily broken with |
| and almost any | the wind) |
| other free grower | <i>Subserbia adiantifolia</i> |
| <i>Cytisus Laburnum</i> | <i>Salix vitellina babylonica</i> , and |
| <i>Fagus sylvatica</i> | many other Willows |
| " <i>purpurea</i> | <i>Sophora japonica</i> |
| <i>Fraxinus excelsa</i> | <i>Tilia europaea</i> |
| " <i>pendula</i> | <i>Ulmus latifolia, stricta, mon-</i> |
| <i>Gleditsia triacanthos</i> | <i>tana</i> , and its vars <i>glabra,</i> |
| <i>Juglans regia and nigra</i> | <i>pendula</i> , and <i>vegeta</i> |
| <i>Liquidambar styraciflua</i> | |

Deciduous Flowering Shrubs under 12 feet when full-grown.

- | | |
|---|--|
| <i>Azalea</i> , in variety | <i>Philadelphus coronarius</i> , and |
| <i>Berberis vulgaris</i> , fol. <i>pur-</i> | many other varieties |
| <i>pureis</i> , and many others | <i>Rhus Cotinus</i> |
| <i>Coutea arborescens</i> | <i>Ribes sanguineum and aureum,</i> |
| <i>Cornus alba, mas</i> , and many | and many others |
| other varieties | <i>Sambucus aurea nova</i> , and |
| <i>Cydonia japonica</i> | many others |
| <i>Euonymus</i> , in variety | <i>Spiraea</i> , in variety |
| <i>Forsythia viridissima</i> | <i>Symphoricarpos racemosus,</i> |
| <i>Fuchsia Riccartoni</i> | <i>vulgaris foliis variegatis</i> |
| <i>Hibiscus syriacus</i> , in variety | <i>Syringa</i> , the <i>Lalac</i> , in variety |
| <i>Hypericum Kalmianum</i> | <i>Weigela rosea</i> , and many |
| <i>Lycasteria formosa</i> | others |
| <i>Ligustrum vulgare, variegat-</i> | <i>Viburnum opulus sterilis</i> , and |
| <i>tum</i> , and others | many others |
| <i>Louicea Ledebourii</i> | |

- Evergreens.*
- | | |
|---|---|
| <i>Aucuba</i> , in variety | <i>Mahonia japonica</i> and <i>aqui-</i> |
| <i>Berberis dulcis</i> and <i>Darwinii</i> | <i>folia</i> |
| <i>Buxus Handsworthiana</i> , and | <i>Osmanthus ilicifolius</i> , <i>O. varie-</i> |
| one or two other broad- | <i>gatus</i> , <i>O. rotundifolius</i> (good |
| leaved varieties | town plants, but very brittle, |
| <i>Cotoneaster Simonsii</i> , and | and liable to get broken by |
| others | heavy snow) |
| <i>Daphne pontica</i> | <i>Olearia Haastii</i> |
| <i>Euonymus japonicus, radicans</i> | <i>Phillyrea</i> of sorts |
| <i>variegata</i> | <i>Rhamnus Alaternus</i> |
| <i>Hypericum calycinum</i> | <i>Skimmia japonica</i> and <i>oblata</i> |
| <i>Ilex aquifolium</i> (common | <i>Viburnum tinus</i> |
| green and any other smooth- | <i>Vinca elegantissima</i> , and |
| leaved free growers) | others |
| <i>I. a. speciosa</i> (Golden Queen) | <i>Yucca</i> , any variety |
| <i>aurea pumila</i> , and some few | <i>Veronica Traversii</i> |
| others | <i>Kalmia</i> , in variety |
| <i>I. a. Silver</i> , <i>albo marginata</i> - | <i>Taxus baccata</i> , <i>Crowderii,</i> |
| and some few others | <i>elegantissima, fastigiata,</i> |
| <i>Ligustrum ovalifolium, ovali-</i> | and perhaps others |
| <i>folium variegatum</i> | Common <i>Rhododendrons</i> |
| " <i>lucidum</i> and <i>japonicum</i> | <i>Cupressus Lawsoniana</i> |
| | <i>Pinus austriaca</i> |

- Climbing Plants*
- | | |
|--|-------------------------------------|
| <i>Ampelopsis hederacea</i> | <i>Lycium europaeum</i> |
| " <i>Veitchii</i> | <i>Menispermum canadense</i> |
| <i>Clematis flammula</i> , and some | <i>Passiflora corulea</i> |
| others | <i>Periploca graeca</i> |
| <i>Hedera</i> (the Ivy), all the free- | <i>Vitis riparia</i> (sweet-scented |
| growing sorts | Vine) |
| <i>Jasminum officinale</i> | <i>W. Paul, Waltham Cross.</i> |

(To be continued.)

FIG. 67.—THE SEED VESSEL OF ARISTOLOCHIA ELEGANS, WITH SEEDS.

ARISTOLOCHIA ELEGANS.

In 1885 (September 5, p. 301), we had the pleasure of describing for the first time, and of illustrating, a new species of *Aristolochia*, introduced by Mr. Bull, and which is now a general favourite for conservatory decoration, being attractive alike in colour and form and destitute of the offensive odour common to its fellows. In order to render our story complete, we add an illustration of the seed-vessel as sent by Mr. Burbidge. It is of a dark brown colour, and the seeds have a narrow wing. For the rest, the drawing tells its own tale.

TREES AND SHRUBS.

SOPHORA JAPONICA.

This fine species was introduced from China in 1763, and although it has proved itself to be hardy even in the north of England, it is rarely seen in gardens. The *Sophora* forms a large-headed tree of 50 feet high, with wide spreading branches, pinnate

leaves of a rich glossy green, and pea-shaped creamy-white flowers borne very freely in terminal panicles which last three weeks in perfection. It will grow in almost all kinds of soils and position, but preference should be given to open and sunny spots. It is a capital tree for town planting, standing smoke well and retaining its foliage even in very dry weather, although it may not flower quite so freely as in the country. The tree retains its leaves till most others are shed. It is propagated by imported seeds obtained from the warmer parts of France. There are fine specimens at Kew and in the Oxford Botanic Garden, as well as at Fulham Palace.

SOPHORA JAPONICA PENDULA.

This is a handsome weeping half tree or big bush that is seen to the best advantage when worked on stems of *Sophora japonica*, 10 to 14 feet high. Grafting should be done in the month of March in the open air, the scions used being of the last season's growth, and well ripened, which is a very important point. Tongue-grafting will be found to answer well, although wedge-grafting is a useful and simple method, covering the grafts with the usual clay and horse-droppings mixture, or better still, with grafting wax. In three weeks or a month they must be looked over, and those that have grown should have the matting loosened, later on removing it altogether. It is an excellent water-side plant, and delights in full sunshine. H.

THE HIGHLAND AZALEA (A. PROCUMBENS).

This pretty evergreen shrub is indigenous to many of the alpine districts of Europe and North America, and in Scotland I have found it in the Braemar Highlands at an elevation of about 3000 feet above sea-level, where in many cases it grows in company with the Crowberry (*Empetrum nigrum*), Wild Thyme (*Thymus calamintha*), and other hardy mountain plants. By some botanists it is referred to the genus *Loiseleuria*, but is best known as *Azalea procumbens*. It thrives best on dry sandy soil mixed with a small quantity of peat or thoroughly decomposed organic matter; it only attains a few inches in height, and forms a dense carpet-like appearance to the surface of the ground where the plants get established. In early summer it produces its beautiful pink-coloured bell-shaped flowers in great abundance, which make a fine contrast with its bright green-coloured elliptic-shaped leaves. It is a grand plant for the embellishment of rockeries, and other places where space is but of limited extent; and now that the planting season is at hand, amateurs should keep this in view when renovating their small gardens. I need hardly say that thorough drainage is indispensable, and in cases where the soil is of a close adhesive texture, mix a little sand and thoroughly decomposed vegetable matter with the staple to give porosity. This, as well as many other evergreen shrubs, may now be planted out where they are to remain, with perfect success.

With the exception of *Azalea amœna*, most of the oriental evergreen species of this tribe of shrubs are too tender for the climate of Great Britain, and even *A. amœna* in some parts of the country requires protection. I have, however, grown this beautiful species for many years in Ireland without any protection whatever. This species grows in any ordinary texture of soil, providing it is thoroughly drained, well broken-up, and pulverised previous to planting. When well-established, they generally begin to produce their rich rosy-coloured flowers in April, and when the plants are in health they continue to produce, their pretty blossoms for a considerable space of time. The contour of this *Azalea* is that of a round-headed little bush, well furnished with leaves of a dark-green colour, which, in a great measure, render it attractive and ornamental all the year round. When planting groups of hybrid *Rhododendrons* here and there in the park or lawn, *Azalea amœna* may be introduced here and there in the first rank of plants around the margin with the most happy results. Many of the *Rhododendrons* produce their flowers about the same time as the former, and when the plants are well arranged as to size, shape,

and colour of blooms, the effect produced is one of no mean order. This Azalea is by no means a bad town plant, and it has this advantage—that with a little cultural care it can be grown as a pot plant for the embellishment of windows, halls, and greenhouses. When amateurs use the plants for this purpose, they should be careful to plunge the pots containing them into the soil after they have done flowering, where they should be allowed to remain till autumn, when they may then be lifted and placed under glass, to accelerate the formation and production of their flowers. By this mode of treatment, the plants often exhibit a complete mass of flowers by the month of January, and I need hardly say that they are highly attractive and fascinating at that particular season of the year. As a small standard shrub for the embellishment of small gardens, this pretty Azalea is highly suitable, and may be grown as such on the grass-plot, or mixed up with others, to show contrast and variety. *J. B. Webster.*

TROLLIUS—GLOBE-FLOWER.

BELONGING to the extensive natural order of Crowfoots, and being among the best of our spring-flowering perennials, these flowers should have more attention than they are generally accorded. One of the chief useful qualities of the Globe Ranunculus, as this flower is also often called, is the fact of its flowering at a period intermediate with the early spring bulbs and the general show of early summer-flowering plants. The present is the best of all seasons for increasing the stock of this, and therefore these few notes may not be deemed out of place, although the plants are not in flower at the present date. There are two methods of propagating these, either from seed, or division at the roots; both of these are best seen to at once. Seed is slow to germinate, and consequently should be sown as soon as ripe; this is the only satisfactory way of treating such subjects, as when the seed is kept for a few months after becoming well ripened, it is often from eighteen months to two years before it commences to grow. This is the case with many subjects, such as Gentians, &c.

Globe-flowers are best when transplanted into fresh ground about every third or four year, and this operation gives a splendid and seasonable opportunity for propagation by dividing the roots. They may be divided into almost any number, and if done early in autumn, they will do much better as a general rule than when left until spring before being divided or transplanted. A deep and rich soil—not too porous—is the finest compost for these very useful and pretty perennials; they love a fair amount of moisture, and, when in full growth, if the weather is at all dry, they will benefit greatly from a good root-watering. They are hungry-feeding plants, and applications of liquid manure are well repaid. The flowers of Trollius are produced upon spikes about 2 feet high, and are usually of a deep yellow or golden-orange colour. Not only are the flowers very pretty, but the whole combination of the plant is very ornamental, and forms one of the chief beauties of the herbaceous border. They are also suitable for planting-out among mixed shrubberies in the same way as Dahlias, Delphiniums, &c. Unlike the two flowers named, and many others, Globe-flowers do not need any unsightly sticks for their support, and have a far more pleasing appearance on account of this. They are among the most hardy plants we have, free-flowering, and of a vigorous constitution; they are also most useful for cut flowers, as they can be removed from the plant with long stems, a most desirable feature in all decorative work. Seed should be sown in boxes or pans, and placed in a cool frame; a good plan is to lay a shaded sheet of glass over the whole, this will be a great help in preventing evaporation, and as the seed is a long time germinating, it is well to be very careful in keeping the soil of a sufficient moistness without frequent waterings. If treated in a liberal manner, the young plants will commence to bloom during their second year, and will be in perfection during

their third and fourth seasons. There are a great number of named kinds now grown, and many differ very slightly one from another, so much so as to become confusing; in fact, some are no more than the same species under a poorer or richer mode of treatment in different localities. *A. P.*

A MONSTROUS CYPRIPEDIUM.

MESSRS. SANDER of St. Albans, obligingly forwarded us, a short time since, a shoot of a Cypripedium which had apparently tried to be a flower, as the frog tried to be an ox. In any case, the leaf had a white ground, traversed by purple streaks (see fig. 68), as in the dorsal sepal. It is an interesting case showing the essential identity of the parts of the flower and the leaves.

FIG. 68.—A MONSTROUS CYPRIPEDIUM: LEAVES WHITE, STREAKED WITH PURPLE.

ORCHID NOTES AND GLEANINGS.

ORCHIDS IN FLOWER AT HIGHBURY.

A VERY grand display is now to be seen in the flowering Orchid-house at Highbury, near Birmingham, which I had the pleasure of inspecting in company with the Right Hon. J. Chamberlain, the owner. Arrayed artistically with Adiantums and other fine plants, the following species and varieties were observed in bloom; the houses here are fitted with the electric light, and the effect at night is said to be charming:—

Aërides Lawrenceæ, *Barkeria elegans*, *B. spectabilis*, and *B. cyclotella*; *Cælogyne Massagiana*; *Calanthe veatrifolia*, and *C. Textorei*; *Cattleya chrysoxa*, *C. Dowiana*, *C. Dowiana aurea*, *C. maxima*, several well-flowered plants, six flowers on a spike; *C. Gaskelliana*, many distinct forms; *C. Warocqueana*, some grand and extraordinary fine forms; *C. Harriarioniana*, good; also *Cypripedium Sedeni*,

C. Schlimii, and *C. bellatulum*. Many fine and distinct forms of *Dendrobium phalaenopsis*, and *D. Statterianum*, good examples of cultivation, a charming addition to this numerous family, and grand as seen here suspended in baskets, *D. superbiens* was good; it is a species that lasts a long time in good condition. *D. biggibum* was also grand; *D. formosum giganteum*, several fine forms; *D. longicorne* and *rhodostoma*; *Dendrochilum Cobbianum*, or *Platycleris Cobbianum*; *Epidendrum vitellinum majus* (always showy); *Lælia Dayana*, *L. punila*, *L. præstans*, and *L. Perrinii*; *Lycaste nivalis*, *L. Skinneri*; *Masdevallia Davisii*, *M. amabilis*, and the fairy white-flowered *M. tovarensis*; *Mesospinidium volcanicum*, *Miltonia spectabilis*; *Oncidium aurosum*, *O. albo-violaceum*, *O. Forbesii*, grand var.; *O. incurvum*, and others; many *Odontoglossum Alexandræ*, *O. grande*, well-flowered plants, one having eight flowers on a spike, and three and four spikes on a plant—these were examples of good cultivation; *O. cirrhosum*; *O. Insleyii splendens*; *O. Rossii*, many distinct forms; *O. papilio*, and many *O. Pescatorea*, one of the latter showing particularly fine branched spikes; *Phalaenopsis violacea*, and the pretty *P. Esmeralda*, were observed. The *Pleiones* were also charmingly in flower; *Vanda cœrulea* and *V. Kimballiana*, the latter a valuable addition to this fine family, and like *V. Amesiana*, it comes into flower at a late season. All of these enumerated are now in flower, and at a later date a grand treat is in store, the innumerable quantity of sheaths upon the *Cattleyas*, *Calanthes*, *Odontoglossums*, and *Lælias*, promising a very fine display. Upwards of 200 spikes were noted on the fine white *Lælia anceps* and the beautiful white *L. autumnalis*. This collection is, I think, much improved since Mr. Burberry came to Highbury.

While on this subject, I should like to say a word respecting the much-disputed and talked-of *Cattleya Warocqueana*, that it is a grand Orchid, coming on, as it does, at this season of the year, and, like *Dendrobium Phalaenopsis Statterianum*, is a valuable addition to late-blooming species. That *Warocqueana* will vary considerably is certain from what I have seen of the Highbury collection, and of imported plants bought last year. There is in flower at the present time a fine variety of this plant with three large flowers identical in every way with the true old autumn-flowering *Cattleya labiata*, which, hitherto, has been extremely rare. *Alfred Outram, Victoria and Paradise Nurseries, Upper Holloway, London, N.*

LÆLIA PRÆSTANS.

This is a dwarf evergreen plant, which, from growing at considerable elevations, must not be placed in too high a temperature; in fact, we have observed that during the summer months the plant succeeds well in the warm end of the *Odontoglossum*-house, hung up close to the roof-glass, but shaded from the direct rays of the sun during the hottest part of the day. During the growing season, it delights in an abundant supply of water to its roots, but the drainage must be in good working order, so that it may be carried away quickly; and at the same time the atmosphere should be maintained in a moist and growing state. After blooming, water should be withheld to a great extent, but on no account must the plant be so dried as to cause it to suffer from drought, for if this occurs much mischief is done, causing it to shrivel, from which state it is frequently very difficult to get it to start into fresh growth in the following spring. During the winter, the atmosphere must be maintained in a dry state, and the temperature should not be allowed to fall below 55° or 60°. The soil should consist of good peat fibre and some sphagnum moss, adding some nodules of charcoal, but very little soil is necessary, and this should be made firm and sound. A small white scale is very apt to infest this plant, and if not cleaned away in time, it works sad mischief; so look the plant or plants over carefully and frequently, wiping away this or any other insect which may be upon them. *Orchid Album*, vol. x., part 109.

ODONTOGLOSSUM ROSSII ALBENS.

This is a small-growing evergreen plant, the flowers being wholly white, save some transverse markings of soft green. Its blooming season is in the late winter and early spring months, continuing some six weeks in full beauty; the flowers last also a considerable time when cut for personal adornment. This variety, like many of the small-growing species, thrives best when grown in a shallow pan or small basket, which should be suspended near the roof-glass, so that it may get the benefit of all the light possible, but we prefer the shallow earthenware pan before anything for these plants. The drainage should be effectual, and the best soil for the plant, or plants, is a mixture of fibrous peat, having all the finer particles shaken out, with some chopped sphagnum moss added; the whole should be well mixed, and in potting, this must be pressed down firmly. During the summer, which is their growing season, an abundant supply of water is necessary, but during the winter they may be kept comparatively dry. *Orchid Album*, vol. x., part 109.

OUTDOOR PEACHES AND NECTARINES IN SUBURBAN GARDENS.

The culture of Peaches and Nectarines in suburban gardens does not, on the whole, receive that attention which their good qualities deserve. It is very rarely we have to record a failure—in fact, I remember but one total failure since 1870, when I first came within the radius of fog and smoke. Partial crops have occurred, but these even have been few and far between. For several seasons now we have annually taken heavy crops from the trees here (Gunnorsbury), and I see no reason why, with ordinary care and attention, this should not continue to be the case during the average of our seasons. The aspect on which the trees are planted is not of the best, our wall which is devoted to these fruits facing nearly west, consequently we lose the benefit of the sunshine for the earlier part of the day. I calculate that this will make us about one week later than a south wall in ripening. This year we gathered Alexander Peach the first week in August, which was later than usual. This variety was soon followed by Hale's Early, which invariably bears well. As this kind ran out, then Rivers' Early York came into use, one large tree of which was planted in 1874, bearing this season over twenty dozen fruits of good size and colour. I find this Peach requires gathering and using before it is fully ripe, and when thus taken, the flavour is much better. It is a Peach deserving of more notice than it receives; but it is, as in the case of the ordinary Early York, not quite proof against mildew attacks. By the time this variety is over, we have Alexander Noblesse, which possesses the same good qualities as Rivers' Early York in freedom from mildew attacks. This is a handsome Peach, and an improvement upon the old Noblesse which mildews badly here; it succeeds the best in a drier season. I found this year as it ripened that it became susceptible to injury from heavy rains. Following this variety are the two fine maincrop sorts, Dymond and Grosse Mignonne; the first-named is one of the best of all with us for cropping qualities good colour, and fine flavour. Later sorts consist of Sea Eagle and Late Admirable; the first-named invariably carries heavy crops, which usually last to the middle of October in good condition. This year they will probably be later, to all appearance. Our season for Peaches is thus extended to about ten weeks, all the trees being on the west wall. Had I another lot, if but a few trees, upon a south wall, it would not be any difficulty to make it three months from start to finish. This, however, is impossible, under existing circumstances.

With Nectarines the season in our case is not so long; but, nevertheless, the results are very good. Lord Napier is the first to ripen, as a matter of course. I find this kind to do remarkably well. This year heavy crops have been taken from the trees, the fruits of good size, and well-coloured, having finished better this season than usual, which

is rather singular, considering the lack of warm weather. Elruge forms a good succession to the foregoing; this variety is closely followed by Humboldt, which is a splendid all-round Nectarine; it is a heavy cropper, the fruits being also of good size and high-coloured, whilst the flavour is excellent. This variety remains in good condition for a longer time than many kinds, which is of no small importance in prolonging the season; it this year lasted to the end of the first week in October. I have not yet tried Galopin, but I hope to do so, and thus lengthen out the season. When Mr. Rivers puts his new Seedling into commerce, then the time of gathering from outdoor trees will be lengthened out further still, this variety being considerably earlier than Lord Napier.

When the main part of our trees was first planted, I found them to grow rather too strongly, but by lifting them once, this evil was remedied. In doing this I trenched deeply, and brought up to the surface some excellent yellowish loam, which was free to a great extent of manures. The trees have done well in this, but little manure having been added since that time, and this chiefly for other crops taken from the border; the trees, in spite of heavy cropping, are still as vigorous as one could desire. In order to keep down overstrong growth, as well as to afford a little additional protection to the fruit whilst still quite young, I do not practice disbudding as early as some growers do; I find this to answer the purpose intended. Even when disbudding is performed, it is done gradually, and never to such an extent as to encourage gross growth in the remaining shoots. I find another most important point is gained by not disbudding early—it is thus of far greater immunity from attacks of aphid; this I have repeatedly noticed during several years. When a few shoots are attacked, they are removed, simply because we can afford to do without them; if, however, the trees had been thinned down so that the shoots could not be spared, then a more tedious process would have to be resorted to for its destruction. We commence to syringe the trees as early as it is in anywise safe to do so; this is done continuously every afternoon up to the time of the earliest Peaches showing colour, save when the weather is showery, and on Sundays. I consider this frequent syringing to be far better than having to resort to the use of insecticides of any kind, particularly in the earlier stages; that it is beneficial to the trees likewise, goes without saying.

When an extra heavy crop is being borne by any one tree, occasional applications of an artificial manure are given, a stimulant of quick action being decidedly preferred. The border being almost level, the rainfall penetrates to the roots instead of running off to other parts; it very rarely happens, therefore, that additional waterings have to be given, except in the driest of seasons. In a few days' time, all the trees from which the fruits have been gathered will be gone over, and the least promising wood thinned out, whilst there is yet time for that which remains to become more perfectly ripened. As soon as the leaves have nearly all fallen, the ties which hold the trees to the wires are all cut, and the shoots then bunched up together, after which the stems of the trees are slightly pressed away from the wall. This is done to obtain an opposing force when the bunched-up shoots are lightly supported by ties to the wires without touching them. The object in tying the branches is to keep the current season's wood away from the wires, for whenever it touches them the shoot is invariably killed by the contact when sharp frosts ensue. The support given is sufficient to prevent injury during heavy falls of snow. The trees are fastened to the wire just before the first flowers expand, but whilst still, in most instances, showing colour. This retards the bloom somewhat, and the prospects of loss from spring frosts is much lessened. When the tying is completed, or as soon as the first flowers begin to open, the wall is covered with three thicknesses of 1-inch meshed fish netting, which is fixed to the top of the wall, and kept away from the trees in a slanting direction by means of Bamboo stakes about 11 feet

in length. These nets afford ample protection against frosts and snow, and we do not remove them before the trees become quite green with the young shoots. After this, in ten days or a fortnight, the disbudding follows. The foliage of the trees being somewhat dense occasions a little more labour in exposing the fruit; this would not, however, be so necessary were it not that the trees, by reason of the wires not being quite close to the wall, as they should be, stand away from it, hence the fruits are not thrust forward as in the case of trees which are nailed to a wall. Our trees are rarely ever affected with canker. I think this is partly to be accounted for by not having used any excess of animal manures to produce luxuriant growth, but we depend rather on good soil as the mainstay of the trees. Other varieties than those named above would doubtless succeed, but I say, by all means, avoid those which are susceptible to mildew, when others equally good can be grown to give satisfaction. The season of out-door Peaches and Nectarines has, thanks chiefly to the many fine seedlings sent out from the Sawbridgeworth nurseries, been greatly lengthened by early and late kinds; it will pay, therefore, to give out-door Peach culture every attention. *Jas. Hudson.*

INGESTRE GARDENS,
STAFFORD.

It is always a great pleasure to me to inspect any well-kept garden, and the more so when the features of good keeping and beauty are above those of the average English garden, as at Ingestre. About the time of my visit, last August, rain had fallen in torrents for several days, and to see everything in good condition was a great treat to me. I may here remark that the indoor and outdoor departments receive equal attention. The walks were scrupulously clean, the turf like velvet, and the pleasure-grounds and kitchen garden in a state of high cultivation.

The flower garden is not large, and small shrubs are largely used in it, as edgings to beds. These shrubs are cut into suitable shapes. There are shapely Junipers, and variegated *Acer negundo*, in fine specimens, in the flower parterre and other parts of the gardens. Some of the finest Irish Yews in this country stand on an elevated spot; they are nearly 40 feet high, and as much round them. Beech, Limes, and Oaks grow to a fine size at Ingestre; and Conifers are represented by fine specimens of *Sequoia gigantea*, Canadian Spruce, Cedars, Yews, and *Retinosporas*.

Some grand young trees of species of *Pyrus* are also in the grounds, *P. sorbus* and *P. floribunda* being very fine.

The entrance from the houses to the flower garden and kitchen garden is by way of a terrace 400 yards long, on which are borders on each side of the path planted with the choicer herbaceous perennial plants, Irish Yew and creeping plants forming an arch over the path. The effect is very good when viewed from either end.

The end of this walk terminates in a conservatory 100 feet long, which was artistically arranged with fine Palms, *Dracenas*, and others having handsome foliage. In front of this conservatory is a well-kept Rose garden, where the Rose bushes were in splendid condition, Mr. Gilman being a believer in putting plenty of manure to his plants. The long range of fruit houses is close to this part of the garden, and consist of vineries and Peach-houses; the trees in the latter being excellent examples of good culture, very clean, and the wood not too abundant or crowded. The varieties of Peaches grown in the earliest division were Hale's Early, *Violette Hâtive*, and Lord Napier Nectarine, which does grandly. In the next house, in order of ripening, were Barrington, Royal George Peaches, and *Violette Hâtive* Nectarine; and the late house contained some very fine plants of Pine-apple Nectarine, Victoria, and other late varieties of the Peach. There are four vineries. In the early vinery the fruit was cleared off; but the Muscat-house and the late vineries con-

tained good bunches of Black Alicante, Alnwick Seedling, and Lady Downe's. White Tokay and Trebbiano are grown in the second vinery; and these, Madresfield, and Gros Colmar, complete the list of the varieties grown. Figs are well grown, and the trees are in splendid condition. White Marseilles and Brown Turkey are the kinds grown. Pine-apples are grown in small numbers, but Melons largely, and the Melon-houses are very light and well-ventilated structures. Mr. Gilman grows a fine green-fleshed variety, named *Ingestre Hybrid*, and the Countess, with some few others. Cucumbers and Tomatos are grown in large quantity in the same kind of house as the Melons. About 1000 Strawberry plants are forced yearly. Sir Harry and Keen's Seedling are the varieties grown, the former being much liked.

The plant houses contain fine decorative subjects, plants for house decoration being much required. Ferns are largely cultivated, as are Winter Carnations. A house full of very clean Crotons of a useful size and fine colour, and Gardenias, was observed. Palms and flowering plants of the stove were observed in several houses in robust health.

Orchids do not occupy much space at Logestre, but mention should be made of a house full of *Calanthe* and *Dendrobium*, the first-named having very strong growths, and promising well for late autumn bloom; the *Dendrobes* are also grown for decorative purposes, and stood, like the *Calanthes*, in 48-pots.

Begonias and *Bouvardias* have houses to themselves, and are well grown. A large number of *Mimulus* in pots was noticed; it is a very pretty and useful plant in the early autumn. A quantity of *Begonia nitida* and *B. manicata* are grown; and about 1000 *Chrysanthemum* plants are cultivated for the same purpose, and are excellent specimens. Fruit trees in the kitchen garden bore good crops. G. W. S.

FRUIT AT HUTTON HALL.

Those who have seen many of the principal fruit shows, especially those held at the leading places in the north of the kingdom, including Scotland, are, no doubt, well acquainted with the excellence of the fruit that for many years past has been forthcoming from this celebrated garden, and with the high position Mr. McIndoe usually attains to in the competitions. At the recent Caledonian Society's Show, he again secured first honours in the leading class of twelve dishes, for which, in addition to the handsome prize offered by the Society, he was awarded the 10-guinea Cup given by the Turner Memorial Trustees for the best collection of fruit shown in the exhibition.

A sight of the vineries at Hutton Hall a short time after the Edinburgh Exhibition gave ample evidence that they still contained quantities of splendid Grapes, both in regard to the size of their bunches and berries, as well as their general finish. In one of the large houses, which contained a number of varieties, Mrs. Pince was exceptionally fine, the bunches large, full, even in berry, and excellently coloured. Of Lady Downe's, there were large numbers of perfect examples, full-sized, and larger in the berries than this excellent winter Grape often gets. Alnwick Seedling was also in superb condition, and faultless in finish, with larger bunches than usual, and with no defective setting. Gros Guillaume (*Barbarossa*) was represented by beautiful bunches, highly coloured. Trebbiano was also noticeable. In this house there is a new Grape that promises to be a desirable one. It is a cross between Duke of Buccleuch and Gros Guillaume, and perfectly black in colour. The bunches are large, long, and moderately heavy at the shoulder; it is good in flavour, and large in berry.

In another large house, where, as in that already described, there are various sorts grown—Madresfield Court, Gros Colmar, and Black Alicante were exceptionally fine, as likewise were Duke of Buccleuch and Golden Champion. As seen here, the latter is a grand-looking Grape.

In the principal Peach-house, amongst several fine trees, there is an example of Goshawk that fills a space 40 feet by 17; the crop this year numbered 450. Golden Eagle, another Peach that is not met with everywhere, is a favourite here.

In this bleak district little can be done on open walls with the best kinds of Pears and Plums. To meet this difficulty, a selection of the best sorts is grown under glass, with highly satisfactory results both in the size and quality of the fruit, as well as in appearance.

In one of the houses there were two plants of *Lapageria*, one white, the other red-flowered, which were carrying the heaviest crop of flowers for the space which they occupied that I recollect to have seen. The red one fills a space of 12 feet by 9, and had 580 fully-expanded flowers. The white one is smaller, covering 10 feet by 9; it had 400 perfect flowers. Both the plants are fine forms of this beautiful climber. T. B.

J. H. KRELAGE.

We take the opportunity afforded us by the publication of the illustration of the new race of Darwin Tulips, to offer a portrait of one of the foremost horticulturists in Holland, or indeed of any country—of one, moreover, whose disinterested services and

MR. J. H. KRELAGE.

kindness can always be counted on. For our own part, we are glad of the opportunity of expressing our gratitude for the valuable information we have so often received in response to our inquiries.

Jacob Heinrich Krelage was born in November, 1824, at Haarlem. He was the only son of E. H. Krelage, a native of Osnabruck, Hanover, who founded the business at Haarlem in 1811—at first on a very modest scale, but soon extended his operations also to Frankfort, of which city, by marriage with Miss Fresenius, he became a free citizen, and in consequence entitled to carry on business independently of the fairs. In 1830, an eulogistic account of Mr. Krelage's nursery was given in London's *Gardeners' Magazine*, showing the extent to which even then the business was carried. Year after year further extensions were made, and in 1841 J. H. Krelage undertook the management of the Frankfort branch. In 1850 the son entered into partnership with his father, the firm being styled, as it still is, E. H. Krelage & Son. In 1855, the original founder died, leaving the subject of our sketch at the head of the establishment. The subsequent record of the firm is one long succession of extensions, royal visits, and records of successes obtained at various exhibitions in Holland and elsewhere. In 1856 the Frankfort business was given up.

The last among the more notable introductions of the firm are the Darwin Tulips, to which allusion is

made elsewhere. These originated in the collection of M. Lenglard, of Lille, which was purchased by Mr. Krelage. Mr. Krelage's knowledge of the history of bulbous plants is naturally most extensive and varied, and not only is he in personal possession of horticultural lore and experience beyond what is accorded to most people, but his library is the envy of collectors, and the delight of bibliographers.

ROSERY.

LIFTING HYBRID PERPETUAL ROSES.

A FEW practical hints to any who think of growing a few plants in pots of this section of Roses, during the next summer, may not be out of place. There could not possibly be any better time than the present for this operation. For not only are the plants quite ripe enough for lifting, but they invariably do much better when got into their pots as soon as possible after becoming a little more than two-thirds ripe or matured. By lifting them early, and giving them quite cool treatment, until early in the following spring, the plants will be getting steadily settled in the new soil, and will grow on and make fine healthy wood during next summer. When Roses are potted-up early, they commence to make new roots at once; this is not so much the case if left until December or January before being transferred to fresh soil.

Use a good and rich loamy compost, well-drained pots, and above all, do not try to hurry the plants into growth during the coming spring and summer. It is not necessary to have turf, or even turfy loam; almost any good fresh soil will grow Roses well, particularly if it is a little porous, and assisted with thoroughly decayed manure of any kind. Turf and turfy loam are excellent things, but very few are so fortunate as to have plenty of them to use for potting purposes; and, as I said previously, it is not absolutely necessary to have them to grow Roses well.

Plunge the pots in some ashes or Cocoa-nut fibre refuse, keeping the severe frost only from the wood, and prevent the wood or roots becoming dry enough to cause shrivelling. Prune back rather hard early in February, and allow the plants to come on as they like in a temperature of 50° to 55°, rising to 65° with the sun upon a bright day. Frequent syringings with clear soft water, of the same temperature as the house, or a few degrees higher, will help them very much. Do not feed with liquid manure during their first season, as the plants ought to be able to find quite enough nourishment from the fresh soil. After the roots have filled their pots, and the plants are in full growth the second time, is when a few manure waterings will be beneficial.

Hybrid Perpetual Roses lifted at once will make grand stuff for forcing in the winter and early spring of 1893; but it is not good policy to attempt forcing this section until the plants are thoroughly established in their pots; nor should they be forced so severely as those of the Tea-scented and Noisette classes.

A dozen of the very best hybrid perpetuals for this purpose are:—General Jacqueminot, Fisher Holmes, La France, Baroness Rothschild, Mrs. John Laing, Gloire de Margottin, Eclair, Mlle. Gabrielle Luizet, Louis Doré, Prince Camille de Rohan, Beauty of Waltham, and Augustine Guinoisseau, the new "white La France." Viscountess Folkestone, Lady Mary Fitzwilliam, and Grace Darling are three hybrid Tea-scented kinds that do excellently when treated similar to the hybrid perpetuals. A. P.

NOTICES OF BOOKS.

COURS D'ANGLAIS. Par Alfred Legrand. (Paris: Mesnit-Dramard et Cie., 3, Quai Voltaire.)

THIS is the text-book for the pupils of the National School of Horticulture at Versailles who desire to learn English. It contains a succinct account of

English grammar, a list of irregular verbs, colloquial phrases, and idiomatic expressions; details concerning money, weights, and measures; sketches of the history and literature of Great Britain; models of commercial correspondence, &c. The plan of the book is decidedly better than the realisation. To teach pronunciation by books, or any process short of practice and careful imitation of the best speakers, is obviously impossible. As a proof, take what the author says about the pronunciation of the letters *th*, which form such a stumbling-block for most Frenchmen.

"There are two modes," says the author, "of pronouncing the letters *th*, the one soft, the other hard. To pronounce the letters *th*, the tongue is protruded between and pressed up against the upper teeth, so as to utter the sound of *z* for the soft *th*, and that of *s* for the hard *th*." [Thus, in the word *that*, the *th* is to be sounded soft like *z*, and in the word *thin* the *th* is to be pronounced hard, as if written *sin*]. Then follows an example: I thought (*dur*), the path (*dur*) was smooth (*dour*), but found that (*dour*) there were both (*dur*) thorns (*dur*) and thistles (*dur*) there (*dour*)." In endeavouring to follow the author's directions as to hard and soft sounds in the foregoing passage, we arrive at something like the following:—"I sought se pas was smooz, but found zat zere were bos sorns and sisles zere." We concur in that opinion in this case!

The very first among the "phrases usuelles" is happily one not often heard by English ears. "Down with the spy!" In its French form, *à bas l'espion*, we may hope shortly to find it as little in use as it is here. The epitome of English literature, though, of course, greatly condensed, appears to us to be better carried out than the other portions of the work. There are, however, many names included, of which the average Englishman knows nothing, such as Bernard de Mandeville Marmion, the author of a play called "The Antiquary!" It seems strange, also, considering he was not born when the great Queen died, to class Milton with the Elizabethan poets, from whom he differs so materially. On the whole, we rather think the English student will get more information from this book, as he certainly will derive more amusement, than his French colleague will do.

PIESSE'S ART OF PERFUMERY. (Piesse & Lubin, New Bond Street, London.)

We have to chronicle the appearance of a fifth edition of a book which is a veritable encyclopædia of the subjects on which it treats. Of a fifth edition we need not say much, but we cite one passage from the preface for the benefit of our readers:—"Horticulturists being generally unacquainted with the methods of economising the scents from the flowers they cultivate, entirely lose what would otherwise be a profitable source of income!" For many ages the Cornish miners, while working the tin streams, threw the copper ore over the cliffs into the sea. How much wealth was thus cast away by ignorance we know not; but there is a perfect parallel between the old miners and the modern gardeners. Our gardeners, however, are not quite so behind-hand as this passage would lead the reader to infer. At p. 180 of the same volume, we are told that the finest Peppermint is that cultivated at Mitcham. Lavender and Rosemary are also grown in the same neighbourhood, and at Hitchin. "The essential oil there produced is," says Mr. Piesse, "very far superior to that produced on the continent." At p. 144, Mr. Piesse gives an account of the method of cultivation, but says nothing about the mysterious fungoid disease that has occasioned so much loss. No doubt our colonial friends might do much more than we do, and Mr. Piesse's book contains details as to the statistics and working of flower farms which will be of great service to them. It will also show that certain perfumes are not what their names imply. *Rondeletia* of the perfumers, it appears, is a mixture of otto of lavender and oil of cloves, with musk, vanilla, and ambergris thrown in. "Wood Violet," however, which we had thought to have nothing to do with Violets of any kind, except the name, is

really a compound into which Violets enter. By "Syringa," Mr. Piesse means Philadelphus, or Mock Orange, the flowers of which are used in France to confer scent on pomatum, and which the author tells us could be made in our colonies [and perhaps here] at a quarter the cost paid for the so-called Orange pomatum. The Lilac, or true Syriaga, also, might surely be utilised here. "Jonquil" is made up of jasmine, tuberose, orange-flower, and vanilla. Would it not be cheaper and better to procure it from headquarters by means of *enfeurage*? "Cedar" perfume is made from the so-called Red Cedar (*Juniperus virginiana*), and not from any true Cedar. Otto of Almonds is made artificially from benzol.

The days of polypharmacy are over, medical prescriptions are simplicity itself in comparison with what they once were; but in perfumery, according to the book before us, mixtures of the most complicated character still occur, and we doubt not that Mr. Piesse can give good chemical reasons for the combinations. Kew Garden Nosegay, we may add, is composed of an admixture of neroli, cassie (*Acacia Farnesiana*), tuberose, jasmine, geranium, musk, and ambergris. Elsewhere we are told that the "geranium" is really *Pelargonium capitatum*. Certain it is that in these days of germicide-vapours more attention will be given to these perfumes than before, and the importance of certain odorous substances, like camphor for instance, once thought to be over-estimated, will once more be brought into prominence.

MUSHROOMS, AND THEIR CULTURE.

By C. Brooks.

We do not remember to have met with a little treatise (treatment it is called) which is so full of mis-statements, erroneous ideas, and bad English, as this one on Mushroom culture. Moreover, there exists no need for a manual on the subject, considering how well it has been handled by Mr. J. Wright, of the *Journal of Horticulture*, who has said all that would be found of any service by the greatest novice in the art of growing Mushrooms.

THE WEEK'S WORK.

THE FLOWER GARDEN.

IN continuation of my remarks in the previous week on the planting of Roses at this season, I now give a select list of varieties in various classes of Roses. They are what is understood as garden varieties, in contradistinction to those which are essentially show Roses, being of good habit, strong constitution, and profuse bloomers, and handsome withal.

BOURBON ROSES.—*Acidalie*, white, tinted rose, very beautiful; *Armosa*, clear, bright pink, an old but excellent Rose, of China-like habit—a constant-blooming variety; *Catherine Guillot*, very bright carmine-rose, free bloomer, and good habit; *Queen of Bedders*, deep crimson, and very free-flowering; *Rev. H. H. D'Ombraïn*, bright carmine, large, and of good form; *Souvenir de la Malmaison*, pale blush, very large, a fine free-blooming autumn Rose—a time of year when the Bourbon Roses produce their finest blooms.

CHINA ROSES.—*American Banner*, flowers semi-double, yellowish-white, with broad, rose-magenta stripes, very free-flowering; *Archduke Charles*, rose, changing to deep crimson; *Clara Sylvain*, pure white, large; *Cramoisi Supérieur*, brilliant crimson, fine for beds; *Ducher*, pure white, medium size, full and well formed, growth vigorous, fine for massing; *James Sprunt*, deep crimson, pretty shape, of moderate size, a distinct, climbing-habited sport from *Cramoisi Supérieur*.

HYBRID CHINA ROSES.—*Blairii* No. 2, pale blush, very large and double; *Coupe d'Hébé*, waxy pink, beautiful; *Fulgens*, bright crimson-scarlet, superb; *Juno*, pale rose, very large; *Madame Plantier*, pure white, in large clusters; *Paul Verdier*, very bright rose, large, full, and fine shape, and very vigorous.

HYBRID PERPETUALS.—*A. K. Williams*, bright carmine red, large, round, imbricated flower; *Alfred Colomb*, bright red, full, and very showy; *Auguste Rigotard*, bright crimson, large, and good; *Bessie Johnson*, blush white, large, very sweet, and good habit; *Captain Christy*, delicate flesh colour, deeper in the centre, very effective; *Charles Lefebvre*, fine, bright, dazzling crimson-scarlet, shape, colour, and form very good; *Comtesse d'Oxford*, brilliant carmine, very large and full, of fine form and vigorous growth; *Dr. Sewell*, brilliant crimson-scarlet, shaded with purple, large, full, and finely-cupped form; *Duchess of Edinburgh*, a fine, light-coloured Rose, large, full, and well-formed; *Duke of Connaught*, rich, bright, velvety crimson, with an intense fiery blush, free and good; *Fisher Holmes*, bright scarlet, imbricated; *François Michelon*, deep rose, reverse of petals silvery, large, full, and globular form; *Helen Paul*, white, sometimes shaded with pink, large, full, and globular; *Illypote Jamain*, fine, bright rose, shaded with carmine, very large and full; *John Hopper*, fine rosy-crimson, back of petals fine lilac-tint, large and full; *Jules Finger*, white, centre shaded with pink, growth very vigorous, flowers large and full, and perfect in form; *La France*, beautiful rosy-lilac, very distinct, large and full, free blooming; *Madame Eugène Verdier*, bright rose, suffused with white, large and showy; *Magna Charta*, bright pink, suffused with carmine, very large, full, and of good form; *Marguerite de St. Amand*, bright pink, large, full, and imbricated; *Marie Baumann*, light crimson-red, very large and full; *Mdlle. Marie Rady*, fine brilliant red, good form, and very fine; *Miss Hassard*, delicate pinkish-flesh, large, full, fine shape, and very sweet; *Ulrich Brunner*, bright cerise red, large, and full.

MOSS ROSES: SUMMER VARIETIES.—*Alice Leroy*, blush, shaded with rose—large and double; *Baronne de Wassenaer*, deep rose—very large and double; *Captain Ingram*, dark velvety-purple—fine; *Marie de Blois*, bright rose—large, full, well mossed, handsome buds; *Nuit d'Yong*, velvety-purple; *White Bath*, paper-white, beautiful, large and full.

PERPETUAL MOSS ROSES.—*Blauche Moreau*, pure white—of perfect form, well mossed, the sepals passing beyond the bud nearly an inch; *James Veitch*, deep violet, shaded crimson, large and double; *Madame Moreau*, fine vermilion-red, veined with white—very large; *Madame Edouard Osy*, reddish-crimson; *Perpetual White Moss*, white—very pretty in the bud; *Souperet* of *Notting*, fine bright rose—perfect form, very large and full.

Brief lists of *Noisette*, *Tea*, and other sections of the *Rose* not included in the above, will be given in our next paper. *H. W. Ward, Longford Castle, Salisbury.*

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—The earliest trees having shed their leaves, which, owing to want of sun, have held on longer than usual, unfasten the branches from the trellis or wall, and perform what little pruning may be necessary, which will not be much if previous directions have been attended to. Some shoots may require to be shortened to the desired length, and to a woody bud, but very well-ripened shoots may remain uncut if the tree is a well-furnished one. Some gardeners have great objection to the use of the knife at the time the fruit is gathered, but I think it has an advantage over the severe pruning of the trees when they are at rest; as when the shoots are thinned at the earlier period, it gives those which are left a better chance to ripen—one of the chief points in Peach culture. Another objection is that this early pruning causes much root activity; and it may do this in the case of young trees, but such should be lifted as a preventative of too much root action. The dropping of the largest buds is often a cause of anxiety to the cultivator, and, though I do not say it can always be prevented, it may be checked by keeping the soil moist at the resting or ripening period, and by freely exposing the trees, so as to get all the current season's shoots properly matured; and by evenly balancing the shoots by pruning and disbudding, as it is usually the case that large unripened shoots drop their buds the worst.

The houses should be cleaned by washing the woodwork and glass, and repairs done before the trees are secured to the trellises. The trees may be washed with an insecticide, and the older parts dressed with a mixture of tobacco-water, flowers-of-sulphur, soft soap, clay, and quick-lime, previously syringing the trees with petroleum at the strength

of half-pint to one gallon of water. The surface soil of the borders should be removed, and a fresh coat consisting of loam, mortar rubble, wood ashes, and bone-meal put on. Ventilation should be freely afforded, and the trees remained unfastened for some time yet. When the shoots are at length tied in, leave ample space for training in next season's shoots, remembering that crowded trees are difficult to keep clean. Freely expose the trees in late houses, and clear off decaying foliage as soon as it drops of its own accord. Those who have trees on walls to fill vacancies with should not wait for the foliage to have fallen entirely, but plant at once. *G. Wythes, Syon House, Brentford.*

PLANTS UNDER GLASS.

THE FORCING PITS.—Roman Hyacinths, some of the earliest at least, will be coming into bloom, therefore more of them should be put into gentle warmth to form a succession; also place in the forcing-pit a few plants of the Indian Azalea, choosing those which were forced early last season, or, failing these, some with prominent flower buds, and especially *Deutsche Perle* and *Fielder's White*. *Azalea indica* has set its buds more freely than usual, and the shoots are thoroughly ripened, two things which make them in the best possible condition for early forcing work. Syringe the plants in the forcing-pit in the afternoons, using warm water for the purpose, and continue the practice until the blooms begin to open, when it must be discontinued. Bring into this pit a few plants of *Calla*, which have been grown in pots during the summer, keeping them well up to the glass, and assisting them with frequent doses of clear manure water. A few plants of *Cactus* or *Epiphyllum truncatum* should also be brought in, if the growth is thoroughly matured.

THE STOVE.—Old plants of *Crotons* which may have got thin and straggling should be cut hard in, when they will break back, and still make useful plants. Keep them rather dry at the roots till fresh shoots push, and if they are infested with mealy-bug, scale, &c., have them cleaned, this operation being much more effectually done than when the plants are furnished with full foliage. Young *Croton* plants are sometimes much in request for decorative purposes in the dwelling and conservatory, and when well grown, there are few species handsomer, and the gardener should propagate a good many annually, and then by growing them on in good heat, and keeping them always in a clean state, he will generally be in possession of serviceable stock. Frequently sponge the leaves of *Dracænas*, especially the under-sides of these, as it is generally there that thrip are first to be found. *Dracænas* which have got leggy through age, should be cut down, the tops denuded of a few of their lower leaves, and put into small pots, filled with a sandy compost, fastening the leaves lightly to a stick, and placed in a brisk bottom-heat, covering them with a large bell-glass or handlight, when they will quickly strike root. Be careful to wipe out the glasses daily, leaving them off for thirty minutes. Young plants of *Ixoras* should now be growing freely, and if any of the shoots are taking an undue lead, pinch out the points, which will cause the shoots to break back, and throw strength into weaker shoots. Keep the plants free from mealy-bug. Old *Ixoras* going out of bloom should be kept rather drier at the roots, and in a rather lower temperature than that in which they were grown.

CHRYSANTHEMUMS.—The plants forming the chief portions of the stock will be at their best, and care must be taken in keeping the house free from damp, or the flowers will soon suffer. To keep presentable plants as long as possible, pick off all decayed leaves and flowers, and admit sufficient air on favourable occasions to dry up damp, at the same time keeping the hotwater-pipes sufficiently warm to assist the ventilation. Finish off the watering in the morning, and do not spill water about the floors, &c. *R. Milner, Peirce Castle, Swansea.*

THE ORCHID HOUSES.

THE EAST-INDIA HOUSE.—The month of November always finds this house ill supplied with flower, unless *Calanthes* are grown in quantity, which make a display till other Orchids commence to flower. The two best varieties for winter flowering are *C. Veitchii* and *C. vestita rubra*, both of which are easy to grow; but strong heat is needed to bring them to perfection. Although the weather may

remain cloudy, the plants must be carefully watched, and no strong sunlight allowed to shine on them, or the points of the leaves will decay, and once this commences, nothing will stop its progress. Watering must be very carefully done, and the plants not allowed to get dry at the root. In the present dull state of the weather, *Phalaenopsis* will not require shade unless the sun should shine very strongly, when a little shade must be afforded. A certain amount of sunshine is needed to perfect the new growth, which should be hard, thick, and leathery.

CYPRIPEDIUMS, as they go out of flower, should be repotted if this be necessary. A great number of the *Cyripediums* require a compost of peat and sphagnum moss, whilst some others grow better when a certain amount of fibrous turf is added to the compost, but I always pull the lumps to pieces and sift the greater part of the fine loam out of it. If a few 1-inch bones are placed over the drainage materials it will assist the plants considerably, and those who have not yet tried bones should do so, and watch results. One of the finest things for drainage are the clinkers from the stovehole, the only objection to them is their weight; for *Cattleyas*, I believe them to be far before the potsherds commonly used.

THE INTERMEDIATE HOUSE.—The *Barkerias* and the *Pleiones* are now in flower, and these should be found in every amateur's collection. The *Pleiones* are of the easiest culture, also very cheap, and requiring but little heat. They are nice button-hole flowers, and the best perhaps for this purpose is *P. maculata*; but all are pretty, and when treated alike they come on in a succession of flowers that lasts about two months.

VANDA AMESIANA withstands the effects of fog; it did so here when *Phalaenopsis* buds and flowers were lost last year. The varieties of this plant are endless, and some prefer the dark ones, while others have a great preference for the white varieties. I would recommend all buyers to see the flowers first, as it is then more satisfactory to purchaser and seller alike. The temperatures for the different divisions may run for the East-India house about 65° at night, *Cattleya*-house 62°, intermediate-house 60°, cool-house 50°. *A. G. Catt, Parkfield, Hallow, Worcester.*

THE KITCHEN GARDEN.

SEAKALE.—If this vegetable is wanted very early, care should be taken to lift only the ripe crowns, if all of them are not fit for being forced at this season. The roots may be partially lifted by having a fork thrust under them, and gently raising them, and this should be so carried out as not to cause much flaggling of the leaves. When finally dug up, place them in regular rows in a dark Mushroom-house, or any other suitable place. A mild hotbed, composed of leaves, may be made use of to stimulate growth, and light soil or leaf-mould packed about them, a light watering with tepid water being afforded to settle the soil, and clean the crowns of soil. The maximum temperature should be 60°, small wiry heads resulting from a temperature that is higher than that. About 100 crowns to start with, and about sixty to put in to force once a week afterwards, will be found sufficient for a fairly large establishment. *Seakale* may be equally well grown in large pots, with a rather smaller pot inverted over each, and covered with litter, standing them in a dark warm place.

CABBAGES.—Where Cabbages in sufficient numbers have not been planted, another plantation should be made as soon as possible. Put out the plants in rows, from 1½ to 2 feet apart, according to the variety, or plant 1 to 1½ foot apart, the plants to be thinned out in April, and later. Where Cabbage plants still remain in the seed beds, have them planted in beds in a warm situation, as a reserve.

WINTER SPINACH.—The beds of this vegetable should be kept free from weeds and fallen leaves, as if these are allowed to grow at this time of the year, they would, in mild weather, soon overrun the land, and injure the crop. Handweeding is to be preferred if Chickweed and the like are plentiful. If the *Spinach* plants have not been finally thinned, this should now be done, and in doing so, always taking the weakest plants. *Spinach* of the August sowing will be fit for gathering, and any necessary thinning should now be done, leaving the plants 6 inches apart

if of the ordinary varieties, and more for *Monstrens de Gondray* and *Viroflay*. In gathering *Spinach*, take the largest leaves, never the heart leaves.

ENDIVE.—Once a week, on a dry day, tie up to blanch the full-grown plants, gathering up all the leaves close, and tying the plant with a piece of strong matting, not too tightly, but leaving room for the heart leaves to grow, and closing the leaves over the top. Some kind of protection against frost should be got in readiness, as in a wet state the younger leaves of *Endive* suffer from even a degree or two of frost. In the absence of frames and lights, it is a good plan to lift the best plants, and plant them on a sloping south border, and allow each plant just space to stand clear of its neighbour, and protect with mats or broken Fern when frost threatens. *Endive* and *Lettuces* in frames should be ventilated during mild weather, and have all dead leaves cleared away.

CHERVIL.—This herb is often required by cooks, although it is almost a hardy plant, it will be prudent to place some kind of covering over it, so as to be able to have a supply of fresh leaves in hard weather.

TARRAGON AND SPEARMINT roots should be lifted and planted in boxes, and placed in an intermediate temperature; and roots of *Sorrel* also may be lifted, and the mass of roots being large, it is best to put them into pots.

MUSTARD AND CRESS may now be raised in warmth in shallow boxes filled with light soil, made moderately firm, the seed being pressed gently into the soil, and the boxes covered with pieces of board or slate until the seed sprouts. *E. J. Waite, Glenhurst, Esher.*

THE HARDY FRUIT GARDEN.

THE PRUNING OF SMALL FRUITS.—The time has now arrived when the pruning and putting into order of most kinds of fruit bushes may be undertaken and pushed forward as fast as possible whilst the weather remains mild, for twice the amount of pruning may be done in mild as in cold weather. *Gooseberry* bushes should be attended to first, although in some gardens owing to the ravages of tom-tits and some other birds, these must be left unpruned until late in the spring; consequently, to a time when work is more generally pressing, and the pruning is apt to get insufficient attention. If the pruning be done at this season, and the tops are well dusted at intervals throughout the winter and spring months with soot and lime, or syringed with petroleum and soap-suds, the loss of buds will to a great extent be avoided. In pruning *Gooseberry* bushes, keep the branches moderately thinned out, so that light may be admitted to the interior, and do not shorten leading shoots if of strength equal to carrying the weight of the fruits without bending to the earth; and some of the lower branches should be cut out, and the heads kept in good form, the laterals being shortened back to a few eyes at the base, and all root-suckers removed with the sucker-iron. Scrape the soil from under the bushes, if the *Gooseberry* sawfly has been troublesome, replacing it with mould from some other part of the garden not likely to contain the larva of the fly. When pruning, make a selection of shoots to serve as cuttings to be heeled in without delay, or made at once into cuttings and put out into beds.

BLACK, RED, AND WHITE CURRANTS.—These may be pruned, the black variety being treated like the *Gooseberry*; but *Red* and *White Currants* should be close spurred, by shortening all the lateral shoots, except those needed for extension, to within two eyes of the base, and the leaders to 4 inches, according to the age and size of the bush, as young plants should be allowed to extend themselves until they have grown into good-sized bushes, which is done by preserving strong outward-inclined shoots, which should be cut back one-half or one-third of their length, and always to a bud pointing outwards. Shoots bare of fruit spurs should be replaced with stout young shoots, which should be slightly cut back. *Gooseberries* and *Currants* may be trained to walls, and if the wall face the north, the fruits will be fit for use long after bush fruits are over. The stems, to the number of four, may be trained upright, or better, obliquely, as then the fruits hang clear of the stems, at 1½ foot apart. The laterals are pruned as in bushes, a short leader being left for extension until the limit of space is reached. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, Nov. 5.—Linnæan Society.

SHOWS.

TUESDAY, Nov. 3. { Wells (two days).
Brighton and Hove (two days).
Brixton, Streatham, and Clapham
(two days).
Watford (two days).
Kent County (two days).
Ipswich, Beddington, Carshalton,
and Wallington, Show and Con-
ference on Fruit and Chrysan-
themums.
WEDNESDAY, Nov. 4. { Ealing, Sittingbourne (two days).
Ascot, Portsmouth (three days).
THURSDAY, Nov. 5. { Chiswick Horticultural Society.
Highgate.
FRIDAY, Nov. 6. { Crystal Palace Chrysanthemum
(two days).

SALES.

MONDAY, Nov. 2. { Dutch Bulbs at Protheroe & Morris'
Rooms.
Dutch Bulbs at Stevens' Rooms.
Dutch Bulbs, at Stevens' Rooms.
Lilium auratum and other Lilies,
and Dutch Bulbs at Protheroe &
Morris' Rooms.
TUESDAY, Nov. 3. { Great Annual Sale of Nursery
Stock, at Hale Farm Nursery,
Tottenham, by Protheroe &
Morris.
WEDNESDAY, Nov. 4. { Dutch Bulbs, at Stevens' Rooms.
Clearance Sale of Nursery Stock at
Mr. Mahood's Nursery, Tangley
Park, Hampton, by Protheroe &
Morris (three days).
Plants and Bulbs, at Protheroe and
Morris' Rooms.
THURSDAY, Nov. 5. { Dutch Bulbs at Stevens' Rooms.
Dutch Bulbs at Protheroe & Morris'
Rooms.
Great Sale of Orchids, at Protheroe
& Morris' Rooms.
FRIDAY, Nov. 6. { Important Sale of Fruit Trees, at
Cliffe, near Rochester, by Pro-
theroe & Morris.
SATURDAY, Nov. 7. { Dutch Bulbs, at Stevens' Rooms.
Dutch Bulbs, at Protheroe &
Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—45°.

Technical
Education.

Now that the subject of horticultural and agricultural education is occupying so much attention, we may profitably cast our eyes upon what our neighbours are doing. For this purpose, we commend to the notice of those concerned, M. DEHÉRAIN'S inaugural address to the French Association for the Advancement of Science at Marseilles. (Greatly to our regret, we cannot print this at length, but the few comments we can now make, will show its purport and its scope. The original may be read in the *Annales Agronomiques* for September 25. The address took the form of a very interesting summary of the relations between physiology, chemistry, and agricultural practice. What is said of agriculture is, of course, with the necessary modification equally applicable to horticulture. Sketching in broad outline the progress that has been made, M. DEHÉRAIN alluded to the researches of DE SAUSSURE on the ashes of plants, showing incidentally one curious illustration of the loss and waste of time entailed by purely empirical methods as compared to those based on exact knowledge and direct experiment. Thus DE SAUSSURE, as long ago as 1804, announced the

presence of phosphate of lime in the ashes of all the plants he had examined, but it was not till twenty years later that the chance application of animal charcoal as a waste product from a sugar refinery to the land, brought to light the fertilising properties of a substance the value of which might at once have been established had practical men turned DE SAUSSURE'S experiments to account. The history of the nitrogen question, as here given, is interesting from the first, but more than ever so now, that the fertility of the soil is proved to depend not only on certain mineral ingredients, but also on germs which act as a ferment, instrumental in the conversion of the insoluble into the soluble nitrates.

Leaving the subject of chemistry, M. DEHÉRAIN pointed out, how, acting on botanical lines by a mere process of selection, the yield of Wheat and of Potatoes may be, and has been, largely increased. Of course, in this matter, gardeners are far in advance of the farmers. Naturally, the Phylloxera occupies a great deal of attention, as also the oidium and the peronospora of the Vine. The salts of copper are shown to be as useful in checking the ravages of the one as sulphur is in controlling the mischief effected by the other. A few years ago, says M. DEHÉRAIN, the scientific men were not listened to. It is very different now, at least in France; and M. DEHÉRAIN attributes the reason of this beneficial change to the general spread of education, the establishment of agricultural schools and experimental stations, and especially to the employment in each Department of a man well qualified to act as the middleman between the men of science in the laboratory and the men of practice in the field. These peripatetic instructors gather the farmers together on Sundays, as the only available day in France, talk with them about their business, instruct, and advise them, so that both parties are benefited, science modifies her absolute or too abstract character, practice on her side widens her narrow limitations, and the result is that sound methods are inculcated and extended. To the oral instruction thus afforded, is added in each Department the means of practical demonstration or of experimental trial by means of local trial-grounds, which may be counted by the dozen in many of the Departments of France. At the same time, elementary schools of horticulture and agriculture throughout the country are training a race of cultivators to be as practical as their fathers, but with more receptive intellectual powers.

As LEONARDO DA VINCI is reported to have said, "Theory is the general—practice the soldiers." Carrying out the simile, we would say that the teachers are as the officers instructing the men how best to carry out the orders of the general. Each is essential, the one to the other, and means must be taken to secure adequate training of all. In this connection, we call special attention to the scheme in another column, formulated by a committee of the Fruit-growers Association.

THE DARWIN TULIPS.—Our Supplementary Illustration shows a field of these brilliant novelties, towering above which is to be seen the portraiture of the proprietor who, in more senses than one, is one of the greatest men in Holland. Darwin Tulips, which were so enthusiastically spoken of by one of our correspondents who saw them in bloom last spring, constitute a new strain of late-flowering self-coloured or "breeder" Tulips, remarkable for the brilliancy of colouring. So brilliant are they, that we might be well content, if they remain as they are,

and do not "break" into the forms beloved of florists. Nevertheless, from a botanical point of view, as well as from the standpoint of the florist, there is great interest in watching the changes that occur, and in endeavouring to arrive at some explanation concerning them. No more remarkable instance of selection, according to Messrs. KNEBELAGE, has been witnessed than this, and, on that account, the new race has been dedicated to CHARLES DARWIN, who made a special study of variation in plants, and as a result, inaugurated a new epoch in scientific knowledge. At the Paris Exhibition these Tulips attracted great attention, not only for their beauty of colour, but for their hardihood and power of enduring both sun and rain. Among them is the "black Tulip," described as "the most absolute black in the vegetable kingdom."

HORTICULTURAL EDUCATION.—The following is the scheme for forty lectures prepared by a committee of the Fruit Growers' Association, and favourably entertained by the Education Department:—*First Stage.* Plant Life.—Seeds, Nature of, and Germination: requirements of growth, water, heat, air. Soils: nature and composition. Roots: nature and functions; branches, fibrils, and root hairs; what they do, and how—what helps, what hinders them. Stems and Branches: their nature; work and uses; helps and hindrances. Leaves: what they are, what they do; helps and hindrances. Buds and Tubers: leaf-buds, flower-buds, tubers. Growth: increase in size and changes of composition; formation and storage of food materials. Flowers: their component parts; what they do. Fruit: changes and development during ripening; forms and varieties, as Apple, Strawberry, Plum, &c. *Second Stage.* Elementary operations.—Description and use of implements under each head.—Operations connected with the land, with explanations and illustrations of good and bad methods: digging and trenching; draining; hoeing, stirring the soil, and weeding; watering. Preparation of seed bed: rolling and raking; sowing, transplanting, and thinning. Potting. Planting: positions and shelter; staking; earthing and blanching. Propagation. Elementary principles: cuttings; budding; grafting; layering. Insect and fungus pests. *Third Stage.* Advanced practice.—Budding, Grafting, and stocks used. Layering. Division. Branch pruning. Root pruning: old and young trees and bushes. Fruit culture: open air and under glass; small fruits; Apples and Pears; Stone fruits; gathering and storing; packing and marketing. Vegetable culture: tubers and roots; green vegetables; fruits and seeds (Peas, Beans, &c.); rotation of crops. Flower culture: outside and under glass. Manure and application. Treatment of insect pests; treatment of fungus pests. General knowledge of fruits.

AN IMPORTANT EXPERIMENT IN AGRICULTURAL EDUCATION has been started in the rural districts of Kent. In upwards of sixty villages, courses of six lectures on elementary scientific subjects bearing upon agriculture are in progress by University lecturers on the model of the University Extension movement. The lecture, the class, the syllabus, the oxy-hydrogen lantern, and the travelling libraries, the chief features of University Extension, are all put in action. In addition, local teachers will be authorised to give supplementary instruction in the intermediate weeks, since, owing to the large area to be covered, the University lecturers can only visit a given village once a fortnight. The lecturers on agricultural chemistry are:—Mr. F. M. Legge, of Trinity College, Oxford; Mr. H. H. Cousins, of Merton College, Oxford; and Mr. R. S. Morrell, of Caius College, Cambridge. Mr. W. F. H. Blandford, of Trinity College, Cambridge, lectures on Injurious Insects; Mr. A. S. F. Grünbaum, of Caius College, Cambridge, on Physiology; Mr. W. B. Bottomley, of King's College, Cambridge, on Plant Life; and Mr. P. Lake, of St. John's College, Cambridge, on Agricultural Geology. The funds are provided by a grant of £3000 from the Technical

MESSERS. KRELAGÉ'S FIELD OF DARWIN TULIPS.

Education Committee of the Kent County Council. This is the first systematic attempt, says the *Gardeners' Magazine*, to bring before rural audiences some of the elementary scientific principles which underlie their daily work, and we trust that young gardeners will take full advantage of the lectures and class-teaching.

LINNEAN SOCIETY.—The first Meeting of the Session 1891-92 will be held on Thursday, Nov. 5, 1891, at 8 P.M., precisely, when the following Paper will be read:—"A Theory of Heredity based on Force instead of Matter." By the Rev. Prof. HENSLow, M.A., F.L.S. Fellows having any objects for exhibition on that evening are requested to communicate the previous day with the Assistant-Secretary, that they may be placed on the Agenda paper.

TECHNICAL EDUCATION IN HORTICULTURE.—The draft scheme for the establishment of twenty-five scholarships at Swanley Horticultural College, has now been prepared by the Kent Technical Education Committee. Fifteen of the scholarships are to be of the value of £60 per annum, and ten of the value of £30 per annum. They are to be tenable for two years. Ten of the students for the £60 scholarships are to be selected from pupils or past pupils of elementary schools within the meaning of the Elementary Education Acts; and five from teachers, assistant-teachers, and pupil-teachers in such schools. The students for the £30 scholarships are to be selected from persons (other than the above) belonging to the industrial classes, who are to be required to pay half the fee of £60 per annum, the other half being paid by the committee. This class includes the children of all persons who are in receipt of less than £400 a year. The candidates are to be of not less than sixteen, nor more than twenty years of age on January 1, 1892. The county is, for the purpose of the scheme, to be divided into twenty-five districts (fourteen urban and eleven rural), each district being entitled to nominate five candidates, and (except in certain specified events) to have one of those candidates maintained as a scholar at the college. Out of these nominated candidates, scholars are to be selected by the committee, according to the result of an examination to be conducted under the direction of the committee.

THE WHEAT CROP OF 1891.—Sir JOHN LAWES has kindly furnished us with a communication on this subject, from which we take some extracts. After dealing with the climatal features of the harvest year, and their effect upon production, Sir JOHN gives a table, showing the yield on various plots, manured and unmanured, calculated on the supposition that the bushel weighs either 61 lb., as was heretofore supposed, or 60 lb., as now adopted by the Board of Trade and Board of Agriculture. "The permanently unmanured plot gives a yield of 13½ bushels per acre, being half a bushel more than the average of the last ten years, and this plot, which has been unmanured for fully half a century, is supposed to give at the present time a crop of Wheat per acre fully equal to the average crop of the world. The plot manured every year with 14 tons of farmyard manure, gives a produce of 48½ bushels per acre, 11½ bushels over the average of the last ten years, and only 1½ bushel below the great produce of this plot last year. The three artificially-manured plots do not differ much in yield, which is 40½, 40, and 42½ bushels per acre. The weight of the bushel is very uniform over all the plots, but in no instance does it exceed 58 lb. per bushel, the average of the last ten years having been 60½ lb. It is worth noticing, that, although by means of high manuring with farmyard dung, an increase of 35 bushels of Wheat has been obtained over the unmanured land, the weight of the bushel is very nearly the same upon both plots, thus proving that farmers have greater power to increase the yield of their crops than to improve the quality of their produce. In all the experiments, the quantity of straw was very great. Calculated in the usual way, the Wheat crop of the present

year gives a mean produce of 34½ bushels per acre; or, if calculated according to our custom upon a basis of 61 lb. per bushel, a yield of 32½ bushels per acre. Formerly, the Board of Trade assumed 80·77 parts of imported Wheat, flour, and meal to represent 100 parts of Wheat grain; but now 72 parts of imported flour are reckoned to be equivalent to 100 parts of Wheat. It is obvious that if both imported and home-grown Wheat are to be taken at only 60 lb. per bushel, the weight of both imported and produced Wheat will represent a higher number of bushels. Further, if 72 parts of imported flour are now to be reckoned as equivalent to 100 parts of Wheat, the estimated import of Wheat in that form will be so much the higher. Whilst the population to be fed has been considerably less than has been estimated, the amounts of Wheat, and flour equal Wheat, imported, have been in excess of the estimates of them. Adopting both these assumptions as correct, it is obvious that the consumption for all purposes has been greater per head of the population than we have hitherto assumed. We have for many years past assumed that the consumption of the United Kingdom was equivalent to 5·65 bushels, at 61 lb. per bushel, per head of the population. In view of the changes already alluded to, will it not be expedient to take, provisionally, the round number of 6 bushels per head, at 60 lb. per bushel, for some years, until experience shows how far the altered estimates are borne out? Last year we concluded our report upon the Wheat crop with the following sentence:—"It would appear probable, therefore, that the quantity required to be imported for consumption within the current harvest year will be about 18 million quarters, rather more or rather less, according to the turn out of the home crop." The actual nett imports amounted to a few thousand quarters over 18 millions, or, according to the figures now adopted by the Board of Trade, to rather more than 18,800,000 quarters. The season has been competent to produce very large crops, probably not much inferior to those of last year in the number of bushels per acre, but of a very much lower weight per bushel. I am therefore disposed to adopt a yield of 30 bushels per acre, of a weight of 60 lb. per bushel, as the yield of the Wheat crop of the United Kingdom for the season of 1891. Taking the population at the middle of the harvest-year 1891—2, at 38,034,615, and adopting the consumption at 6 bushels per head, our requirements will be 28,525,961 quarters. Our home produce I estimate at 9 million quarters, and deducting 2 bushels per acre for seed, a consuming quantity at rather more than 8½ million quarters, leaving our requirements for imported Wheat to amount to 20 million quarters."

BRIGHT COLOURS IN AUTUMN FOLIAGE.—"JOS. PH. WHARTON long ago explained that when sap ceases to flow in the fall, and the natural growth of the tree ceases, oxidation in the leaves takes place," says *Mechan's Monthly* for September. "Under this oxidation the leaves change to red, or, with a slight change of the condition, it might be yellow or brown. This, however, is only the chemical explanation. Life, or as we would say, vital power, has to bear a part. If a branch is entirely cut off from the main plant, no change of colour occurs. On the other hand, if a branch is injured, though not entirely cut off from the tree, a change of colour takes place, even if it be midsummer. In other words, chemistry alone cannot account for the bright colours of autumn foliage; the mysterious power we call life has to work at the same time."

THE BIRMINGHAM GARDENERS' ASSOCIATION.—Mr. HARRY J. VEITCH, of the Royal Exotic Nurseries, Chelsea, opened the Winter Session of the Association in the large room of the Midland Institute, with a lecture on "A Visit to Greece," with views illustrated by limelight, by the aid of a lantern. There was a large attendance of members, and Sir THOMAS MARTINEAU, the President of the Association, presided. Mr. and Mrs. VEITCH recently took a three months' tour through Corfu and Greece, and

Mr. VEITCH gave an animated and instructive narrative of their journey. Mr. VEITCH described the various objects illustrated, and spoke with admiration of the grandeur of the ancient buildings and the beautiful sculptures. The horticulture of Greece was barely touched upon, on account of there being but little existing, the want of water for garden purposes being very great; but he intimated that the Cypress, *Laurostinus*, *Phoenix serrulata*, *Euonymus*, and *Pinus halepensis* were amongst the trees and shrubs most generally met with, and that Peaches, Apricots, and Figs were very common. A cordial vote of thanks was passed to Mr. VEITCH, proposed by Sir THOMAS MARTINEAU, in eulogistic words, seconded by Mr. W. B. LATHAM; and Mr. VEITCH, in his reply, gave some excellent practical advice to the young gardeners present.

RUST IN WHEAT.—It is calculated that Australasia loses annually nearly 2 millions sterling through the rusting of its Wheat crops, says the *Mark Lane Express*. To find a remedy for it, a prize of £10,000 has been offered for a successful preventive, and rust conferences have been held in Sydney. The opinion prevailed generally that "certain sorts of Wheat are much better able to resist rust than others, and that by judicious cultivation and hybridisation still better varieties may be grown. They seem to be almost unanimous that early maturing sorts can be made to escape the dangerous season, and that rust is due to climatic conditions that can only be combated, but never entirely overcome." In regard to curative measures, it has been found that a solution composed of one part of sulphate of copper and 400 parts of water destroyed the vitality of the rust spores, and that a solution of 1 oz. of sulphate of iron to the gallon of water when sprayed over a growing crop at a time when rust was about to break out, prevented its appearance until a fortnight or three weeks later; and even if applied when the rust had attacked the plant, destroyed all outward appearance of the fungus, and prevented its re-appearance till 14 days afterwards. Mr. SMITH ELLIS, who has claimed the £10,000 for his discoveries in the matter of rust prevention, says in a recent paper that "the wheat-growers themselves are the sole propagators of rust by the abuse of their seed Wheat. When they cease to abuse their seed Wheat, and treat it in a rational manner, like all other seed that is grown, saved, and stored by practical seed-growers, they will no longer be troubled with rust in their crops. The cost of doing so is nothing; care is all that is required to secure that object."

THE CHICAGO EXHIBITION, 1893.—The *Journal of the Society of Arts* gives full details of the progress and prospects of this gigantic undertaking. The site of the exhibition is at Jackson Park, an area of 800 acres, 6 miles from the centre of the city, on the shores of Lake Michigan, between it and the Illinois Central Rwy. The amount of money available from different sources amounts to nearly £5,000,000! Of this, Great Britain finds £20,000, while Japan supplies £100,000, and Mexico as much as £150,000. Rather more than £218,000 have been expended up to the end of September, the cash in hand being at the same time over £391,000. To the northward is the great Horticultural Palace, around and near which sufficient space is left to allow for out-of-doors display of plants and flowers. Little need be said about this building, except that it forms a conservatory on an enormous scale, measuring 250 feet by 1000 feet, with a large and lofty central dome. Extensive as is the space enclosed by this glass and steel structure, it has already been applied for, and will prove quite insufficient for the horticulturists and floriculturists of the United States. Space has been reserved for the erection of many other smaller glass-houses, and chiefs of the floricultural department of the Exhibition anticipate that much support will be given them by British floriculturists, who have extensive business relations with the United States. The Agricultural Hall occupies a space of 800 by 500 feet; that for fores try

500 by 200 feet. The wooded island in the lagoon, which will be one of the principal ornamental features of the ground, is already partially timbered, and its surface is accentuated enough to throw it into considerable relief. The work of planting the island with indigenous trees will be carried on until it becomes an exhibit of American forestry. No buildings will be allowed here, but the island will be accessible to the public.

THE IRRIGATION COLONIES OF VICTORIA.—We have received from Mr. E. C. GATES, 21, Finabury Pavement, a pamphlet descriptive of the Irrigation Colonies of Victoria, and of the openings afforded for hard-working emigrants who can afford the small sum needed to buy a farm therein. The irrigation scheme originated in California. There, large tracts of land so arid as to be quite useless for agricultural purposes, were, by an elaborate arrangement of aqueducts and canals, watered with supplies brought from distant rivers and mountain reservoirs. The success of the experiment, and the pecuniary results which followed it, were quickly seen, and from Australia engineers were sent to learn the details of the system, and apply it to the dry regions of their own colony. The irrigation scheme proved equally successful in Victoria, where many once-barren acres are now turned into rich farm land, where fruit and other crops can be successfully raised by large or small owners. Many farmers now struggling against over-competition and adverse climate might do wisely to emigrate and buy for about £12 an acre land which, properly managed, is very productive. Many of the farms are so conveniently situated that the cost of transit of stock is small, while there is always a ready market for really good produce.

"ICONES PLANTARUM."—The last part comprises illustrations of many plants most interesting from a botanical point of view. They are to a large extent of Chinese or of West African origin. Some, such as *Eranthum polyanthum*, t. 2000, from the Patkye mountains, between Burma and Assam, are well suited for introduction as garden plants. The curious central Chinese *Pedicularis vagans*, with broad Fern-like foliage, and runners like those of a Strawberry, would be well worth introducing, and *Carpinus laxiflora* should be looked after by lovers of trees. Emeritus Professor OLIVER is the Editor of this most useful record.

SPIRAL TORSION.—Prof. HUGO DE VRIES has published in a separate form, and with numerous illustrations, his elaborate monograph on this subject, under the title of *Monographie der Zwangsdrehungen*, *Psilotum triquetrum* (stem), *Banksia marginata* (leaves), may be added to the numerous examples given or cited by the author.

GLASNEVIN.—The official report for 1890 of the Director of Science and Art Museum, Dublin, speaks of the Royal Botanic Gardens, under the charge of Mr. F. MOORE, as being in a very satisfactory condition, the chief want being the long-asked-for house for succulent plants. The increase in the wages of the gardeners and labourers during the year "was a well-deserved recognition of their claims to participate in the general rise which has taken place in wages. Purchases of plants to the amount of £241 19s. 2d. were made during the year, and exchanges to at least the same amount have been made. The number of donations was 126. Musical promenades are held in the gardens, the average attendance being 2235. The total number of visitors to the garden during the year amounted to 375,000, of whom no fewer than 274,201 were present on Sundays.

THE INFLUENCE OF PINE TREES UPON TEMPERATURE, ETC.—The *Echo Agricole* says, it is really astonishing that the resinous trees are so little used by gardeners and others as a protection against the north and north-easterly winds. Such trees are of incontestable value in protecting early plants and vegetables, and it has been observed that gardens which are systematically protected with them are

always a fortnight in advance of others which are more exposed to the cold winds and late frosts. There is not a garden which cannot be made more productive by a systematic protection with Pine trees. Pines and Firs perceptibly keep the temperature in their immediate neighbourhood slightly higher, besides breaking the force of the wind by their thick branches. Anyone can demonstrate this elevated temperature by making a few observations with a common thermometer; it is by no means rare to find a temperature as different as that of March and that of May. Everyone knows how bad cold is for young plants, and it seems by taking such natural precautions as the planting of resinous trees in the proper quarters, a great deal of early damage may be avoided.

THE DESTRUCTION OF ROSE PESTS.—Mons. MENART BOUREAU, of Suèvres (Loire-et-Cher), makes the following communication to the *Journal des Roses*:—"In July, when I was treating my Vines against the mildew, the idea occurred to me of employing the same insecticide for destroying the insect pests which affected my Roses. Consequently, I syringed the trees with a liquid composed of the following ingredients, with the result that a few hours later all the insects were in a dead or dying condition, and had fallen off the leaves:—Ammonia, 1 kilogramme; sulphate of copper, 2 kilogrammes; water, 200 litres." Amateurs whose Rose trees get infested with insect life are recommended to try the same experiment. But a simple solution was recently recommended by *La Nature*. It consists in taking crushed wood-ashes, and sifting them dry in a fine condition over the heads of the trees immediately after they have been syringed with water. The wood-ashes adhere to the leaves, and on account of their alkaline nature, soon make it uncomfortable for any insect pests that may be there. The ashes do not injure the trees; on the other hand, when they have been syringed off with water again, they fertilise the soil.

POISON IN ARTICHOKE LEAVES.—A communication has recently been made to *Cosmos* by Mons. PAUTHIER, of Senlis, concerning a very curious fact which he has observed. There has been, hitherto, no reason for believing that any part of the globe Artichoke plant has a toxic effect upon the human economy when taken directly, yet should cows accidentally partake of the leaves, their milk for the time being becomes distinctly dangerous to health if used by children, or others of weak digestion. The symptoms are those of poisoning, the patient vomits and suffers from diarrhoea. Chemical analyses of the leaves, and of the affected milk, has revealed the presence of a substance which is known to chemists by the name of cyanurin. Obviously, care should be taken not to feed cows, or to allow them accidentally to feed on the leaves of Artichoke, because their milk for some hours afterwards contains a noxious principle which is capable of causing serious complications in the system of a person, especially a child, who should partake of it. Moreover, there is no particular reason why cows should be allowed to eat Artichoke leaves, even when there are plenty of them, because as a food they possess a low value.

ARMERIA GADITANA.—In the last issued part of Dr. WILKOMM'S *Illustrations Flore Hispanie*, &c., is a coloured figure, t. 159A, of this "superb plant" known to TOURNEFORT, and accurately defined by BOISSIER after having been confounded with *A. latifolia*. It is a native of Southern Spain, and the corresponding districts of Portugal, while a variety of it occurs in Morocco. The leaves are large and leathery, lanceolate acute. The flowers white, in a large head, at the end of a naked stem.

GUTTA-PERCHA TREES AT SINGAPORE.—The *Kew Bulletin* for September contains a note on the re-discovery of this tree, now known as *Dichopsis gutta*, in the Island of Singapore. It was originally discovered in 1842 by Dr. MONTGOMERIE, and the gum was employed to insulate telegraph wires, for

which purpose no other substance has yet been found so good. The tree was supposed to be extinct, but it has been re-discovered by M. SERULLAS, who proposes a method of extracting the gum from the prunings of the tree instead of by the ruinous process of felling the tree and draining it of its milky juice.

THE LEEWARD ISLANDS.—On the nomination of the Director of the Royal Gardens, Kew, Mr. C. A. BARBER, late University Demonstrator of Botany in the University of Cambridge, has been appointed Superintendent of the Botanical and Agricultural Department in the Leeward Islands.

AGRA.—Also, on the nomination of Kew, Mr. WESTLAND, of Hong Kong, has been appointed Superintendent of the Taj Gardens, at Agra. Mr. WESTLAND'S position at Hong Kong has been filled up by the appointment of Mr. W. J. TATNER, from Kew.

HYBRID WHEATS.—The *Rural New Yorker* of the 12th ult. contains some striking illustrations of cross-bred Wheat, and still more remarkable figures of true bigeneric hybrids between Rye and Wheat obtained by Mr. E. S. CARMAN. The crosses selected for perpetuation are, of course, those best adapted to the conditions and requirements of the several States of the Union. Seed is placed on the market by Messrs. THORBURN & Co.

CATALOGUE OF HARDY PERENNIAL AND BIENNIAL PLANTS.—Professor WITPROCK and M. HANS OSCAR JUEL have compiled a very full catalogue of the plants above named, which are cultivated in the open air in the Botanic Garden of Berg, Stockholm. The plants have been obtained largely from seed supplied by other botanic gardens, but the authors lament that scarcely one-half were correctly named. Great care seems to have been expended on the present Catalogue, to which are added botanical notes in Latin relating to some of the more interesting plants. A curious variety of the Spruce is figured, *Picea excelsa* var. *acutissima* (p. 79), which originated as a seedling. It is of very dwarf habit, and slow growth, and the leaves relatively long, very acute, and much flattened at the sides.

HYBRID BETWEEN CRINUM AND HIPPEASTRUM.—In the October number of *Mechanics Monthly*, Mr. OBERSWELLER, of Austin, Texas, narrates how he has raised a hybrid out of *Crinum Kirkiti*, fertilised by pollen of a hybrid *Hippeastrum*. Further details are required as to the progress of the cross, if it really be one.

ORCHIDS AS CUT FLOWERS.—The *Journal des Orchidées* is about to take the votes of its readers with a view to ascertain which are the best twelve Orchids to grow for market as cut flowers.

HEMP AS A DEFENCE AGAINST WEEVILS.—Mr. J. B. HELLER of Graham's Town, writing in the *Agricultural Journal* of the Cape Colony, September 24, p. 71, says, that the "comings of the Hemp produced in the manufacture of the fibre are used as a protection against the attacks of weevil on the "Mealies" Indian Corn. The leaves of the Hemp are merely placed about and amongst the bags and heaps of grain.

SCALE INSECTS.—Mr. ARTHUR SHIPLEY, Christ's College, Cambridge, makes known, through the *Kew Bulletin*, his desire to receive specimens of scale insects and nematode worms affecting plants. The September number of the *Bulletin* contains an article from his pen on the Orange scale in Cyprus.

MYLES MEMORIAL FUND.—We have already alluded to the decease of this gentleman, at a comparatively early age. Unfortunately, he was unable to make any provision for his widow. The Selborne Society has, therefore, issued a special appeal to all its members, but would also do so generally to any other persons who may feel disposed to contribute to the fund. As many of our own readers have doubtless profited by Mr. MYLES' admirable *Pronouncing Dictionary of Botanical Names*, appended to

NICHOLSON'S *Dictionary of Gardening*, it is hoped that they may like to contribute to the fund. The Rev. Professor G. HENSLAW, Drayton House, Ealing, W., will be glad to receive any communications.

M. DE LA DEVANSAYE.—The Horticultural Society of Angers, and Maine and Loire, have presented to M. DE LA DEVANSAYE his bust, in commemoration of his twenty years' Presidency of the Society. M. DE LA DEVANSAYE is well-known as an ardent horticulturist, and as the raiser of several new and remarkable *Anthuriums*.

TODDY PALMS.—Adverting to the excellent woodcut published at p. 105, and for which we are indebted to Mr. GOLDRING, the editor of the *Tropical Agriculturist* says, that in the case of the Toddy Palms of Ceylon, the juice is obtained, not from the stem, but from the unopened flower-spathes.

ORCHID-GROWING IN ENGLAND.—The October number of the *Journal des Orchidées* contains an account of the Orchid-houses of Mr. STATTER, of Manchester. The writer, M. LUCIEN LINDEN, goes into detail, and is very eulogistic.

ETIENNE LEVET.—Many Rose growers will regret the record of the death of this distinguished rosarian. M. LEVET died at Lyons on August 21, in his 75th year. Among the Roses raised by him we may specially recall Paul Néron, Belle Lyonnaise, François Michelin, and others.

THE CULTIVATION OF THE PEACH.—Mr. R. HONEY, of Sunderland, read an interesting paper before the members of the Newcastle and District Horticultural Mutual Improvement Society in one of the rooms of the Literary and Philosophical Institute, Newcastle, the subject being "The Cultivation of the Peach and Nectarine," on October 15. Mr. BARNARD COWAN, of South Shields, presided, and there was a fairly numerous attendance. Mr. HONEY, in the course of his paper, said that when cultivating the Peach against a wall, it is preferable to have the wall of brick rather than stone, as it is warmer; and it is advisable [in the Midland and Northern Counties. Ed.] to build flues in the walls. For the borders, a sound and dry sub-soil is required. Many trees have been ruined by the borders being too deep, too damp, or too rich. From 2 feet to 2 feet 6 inches is the proper depth, and a good hazel loam is best; but whatever the soil, it should be of a texture slightly adhesive. As to manure, the trees should be top-dressed every year in May. Fan-shaped trees should be planted 20 feet apart as permanent trees, but riders can be planted between them for cropping for a few years, the riders to be finally discarded. The paper then went on to give instructions as to the thinning of the fruit, preserving the trees against red spider, and various diseases, such as gumming caused by wounding the trees, mildew, and blistered leaves, &c. It also deprecated the brushing off of the foliage in autumn. The chairman, Mr. COWAN, said he considered there was a great future before their own and similar associations. Statesmen were just now deploring the conditions under which agriculture was pursued. There was fully as much to be said for horticulture. In this respect he thought they might, at some not very distant day, be assisted by the County Councils. A great deal of the foreign garden produce brought into Newcastle might, he thought, very easily be grown in the district. He hoped the President of the Board of Agriculture would recognise gardeners, as he had already done farmers. Railway transit was a great difficulty in this country. He (Mr. COWAN) knew of a Strawberry farm near Alnwick which paid very well, but the fruit from which had to be sent to Glasgow instead of Newcastle because the carriage was cheaper.

FLORICULTURE IN THE STATES.—The United States *Census Bulletin* just issued, notes that floriculture in the United States has come to be simply the growing of a few things for cut flowers, says *Meehan's Monthly* for September. It has found that there are 4559 greenhouse establishments in the United

States, and that the total number of plants raised is about 125,000,000; of these, 49,000,000 were *Rose* alone, and the rest were made up of plants in the following order:—*Violets*, *Chrysanthemums*, *Lilies*, *Hyacinths*, *Smilax*, *Bouvardia*, *Heliotropes*, *Pansies*, and *Tulips*. These together make 90 per cent. of the whole of the plants raised. The other 10 per cent. were made up of *Orchids*, *Tuberose*s, *Mignonette*, *Primroses*, *Camellias*, *Daffodils*, and a few other scattering things. Three hundred and twelve of these establishments are owned and managed by women. The value of the greenhouses, including heating apparatus, is placed at 38,000,000 dols. For outdoor gardening the demand has been in a great measure confined to *Pelargoniums*, *Coleus*, *Roses*, *Pansies*, *Verbenas*, *Heliotropes*, and *Carnations*. Among all the large classes of florists' flowers, the *Fuchsia* is the only one noted as being grown in sufficient numbers to be worth naming. When it comes to a matter of profit the report says, that *Roses* have been the most profitable, the *Carnations* next. Some few florists, however, speak of the *Carnation* as being more profitable than *Roses*.

CIRENCESTER CHRYSANTHEMUM SHOW.—One of the newest of the Societies established for the purpose of encouraging the cultivation of the *Chrysanthemum* is Cirencester. The schedule before us exhibits a locally well-supported Society, and that *sine quâ non* of a country show, a fairly good list of prizes offered in the various classes. Fruits and vegetables likewise find place at the show which will be held on November 11 and 12.

THE BEHAVIOUR OF TANNIN IN PLANTS.—Experiments were recently made by BUSGEN, a German botanist, in order to determine whether a disappearance of tannin in any parts of plants can be shown to take place; the results were reported in one of our German contemporaries, *Forsch. Gebiete. Agrik. Physik*, xiii, p. 305. A distinction has been made by KRAUSS between "primary" tannin, which is produced with, and "secondary tannin," which is produced without, the intervention of light. In certain cases both kinds were found to disappear. Tannin was also found to disappear from cells which were on the point of dying, as well as from cells possessing more vitality. BUSGEN doubts whether it is again used in building up. Direct proof of the production of tannin from sugar, in a manner similar to the formation of starch from sugar, was obtained. Portions of shade-leaves of various plants were placed with the upper side on a 10 per cent. solution of Grape-sugar, the chief veins having been cut to facilitate the entry of the solution. Portions of the same leaves were similarly placed on pure water. The latter showed no increase of tannin after four or five days, whilst those in the sugar solution showed a notable increase. It has still to be shown what intermediate products are formed when sugar is converted into tannin, and also whether other substances will give rise to it.

THE DEVON AND EXETER GARDENERS' ASSOCIATION.—The above, formed less than a month ago, has begun its session in sober earnest, and if it can be carried on with as much spirit and energy as it has shown at the beginning, there is probability of its being established on a firm basis, and of its serving a most useful purpose. Under the chairmanship of Mr. Alderman ROBERTS, the first meeting was numerously attended, and Mr. D. C. POWELL, of Powderham Gardens, read an excellent paper on "Apples." The paper evoked a spirited discussion, in which Mr. VERTCH and others took part.

CATTLEYA LABIATA, Lindl.—Much has been said and written of late respecting what is known in gardens as "*Autumn-flowering labiata*." As examples of what clever collecting and quick consignment can do, MESSRS. SANDER exhibited at the Royal Horticultural Society, on October 27, grand masses, some of them with a hundred bulbs, fresh imported, and with plenty of good dormant eyes, and thick healthy leaves. In connection with

the exhibit, a curious matter came out as to its introduction. It appears, that in the spring of 1890, Mr. SANDER saw in the collection of Mr. E. MOREAU, at Paris, some *Cattleyas* which had been sent to him from Brazil. With the pardonable scepticism of one who had already spent thousands of pounds in searching for true autumn-flowering *Labiata*, Mr. SANDER refused at the time to acknowledge the claims of the plant to be the long-sought species, to be correct. However, he could not get the matter off his mind so easily, and soon afterwards thoroughly sifted the subject, and sent ERICKSON, one of his hardest and most reliable Orchid collectors to the spot indicated, and in due time received a great supply of which those referred to above are the last arrivals and the best. There was one white flower, one which opened in the case, but it is most likely that albinos will be rare in this species.

CHESTNUT TREE STRUCK BY A FIRE-BALL.—During the storm on October 14, a fine Chestnut tree standing in the grounds of Mr. YATES NEILL, of Ealing, was struck by a fire-ball. At the time of the accident a gardener was sawing off a branch broken by the wind of the previous night. He, as well as two gentlemen who stood near, felt the shock severely, but sustained no permanent injury. According to a local contemporary, the trunk of the tree "presents the appearance of having been burned in a zig-zag direction for a distance of some 20 or 30 feet."

MESSRS. SUTTON & SONS' EXPERIMENTS WITH BORDEAUX MIXTURE.—It is needless to say that the results of the above, alluded to in the *Gardeners' Chronicle* last week, has taken us by surprise. From France, Belgium, Germany, and especially from America, we have heard of nothing but success attending the copper treatment. Nay, more, from all we have heard up till now, of experimental work, both on a large as well as a small scale, in Great Britain, the result has been the same, all tended to confirm our most sanguine hopes. Leading alone sounds the unwelcome note of failure, and sends forth a wail of disappointed hopes. One swallow generally does not make a summer, so one failure must not dishearten us. The very fact of it being the only failure yet recorded ought rather to stimulate our interest. Why should MESSRS. SUTTON alone have failed—failed not in checking the disease: but failed practically by lessening the productiveness of the plants. Naturally, those interested in the subject are not slow to meet the case. Mr. W. WHITEHEAD COUSINS, writing to a contemporary, the *Agricultural Gazette*, brings forward some most important facts, which cannot fail to be of interest to your readers. Like MESSRS. SUTTON'S tables, his letter is too long for reproduction, but unlike these, does not contain detailed minutiae of a single experiment—for such theirs really is—it being the application on three successive dates of one strength of the mixture upon a vast number of varieties of Potatoes growing together in the same place under the same conditions of climate and cultivation. Mr. COUSINS quotes the fact that the six 2-acre plots dressed three times with a 2 per cent. mixture in various parts of the kingdom under the auspices of the Royal Agricultural Society, and 9 acres of Regents at Sittingbourne dressed twice with a 2 per cent. mixture, have none of them received any injury. That produce of the Royal Agricultural Society's experiments plots weighed in Bedfordshire and Wales show a large increase in yield in favour of the treatment. The same he finds to be the case at Cliffe, at Spalding, at Bendly (Worcestershire), at Cheddington (Bedfordshire), at Stittingborne, in the Isle of Axholme, at Edinburgh, and at Arbroath: no injury to the plant and an increase in the yield. Surely these results "ought to outweigh the one trial at Reading." Of course the point is, why did the Reading experiment not turn out a success? Many reasons naturally suggest themselves, but in the absence of knowledge of details of the experiment, it is hardly worth while to speculate. We hope

at an early date to learn some of these details, and I have no doubt that we shall see the cause was not so very far to seek after all. *Charles B. Plowright, M.D.*

[We have received numerous comments on Messrs. Sutton's experiments, which appears to be at variance with those of other experimenters. Next week we may find room for some of these. Ed.]

SCOTLAND.

NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

THE members of this Association held their first meeting of the winter session in the Christian Institute Hall, Aberdeen, on Wednesday evening, the 21st inst. There was a good attendance, and Mr. D. M. Smith, the retiring President, occupied the chair at the opening of the proceedings. On the motion of Mr. C. S. France, it was unanimously agreed that all apprentice gardeners, foresters, &c., be admitted to the Association, and their annual subscription to be 1s. In the discussion, it was stated that no class required technical education more than gardeners, and yet they were far behind in this matter. Mr. C. S. France, the newly-elected President, then took the chair, and proceeded to deliver his opening presidential address. At the outset of his remarks, Mr. France returned thanks for the honour which had been done him in appointing him President. After a reference to the high ability of his predecessor in office, he went on to say that he was inclined to think that they had been neglecting the scientific side of their profession, and going in too much for the practical. He thought they ought to make their programme a little more varied and comprehensive. He impressed upon them the advantage of careful observation of every freak of Nature that might come under their notice, and advised them to bring such matters before the Association for discussion and solution. In regard to what he had suggested with reference to the widening of the scope of the Association, what he particularly advised was, that papers should occasionally be given on such subjects as botany, vegetable physiology, geology, mineralogy, the nature and quality of soils, chemistry, entomology, and meteorology. He also directed their attention to the importance of landscape gardening. The library of the Association might also be extended. He further suggested, in view of what he had said in connection with extending the usefulness of the Association, that a slight alteration might be made in the name of the Association, by tacking on arboriculture. They had many foresters in the Association, and he saw no reason why subjects relating to that department should not be discussed. The name of the Association he proposed was, "The North of Scotland Horticultural and Arboricultural Association." He concluded by throwing out the following additional suggestions:—That there should be four grades of membership: first, proprietors; second, factors and nurserymen; third, gardeners and foresters; and fourth, assistant gardeners and assistant foresters; that a proportion of the funds be voted as for prizes, for essays, or for objects such as herbaria, collections of cones, woods, or meritorious exhibits in either horticulture or arboriculture; that, in addition to the monthly meetings, a meeting should be held annually in September or October, of the nature of a conference, at which the prizes might be awarded and papers read on any given subject of general interest; that excursions should be organised to gardens and other places of horticultural and arboricultural interest in the neighbourhood; and that the meetings of the Association should be made so attractive as to induce all members to come forward and share its work.

At the close of his address, Mr. France received the hearty thanks of the meeting. A paper was then read by Mr. R. Farquhar, late of Fyvie Castle,

Aberdeenshire, on "Some Impressions of America," for which the thanks of the Association were also accorded. The proceedings then terminated.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN: ANNUAL MEETING.

THE annual meeting of this Society was held on Saturday, the 17th inst., in the Music Hall Buildings, Aberdeen, Baillie Crombie, chairman of the directors, in the chair. The following was the report:—It is with deep regret that the directors have to refer to the lamented death of their late chairman, Mr. James Murray Garden, Advocate, whose warm interest in the Society was so well-known.—The Society held a spring exhibition in the Music Hall Buildings on April 10 and 11. The exhibition was an admirable one; but, from a succession of unforeseen circumstances, the financial result was not a favourable one. The annual floral *fi*te was held in the Duthie Public Park on August 20, 21, and 22, and proved most successful, both from an exhibitors and from a financial point of view. The entries numbered 1731, as against 1607 for the previous year. The exhibits were the finest that have been shown for a good many years. The financial surplus on the year amounts to £63 13s. 4d., which, added to the balance brought from last year, makes £251 9s. 10d. at the credit of the Society. The best thanks of the Society are due to the Aberdeen Town Council for granting the use of the Duthie Park; to Dr. Dove Wilson and Baillie Lyon for their services in connection with the opening of the Exhibitions; and to Professor J. W. H. Trail for his interesting lectures at the spring show. The chairman moved the adoption of the report, Baillie Lyon seconded, and in doing so, said it was satisfactory to find once more that the balance was on the right side, and that but for that most unfortunate venture, the spring show, they would have had a very much bigger one. He was one of the parties that opposed very strongly having a spring show—not against a spring show itself, but against their risking it being a success; and they would see that the results of their spring show these last three seasons had been a most serious loss to the Society. He thought the Society should pause before it held another spring show until they had £1000 at their credit. Then they could afford to lose £80 or £100. The running of a spring show was a very risky thing indeed. It might be very desirable from the point of view of those who cultivated spring flowers, but theirs was not an advertising Society altogether. There was a Society to be carried on for furthering horticulture, but not at a serious financial risk. He thought the Society, having the experience of the past two years, should pause before it had another spring show. They would remember that he called their attention at the last annual meeting to the advisability of raising the price of admission to the show on Saturdays from 3d. to 6d., and he thought he could come there with very great satisfaction that night and say that his recommendation had been a great success. He said then, no exhibition worthy of going into could be got in the United Kingdom for prices of 6d., and much less 3d., and if they risked putting the admission up to 6d., he was quite sure the citizens of Aberdeen would encourage it. It was very gratifying indeed that they should find their balance amounting to £251 9s. 10d.

The report was adopted, and the meeting proceeded to the election of office-bearers for the ensuing year. Baillie Crombie was unanimously reappointed chairman, as was also the Secretary, Mr. A. M. Byres, C.A. The directorate remained the same as last year.

Baillie Lyon said they would have seen from the newspapers that the Incorporated Trades of Aberdeen had resolved to give off some of their land in small plots. Now, he thought it was worthy of the consideration of the directors to give some prizes for the best-kept plots of ground. He only threw this out as a suggestion. Mr. Robson, of Messrs. Smith & Son, expressed his approval of

the suggestion. Baillie Crombie then drew the attention of the meeting to a matter affecting the Society which had been brought before him. There had been placed in his hands the rules of a benefit society in Edinburgh, such as had been sometime ago spoken of in Aberdeenshire for gardeners, florists, seedsmen, and nursery *employés*. It was connected with one of the free gardeners' big bodies, and it was confined entirely to such as the Society was composed of. Baillie Crombie then gave a number of statistical facts as to the payments, benefits, and rules of the Society. Such a Society as this, he continued, would be exceedingly beneficial to the members, and than this Society there was no one he knew of in the profession in which they could get such advantages. The matter had been brought under his notice by Mr. Robson. He might say also that in Edinburgh the Society had been very successful. He was led to believe that the North of Scotland Horticultural Society would be very glad to join in any effort likely to be made in the direction indicated. It was agreed that the matter be remitted to the Directors for consideration. Votes of thanks terminated the proceedings.

LEMOINE'S HARDY HYBRID GLADIOLI FOR 1891.

NANCEIANUS SECTION.

HAVING described last year's novelties of this beautiful race of hybrids in these columns, I hope that some descriptive notes about this year's series may not be unacceptable to the readers of the *Gardeners' Chronicle*.

The set of novelties of the Nanceianus race of hardy hybrid Gladioli for this year consisted of seven varieties, and an eighth, not to be distributed till this autumn, was sent me a year in advance by the kindness of M. Lemoine. As this was the first to come into flower, it will head the list.

A. de la Devansaye, named after the well-known raiser of hybrid Anthuria, opened its first bloom on July 14, and is a fine tall vigorous grower, with branching flower-spike, and large fully expanded flowers (all looking the same way) of a most pleasing shade of light carmine, flaked with lake. The lower petals are most beautifully and evenly divided into three bands of colour, the inside deep carmine, spotted with white towards the throat of flower, then a broad band of pure white, and the outside a similar band of light carmine, altogether a most beautiful variety, and one of the finest of the whole family, which should be in every choice collection.

Professor Sargent opened its first flowers on July 21, and is a tall-growing variety, with a branching flower-spike, and large, fully-expanded flowers of a deep shade of carmine, with large and distinct blotches of creamy-yellow on the lower petals, which are spotted with carmine towards the throat of flower. This fine variety somewhat resembles President Carrot.

Ondine began to bloom on July 27, and is a variety of rather slender habit, with medium-sized, well-opened flowers of a dull, washy shade of red, flaked with purple, and marked and blotched in the same way as President Carnot, but, on the whole, a poor and inferior variety, though accorded some admiration by a few of my lady visitors, who pronounced its dull ground colour to be the æsthetic hue known as crushed strawberry.

Massena opened its first bloom on July 29, and is a vigorous growing variety of less than medium height of stem, bearing large handsome flowers of a pleasing shade of light red faintly flaked with carmine, and with large pure white spots on the lower petals, which are themselves spotted with carmine towards the throat of the flower—an exceedingly fine variety.

Dr. H. P. Walcott opened its first flower on August 5, and is a variety of medium height, with fine, large, well-opened flowers of a most pleasing shade of light red flaked with carmine, and irregularly mottled with white. The two lower petals are distinctly blotched, with creamy white,

Le Grand Carnot opened first flower on August 9, and is a fine vigorous tall-growing variety, with the largest and handsomest flowers of the whole lot. These fine flowers are of a bright shade of scarlet, faintly streaked with carmine, and with two large and most distinctly-marked blotches of pale canary-yellow on the lower petals. The flowers are more fully expanded than those of any other variety, and look you straight in the face. This grand variety should certainly be found in every choice collection.

Kleber began to bloom on August 13, and is a fine tall growing variety, with upright, unbranching spike, bearing large, well-expanded flowers, which also look you straight in the face, and are of a pleasing shade of light rose-colour, flaked with carmine, and distinctly blotched with pure white on the two lower petals. An exceedingly effective variety.

FIG. 70.—THE WHITE COMET-ASTER.

Harry Veitch, opened first flower on August 15, is rather a slender grower, with flower-spike of medium height, with medium-sized flowers irregularly disposed on the spike, and of the darkest shade of scarlet yet seen in this race, resembling that of *M. Duchartre* of last year. The lower petals are blotched with creamy-white, but the unfortunate depression of the top-centre petal, inherited from its *Sandersi* parent, and only markedly seen in this one variety of this set, prevents the beauty of the flower from being fully seen.

Goliath.—Opened first flower on September 20, nearly six weeks later than any of the other sorts, and is a good vigorous grower, with large tubular and not fully-expanded flowers of a deep shade of rosy purple, evenly flaked with carmine, and the lower petals veined with white. It may be that the extreme inclemency of the weather at the late season of its coming into flower prevented this variety from being seen to full advantage.

I may add to the above notes that, having been told by a horticultural friend (whose opinion I usually hold in the very highest estimation) who had visited *M. Lemoine's* garden in the autumn of 1889, that the flowers he saw there were so much larger in size, and brighter in colour, than those borne by the same varieties when grown in my garden, that he hardly recognised them when he saw them afterwards with me, I, this autumn, made the journey to Nancy, specially for the purpose of seeing for myself whether this were so or not, and whether Irish-grown flowers were really so inferior to those grown in sunny France as they were said by my friend to be. I am pleased to be able conscientiously to assert that, whatever the French flowers may have been in 1889, those I saw there this year were certainly not finer or brighter-hued than those in my own garden. The excessively severe and most abnormally prolonged

winter experienced last year in France, which prevented *M. Lemoine* from getting his bulbs into the ground till quite the end of May, may possibly have caused his plants to make weaker growths, and to produce somewhat smaller flowers this year than they usually do. *W. E. Gumbleton, Belgrove, Queens-town, Ireland.*

WHITE COMET-ASTER.

M. Chr. Lorenz, of Erfurt, sends us an illustration (fig. 70) of his white Comet-Aster. The flower, which resembles very closely a pure white large-flowered Japanese *Chrysanthemum*, is larger and more double than is usual, the petals being much longer and more twisted. Each petal is ribbed, giving thus to the flower a peculiarly elegant appearance. The colour is glossy satiny white. No doubt this Aster will become a general favourite.

HOME CORRESPONDENCE.

WHY SHOULD GARDENERS STUDY?—Kindly allow me a word in reply to "J. C. C." of Ponder's End. He doubts (p. 493), my advice being practical, but I can assure him that, broadly speaking, it is the men who study most to the purpose, that get on best in the battle of life. That old saying of Bacon's "Knowledge is power," was never so true as it is to-day, and especially so far as gardeners are concerned. I was born on a small farm, and am not ashamed to own to having milked cows, even as an under gardener! My first place was as a garden-boy at a shilling a day, and out of that I paid two shillings weekly to the gardener as an apprentice, and never did I spend such a small sum to so much advantage. Certainly I had some parental assistance besides my wages, but only in the form of food. Ever since I earned my first few shillings a week, I have always found it possible to spend a little on good books. I do so still, and I am quite sure that as an investment pure and simple the practice has repaid me. "J. C. C." asks if men who are hard-worked, or who have fallen on "hard times," would not feel their position all the keener if they had studied the books mentioned in my list (p. 461). My answer is, no! decidedly not! Education of the right kind is a blessing to the well-to-do, but it is ten thousand times a greater blessing to the poor. The kind of education that merely makes one dissatisfied is a bad education! But there is another side to the question, and one must be careful not to confuse causes with effects or results; but "J. C. C." and his young acquaintances may certainly take to heart the axiom in human economy, that the most ill-educated members of any profession or calling, are always those obliged to work hardest and longest. Gardening, as a calling, is often said to be overcrowded, and "J. C. C." is evidently one of those who believe this, since he asks, "What is to become of them all?" (*i.e.*, the young gardeners). Well, I can tell him. The best men, as a rule, will get the best places, and the worst men will naturally get the poorest places! Now it is pretty widely agreed to-day, that no calling is over-stocked with good men, but that most callings are over-stocked with men who take no intelligent interest in their work. I feel sure that it is so in the case of gardening generally. It is not enough to study as "apprentices in really good establishments," but study must go just as one's food and clothing is obtained, *viz.*, as a continual necessity. Even a man who studied Cucumber or Tomato culture so thoroughly as to grow them better and cheaper than his fellows, would soon reap the harvest of his ability, just as has done the foreman who now directs his labours. My argument is, that gardeners should read and study, not only to enlighten themselves as to the world of nature and art around them, and so make their lot, however hard, happier than it would otherwise be, but especially to make themselves better and more valuable to their employers. The more a man reads, other things being equal, the quicker and clearer he can think; and the better he can think, the easier and the cheaper he can work. There is no getting over the logic of hard facts; and in the struggle for existence and place amongst gardeners, it is almost always the weakest that go to the wall. And of course it is these who complain the most, although complaining of the inevitable will never help "J. C. C." nor his young friends, nor anybody else. I am afraid to say what I think of "J. C. C.'s" and "W. L.'s" desire that the gardening papers should each and all contain "an article on botany." Why, are they not filled with articles on botanical subjects from one year's end to the other? To me they seem to become more interesting and instructive every week, and always filled with new problems, or with new phases of old ones. My advice to young gardeners is, to read and study all the good books they can get hold of, and so strive to become happier and more useful men. This is not mere talk, but a programme I myself shall follow as long as I live. The discreet purchase of helpful books can never prove a pecuniary loss to a gardener with intelligence enough to make the best, or even a fairly good, use of them. When a man starts in business of any kind, it is frequently the capital he puts into that business which enables him to get a good living out of it. This is equally true of a gardener who, by some little personal self-denial finds the little capital with which to buy helpful books. He is simply investing his capital in the business of his life, and nothing pays better in the long run than does expen-

diture of this kind on a man's own genius or special calling. When that noble old gardener and Curator of Kew, John Smith I., came to London from Scotland, he possessed only two books on gardening, but, as he himself told me, those two books enabled him to place himself head and shoulders above all the young gardeners then employed at Kew. I do not altogether believe the old story, "Tis not in mortals to command success," but I do believe that we may at least not only do our best to deserve success, but actually win success by our own endeavour; and even the men who slave in London market gardens from 6 A.M. to 8 P.M., might at least spare a few pence each week for books, or adopt other simple means of self-education so as to be worthy of a more congenial occupation. After all, what is the work in any market-garden, however hard, compared with that of a Staffordshire iron-puddler, a potter, a collier, or of a Sheffield grinder? or, think of the dangers and trials of "those who go down to the sea in ships!" I think if "J. C. C." would send me a list of gardeners who have not done well in this world, I might return him that list as containing a list of men who did not read good books, did not adopt any of the advantages of self-improvement now within the reach of all; of men who are miserable because they grumble and whine about the "badness of the times," and have always been hanging around the nurseries pestering people to help them, simply because they have not the energy to shift for themselves. *F. W. Burbidge, M.A., F.L.S.*

LILIAM WALLICHIANUM SUPERBUM.—Mr. Baker, in his description of *Lilium Wallichianum superbum*, in *Gardeners' Chronicle*, p. 480, seems in doubt if it should not be regarded as a species, and I venture to think it is a doubt well founded, for it has little in common with the well-known *L. Wallichianum*. Further on, he says that *L. nepalense*, Don., and *L. ochroleucum*, Wallich, are two names for one and the same plant. Will Mr. Baker say if Wallich's drawing of "ochroleucum," to which he refers, resembles in any way the flower of the true "nepalense?" Mr. Elwes, in his magnificent *Monograph of Lilies*, gives, under the name of *L. nepalense*, an illustration admittedly drawn by Fitch from Wallich's dried specimen of *L. ochroleucum*, and, without doubt, the drawing bears a much greater resemblance to the Lily described by Mr. Baker as "*Lilium Wallichianum superbum*" than it does to the real "nepalense." Wallich described his ochroleucum as "dull yellow," which admirably fits in with the colour of Mr. Baker's *Lilium Wallichianum superbum*; but it would require the wildest stretch of imagination to reconcile such a description with the flower of *L. nepalense*. Indeed, it is difficult to believe that such a man as Dr. Wallich described the flower of *Lilium nepalense* as 5 inches long, and of a dull yellow colour; or that he gave it a descriptive name, totally inapplicable to it. *J. M.*

FIGS.—Amongst the evidences of a considerable development in fruit culture, which hardly finds encouragement in connection with popular fruit-growing agitations, is the large demand now growing up for good Figs, which it is difficult to meet. Whether due to the more-refined taste which now exists in relation to fruit products, or due to the increased wealth of the country, certain it is that Fig growing is developing rapidly, both in private gardens and in market establishments. Amongst those trading firms who are enabled to feel the pulse of Fig culture, as it were, few, perhaps, are better placed than Messrs. Jas. Veitch & Sons, Chelsea, for they produce many hundreds of fine fruiting plants of a score or more of varieties, in pots, yearly, and find themselves now quite cleared out at the end of the season; whilst but a few years ago, the sales of such plants hardly exceeded dozens. The advantage of pot culture is found in having numerous varieties, the plants well under control, kept somewhat root bound, fruiting more freely than when planted out, facility for removal to diverse houses or temperatures, and securing of all the crops the plants produce. Amongst newer varieties, the Negro Largo, so free to bear and highly flavoured, is in great demand; whilst a yet newer form, *Violette Sepor*, very stout in growth, short jointed, and an exceedingly free cropper, is a valuable addition to the varieties—the fruits are of rich flavour and very luscious. A comparatively flattish round and distinctively high-flavoured form of the Brown Turkey promises to prove a capital addition also. It is worthy of notice that Figs, like Tomatos in an uncooked state, are not to every one's taste at first, but once they are liked, then they never tire. There are few

more wholesome or healthful, and, in a restricted sense, better medicinal fruits, than ripe figs. *A. D.*

WHAT IS A HARDY HERBACEOUS PLANT?—The difficulty of defining this term has been before me for many years, and when I have been selected to judge at provincial flower shows, and have asked for instructions as to limitations, have generally been told "not to be particular." In fact, I see no way out of the difficulty, except to exclude from the term "herbaceous" all monocotyledonous plants; otherwise, we must draw a line in the middle of a species, such as "Iris," and if you try to exclude "bulbs and corms," where do "tubers" begin? In terrestrial Orchids, would *O. foliosa* come under bulbs, and *Cypripedium spectabile* under "Hardy Herbaceous?" And what shall we do with *Trillium*, *Alstroemeria*, *Anthericum*, and such-like? The limitation I have proposed would not do away with the difficulty of drawing a line between "herbs" and "shrubs" in their botanical definition, as many a genus must be split in two—*Veronica*, for example. If it is decided to leave the matter to the judges, the chief objection would be, that some exhibitors are more scrupulous or more cautious than others in their acceptance of the limits of the class in which they exhibit. *C. Wolley Dod, Edge Hall, Malpas.*

THE NAME "JERUSALEM ARTICHOKE."—Mr. Dixon, on p. 482 of the *Gardeners' Chronicle*, writes a long dissertation on the Jerusalem Artichoke. He tells us that Jerusalem is, in this name, corrupted from *Girasole*, which is Brazilian (Portuguese?) for Sunflower, and that the plant being "a native of either Peru or of a district in Brazil" (though, as he afterwards tells us, it was introduced into Europe from Canada), brought its Brazilian name with it to Europe. In the first place, this statement revives an error which botanists have long since corrected, as to the native country of the Jerusalem Artichoke. No species of Sunflower, as far as is known, is a native of Brazil, and though two or three are found in Peru, they are all of fruticose habit, and not all likely to be the parent of the Jerusalem Artichoke (see De Caudolle, *Prodromus*, vol. v., p. 590). It is true that students of American botany have been a little puzzled about the origin of this plant. Asa Gray formerly referred it to *Helianthus doricoides*, but in his *Flora of North America* he made it a separate species, though he tells us that *H. giganteus* also produces edible tubers, called Potatos, in Canada. It seems probable that more than one species of Sunflower produced edible roots, when cultivated by the natives of North America, perhaps before they had intercourse with Europe. Then Mr. Dixon, having drawn what he considers an infallible conclusion from a false premise, proceeds to speak disparagingly of those who dare to differ with him, naming me. He does not, however, attempt to answer the question I formerly put, the substance of which I ask leave to repeat here. Granted that the reasoning seems plausible which contends that Jerusalem, as prefixed to Artichoke, is a corruption of the Italian *Girasole*, how is it to be explained in the following combinations:—Jerusalem Cowslip (*Polmonaria*), Jerusalem Sage (*Phlomis*), Jerusalem Thorn (*Parkinsonia*), Jerusalem Cross (*Lycnius chalcidonica*), Jerusalem Oak (a species of *Teucrium*), Jerusalem Star (a *Cerastium*), and Jerusalem Gourd? Perhaps this list of Jerusalem names might be lengthened. My contention was that our ancestors were in the habit—perhaps from the days of the Crusades, of referring the origin of strange plants to Palestine, and so Jerusalem came into the name. I have given eight names, and of one of them a somewhat far-fetched and pedantic derivation is invented, but no explanation is offered of the other seven. Is it unlikely that the name was given to all in the same trivial and casual way, and signifies nothing more than the ignorance of the namer? *C. Wolley Dod, Edge Hall, Malpas.*

THE DAY LILY OF THE DESERT (HESPEROCALLIS UNDULATA).—I wonder how many English or Continental lovers of flowers have seen this early summer-flowering novelty, described as "one of the most beautiful and characteristic plants of the desert regions of California." One traveller reports having counted no fewer than thirty flowers on one stalk, of a pearly-white, with delicate greenish stripes. It is also fragrant—in addition to which must be mentioned the fact that the bulb is edible—having a pleasant taste, and may be eaten raw, or cooked like Onions. The Indians are said to look upon it as a veritable treasure, not only refreshing the eye with

its wondrous beauty, but proving of valuable utility as well, the same plant producing both "food" and "drink." The bulb grows as large as an Onion in clear sand, 6 or 8 inches below the surface; some have been found resting on a bed of moist gravel. One Californian editor speaks of it as being "one of the handsomest flowers found in April." As I see bulbs were procurable in California in the autumn of 1889 at a very reasonable rate per 100, surely our bulb growers can by this time manage to procure it? *Pioneer.*

SEEDLING CHRYSANTHEMUMS.—It is not difficult to make an annual of the *Chrysanthemum* in regard to its time of blooming, when raised from seed. I saw at the Rye Croft Nursery, Lewisham, recently, a batch of seedling *Chrysanthemums* raised from seed sown on the 25th of March last. Mr. H. J. Jones said that a portion of the seed came from America, and a portion he saved on his own nursery. A plant of a Japanese variety showed signs of seedling, and it ripened sufficiently to gather by February. Mr. Jones said that when he rubbed it out of the seed pods, it looked as if not a plump seed had been produced; but he sowed it on bottom heat on the date above mentioned, and some plants put in an appearance. These were pricked off, and grown on into size gently until they were placed into their blooming pots. As soon as they were established, the tops were pinched out, with the result that they soon broke into three and four shoots each; and, all being well advanced in bud, were housed early in October. There is promise that all of them will bloom, and that shortly. The plants are now under glass, and some, among them a promising yellow, are showing colour. Mr. Jones stated that he assisted the ripening of the seed by standing the pot, in which the plant maturing its seed was, upon a hot-water pipe. It is, therefore, apparent that the seed of the *Chrysanthemum* can be sown, and the seedlings got into bloom, in the space of eight or nine months. *E. D.*

RASPBERRY SUPERLATIVE AND CARTER'S SEMPER FIDELIS.—The superiority of *Superlative* in every way over *Hornet*, *Fastolf*, and others, was affirmed by Mr. J. Sheppard in these pages early in the year. *Superlative* is not quite so early as those, but it has the advantage of being much larger and more productive; and it being a strong grower, it requires more room and but few stakes for support. I planted fifty canes of *Superlative* two years ago, and it gave so much satisfaction, that I planted more of it the following season. I may remark that from three rows of *Superlative* we have had more fruit than from twice the number of rows of other well known varieties, so that I intend to grow it still more largely in the future. At one of the meetings of the Royal Horticultural Society, this fruit was shown by Messrs. Veitch, and was far ahead of any others. For preserving it is much liked; and the fruit is less liable to decay than others, as owing to the robustness of its growth, the fruits are well elevated above the foliage. Another recommendation that this variety possesses is the length of time that it continues to fruit, which is longer than that of any other variety I know of, and even the smallest growths fruit after larger canes have ceased to bear. Being a strong grower, spring and autumn dressings of manure are necessary. The *Raspberry Semper fidelis*, is chiefly to be valued for its goodness as a variety for preserving, as it makes a jam distinct in flavour from all others; and is much liked by those who prefer more acidity than is found in other Raspberries. The colour of the preserved fruit is excellent, and the fruit is valued on that account. *Semper fidelis* is a free-growing variety, late, very prolific, and not much liked by the birds. It is a much smaller fruit than *Superlative*, and is fit only for preserving or cooking. *Geo. Wythes, Syon House.*

DEVONSHIRE FERNS.—Mr. Drury's criticism at p. 420 is interesting, and I am glad that my discrepancies in writing on Devonshire Ferns have drawn out from so great an enthusiast such a long discourse. My paper, however, was not written in a comprehensive spirit, neither does it require that "discriminating eye" spoken of to perceive this, as it is quite easy to do so in the ordinary way. I have now dipped a little deeper into the subject, and note that there were yet other varieties or species of wild Ferns in Devon apparently unknown to Mr. Drury, since he has omitted to mention them, and I have also discovered that the *Lomaria spicata* was popularly known as the rough Spleenwort even before the days of that quaint old writer, Gerard—so far

so good; and now we come to the question of manipulation in reference to varieties. My contention is, that when a wild Fern having some variation from the species to which it belongs, is removed from its natural habitat to a garden, where, after a lapse of time it is proved that the said variation has developed, or, it may be, remained constant, then it may be regarded as a variety of that species, and this is precisely where the manipulation I spoke of comes in. When I was a nursery traveller, I was in touch with many rich collections of British Ferns in different parts of the country, and long ago was convinced that there were distinctions with little differences in many of the so-called varieties, therefore, we can well afford to sweep off a great number of them, and their tedious ugly names with them; in fact, to put the whole thing in a nutshell, there are said to be nineteen genera of British Ferns, subdivided into forty-five species, which, according to Mr. Drury, comprise some 1800 forms or varieties. Now, my candid opinion is, that if all these could be brought together at a Fern Congress, quite four-fifths would, if the work were done rigorously, be cast aside, as being insufficiently distinct. Then, the varieties that remained were re-named with short English names, after the manner of florists' flowers, as, for example, *Nephrodium filix-mas*, Adam; *Asplenium filix-femina*, Eve; *Aspidium aculeatum*, Eclipse; *Scolopendrium vulgare*, Unique;—there would be more hope of finding a named collection of British Ferns in well-appointed gardens throughout the land. *W. Napper, Chelsea.*

NEPHROLEPIS PECTINATA.—On the back wall of a north house in Messrs. Thomson's nurseries, Sparkhill, Birmingham, a plant of this creeping form, in a rustic stand, was placed a year or two since, and it now occupies a considerable portion of the wall, so freely has it thrown out and extended its growth. It has a most pleasing appearance, and I recommend it for such a purpose. The house in which it is thriving so well is devoted to Ferns and young Palms. *W. D.*

ROSES MADE OF BUTTER.—Most people would probably imagine butter to be rather an unsuitable material—especially in warm weather—for making floral designs. At the Dairy Show, recently held at the Royal Agricultural Hall, an enterprising exhibitor (whose name unfortunately I do not remember), however, was apparently of a contrary opinion. At any rate, by some means or another he contrived to make a display of Roses, which at a distance of a foot or two looked almost natural. It had never before struck me so forcibly that *Maréchal Niel* Roses were of the colour of certain kinds of butter, but I am afraid the æsthetic ear (if I might use such a term) would be highly offended at hearing anyone describe the flowers of this fine Rose as being "butter-coloured." Golden-yellow sounds ever so much nicer. What rendered these butter *Maréchal Niels* so effective was the use of natural Rose stems and foliage, on to which the unctuous blooms and buds were artfully stuck by means of pieces of thin wire. The shape of the flowers and the delicacy of the petals were all that could be desired from a florist's point of view. *Mitza.*

BIGNONIA RADICANS.—It is very seldom now that one sees the old *Bignonia radicans*, and yet when planted in a suitable position, it is one of the finest hardy climbers we have; at least, it is hardy in most places, although I have known it killed down in severe winters, but even then it generally breaks up again from the crown, and quickly covers a large space of wall, and clothes it with beauty. To see it at its best, it must have a southern aspect, and not be planted in rich soil, a deep sandy loam being the most suitable, as then its growth is not too strong, and the shoots are easily ripened. The way to treat the plant is to run up and train out the branches in a fan-shaped manner, or in such a way as to cover the wall space, and leave them a foot or so apart, and each winter to spur back close the whole of the shoots made during the summer, as it is on the young ones made each year that the flowers are borne; these come in dense clusters at the ends, and each flower forms a tube 3 inches or so long, with distended mouth, the colour being a rich deep chestnut-brown when the blooms are open. Our plant is on the end of a shed and greenhouse, and covers a space of about 150 square feet; but if it had scope, it would quickly double that, as it is very free-growing. Just now, almost every shoot, and there are a great many, is terminated by great clusters of flowers, and therefore the effect produced is striking and fine. *J. Sheppard.*

CEREUS J. T. PEACOCK.—From the specific name it will be easy to infer the origin of this plant, as it was widely known that the late J. T. Peacock, of Hammersmith, was a great connoisseur and collector of this class of plants, and we believe it was imported direct by that gentleman. To those unacquainted with the plant, it is by no means a gigantic or unmanageable thing; on the contrary, it is very similar in growth and flower to the flat-stemmed, leaf-like section, called

FIG. 71.—*PAPAVER GLAUCUM*: TO SHOW HAIRY FLOWERS, BRILLIANT SCARLET.

Phyllocactus, but with the very great difference that it far surpasses in gorgeousness, both in size and colour, any known member of that genus. It is a matter of common knowledge that in the flowers of many Cacti there is very little difference in the texture between the sepals and petals, there being no sharply-defined difference between them, but occasionally there is a difference in the colour. In J. T. Peacock the sepals or outer whorl of the flower are brilliant scarlet, the petals or inner series are

FIG. 72.—*PAPAVER GLAUCUM*.

somewhat broader, and a rich vivid purple and scarlet, which, with the yellow tassell-like bunch of stamens in the centre gives this flower a gorgeous appearance. Fortunately, like most other Cactuses, it is easy to accommodate, 5 or 6-inch pots are sufficient to grow good-sized specimens planted in the usual light loamy compost, taking care not to over-water them, but during the summer, as they delight in abundance of sun and air, there will not be much danger of their coming to grief. It is during the

dull days of winter, when the plants are dormant that care must be exercised in watering. Almost every part of the plant roots readily as cuttings. This plant, as well as all the *Phyllocactus* section, will succeed in all temperatures if not below freezing. They can withstand long periods of drought without injury, and should be fully exposed to the sun. In this respect we have seen, on closely-allied plants, the sun's rays fall so direct and concentrated as to melt large pieces of indiarubber hose, yet it did not seem to injure the plants. Shade and damp soon weakens them. *F. R.*

NOVELTIES.

PAPAVER GLAUCUM.—Messrs. Ernst Benary, of Erfurt, announce as a novelty, a scarlet-flowered Poppy, *P. glaucum*, and for the illustrations of which we are indebted to the famous firm at Erfurt. The plant, as described in Boissier's *Flora Orientalis*, i., p. 116 (1867), is glaucous, with only a few appressed hairs on the flower-stalk, with pinnately-lobed leaves and deep scarlet flowers. The plant is a native of Northern Syria, where it flowers in early spring. We have not seen the flowers, but the venation of the petals appears different from what we should expect to see in a Poppy (see figs. 71, 72).

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, October 27, 1891.—The meeting of the above society took place at the Drill Hall, James Street, Westminster. The principal feature of the exhibition was the collection of coloured leaves, such as the diminishing light and lower temperature of autumn bring about. It is hardly possible to conceive a more beautiful or interesting "exhibit" than was made on this occasion. But the British public either did not think so, or did not know of the exhibition. Be this as it may, an interesting display of Orchids, a remarkable show of fruit, and a sprinkling of good Chrysanthemums—foretaste of what is to come—made up a "meeting" which was certainly not the least interesting of the season. Adverting first of all to the autumn leaves, we have to note the collection exhibited by Mr. E. C. Smith, of Cobham, and to which a silver medal was awarded. Though not numerically so large as some other collections, this was the most appropriately arranged and the most effective, so far as beauty is concerned. American Oaks and yellow Horse Chestnuts were especially conspicuous; while as a margin to the whole, the exhibitor had the eminently happy thought of placing a wide belt of green moss, thickly studded with a scarlet fungi such as *Amanita muscaria*, *Agarius rachodes*, *A. rubescens*, *Cantharellus cibarius*, and others which were delightfully appropriate and effective.

Next in order on the left, proceeding up the hall from the entrance, was a large collection from Syon, comprising no fewer than forty-one varieties of Oak. This was instructive, not only for the number and interest of the specimens, but from the example it afforded of the pernicious effect of a London atmosphere on the coloration, for though consisting mainly of the same species as shown in other collections, the color of the specimens from Brentford was dull and ineffective.

The collection from Weston Birt, Gloucestershire, was very rich both in species and in colour. We can only note a few of the more remarkable illustrations, *Cornus sibirica*, with its red rich twigs; *Acer rupestris*, *A. septemlobum*, American Oaks, particularly *O. Catesbeii*, a small-leaved species, but specially rich in colour; *Enonymus alatus*, *Pyrus arbutifolia*, &c.

The collection from Combe Wood was naturally full of interest, the more so on this occasion as it was reinforced by contributions from Mr. Antony Waterer of Woking. *Andromeda arborea*, *Acer palmatum*, *A. platanoides*, *Liquidambar*, *Rhus glabra*, *Cerasus Watereri*, *Pyrus arbutifolia*, *Berberis Thuu-bergii*, *Ribes missouriense*, very deep claret red; *Azalea occidentalis*, *Syringa pekinensis* were among the most striking of this collection.

Messrs. Cutbush sent a good miscellaneous group, less well coloured than some others. The same exhibitors showed a nice collection of *Pernettya*, with berries of different colours.

Mr. H. Veitch's lecture was chiefly devoted to the enumeration of the most desirable species to plant for the sake of the autumn coloration. With the splendid resources at hand, he had no difficulty in enforcing his remarks practically. To report his lecture would be to give some pages of a dictionary, for the alphabetical order was adhered to, but as the lecture was delivered, and the specimens in illustration, it is quite appropriate to describe it as a brilliant discourse. In the discussion which followed, Mr. Bunyard took part, emphasising the necessity for isolating the plants, so as to get their full beauty; while Mr. William Paul pointed out the superior advantage some specimens had over others in the matter of their longer duration. Mr. Paul considered that the nature of the soil had much to do with the rich coloration of particular species.

Chrysanthemum occupied a good deal of space, and amongst them were several sterling novelties of English raising, besides sports of well-known varieties. Orchids were present in some quantity, considering the late period of the year, and much hardy fruit and some Grapes were shown.

Floral Committee.

Present: G. Paul, Esq., in the chair; and Messrs. B. Wynne, H. Herbst, R. Dean, G. Bryceson, H. B. May, G. Phippen, C. Jeffries, W. E. Poë, C. E. Pearson, F. Ross, G. Gordon, H. Cannell, W. Furze, C. Noble, and J. Walker.

Some well-berried *Pernettya elegans* in variety came from Messrs. W. Cutbush & Son, Highgate Hill, one of the best being *P. macrocarpa*, with berries of a bright crimson hue. The bright-flowered *Clerodendron fallax* in small examples came likewise from the same firm. It has especial value at this season.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a pretty white-flowered *Bouvardia*, *Jasminiflora alba odorata*. The reverse of the floral segment is pink, the tint appearing to slightly suffuse the white.

A compact and dwarfer form than the common *Richardia* (*Calla*) *athiopica*, was shown by Messrs. R. Veitch & Son, Exeter.

Messrs. B. S. Williams & Son, Victoria Nurseries, Upper Holloway, N., showed a plant of *Arisaema Wrayi*, of the height of 2½ feet, palmate leaves of a green colour, stem and leaf stalks green with dense fawn-coloured marblings. The spathe pale-green in all parts except the interior of the hooded portion, which is deeper in tint. The spadix is terete, purple and semi-pendant.

We are so near the Chrysanthemum shows, that it is not to be wondered at if Chrysanthemum were a leading feature at the Drill Hall on Tuesday last. Messrs. Veitch & Sons, nurserymen, Chelsea, had a bold and striking group of plants, generally well bloomed, of leading varieties of Japanese varieties, as *Viviana Morel*, *Miss M. A. Haggas*, *Robert Cannell*, *Louis Behmer*, and *Alberic Linden*.

Mr. T. S. Ware, Hale Farm Nurseries, had three blooms of *Viviana Morel*, but paler than those shown by Messrs. Veitch & Sons; *Amos Perry*, a large golden-yellow incurved Japanese; and *La Comdaine*, in the way of *Marsa*, delicate pink; two blooms of this were shown, but not fully developed. Mr. George Wythes, gr., Syon House, Brentford, set up a stand of blooms of leading varieties of Japanese and incurved Chrysanthemum, cut with long stems and supported by means of wire; there were about 120 blossoms, backed by *Falrus* and margined with small Ferns. It was an effective exhibit, but it is doubtful if the idea can be extended generally to Chrysanthemum exhibitions.

From Messrs. J. R. Pearson & Sons, Chilwell Nursery, Nottingham, came three fine blooms of the new incurved Chrysanthemum *M. R. Bahaunt*, one of the Queen type, very large and full, grandly incurved, the colour pale rosy-cerise, with silvery-salmon reverse (Award of Merit).

Mr. Robert Owen, Floral Nursery, Maidenhead, had a large number of Chrysanthemum, large flowering and Pompon; including *Achievement*, white, with slight yellow centre, a seedling from *Madame Desgranges*, and an October-flowering form of *M. R. Bahaunt*, *Madame Darrier*, a new Continental incurved, the flower of the type of *Venus*, but with the colour of *Cherub*, which the Committee wished to see again, when more fully developed; *Cardinal Foulon*, bright claret-crimson shaded—an attractive-looking reflexed flower; *Felix Cassagneau*, fine deep golden apricot—attractive in colour, shape of flower of *Avalanche*; two very fine blooms of *W. Tricker*, one of the new American varieties, delicate rose, a large and full

incurved Japanese, and with it one bloom of *Nineveh*, an older variety, and said to be identical with *W. Tricker*, and the original of it; *Felix Mourant*, pale orange-crimson, in the way of *M. W. Holmes*; *Permanent*, Japanese, incurved, which opens delicate pink and becomes blush; *Confidence*, bright pink, broad petalled, reflexed; *Mrs. Nisbet*, shaded claret crimson, very fine in colour, broad petalled (Award of Merit); *G. C. Schwabe*, golden yellow, tipped with reddish dark-brown; and several hybrid Pompon and pompon varieties as *Lady Emily Fitzmaurice*, yellow, very free; *Profusion*, golden-yellow, very free; *Golden Shower*, pale-gold, very bright; and several others.

Mr. W. Wells, Nurseryman, Earlswood, had *William Wells*, a very fine and distinct primrose, sport from *Middle Blanche Pigny* (Award of Merit).

Messrs. Pitcher & Manda, Nurserymen, Sydenham, had *Henry Ballantine*, a deep golden-yellow Japanese, but rather flat, which the Committee wished to see again: *Louis Behmer* and *Mrs. Flann*, a pale coloured Anemone variety. From an exhibitor whose name did not transpire, came *Robert Smith*, a pale bright chestnut red sport from *Dr. Sharpe*, not showing so much of the quilled petal as the variety from which it sprang—larger and fuller (Award of Merit).

From Mr. W. Mitford, gardener to *W. Kaye, Esq.*, Worcester Park, Surrey, came an unnamed orange, brown and buff sport from the yellow anemone *George Sand*, which is of a promising character.

From Mr. H. J. Jones, Ryecroft Nursery, Lewisham, came a plant of *Louis Behmer*, carrying superb blooms, bright pale lilac, with a silvery blush reverse, very fine, the hairy petals being well developed (Award of Merit); one of *C. E. Shea*, a yellow sport from *Madlle. La Croix*, and a plant of *Felix Cassagneau*, described above. Mr. R. Falconer Jameson, Hessel Hall, had blooms of *M. R. Bahaunt*, *Bouquet de Dame*, pure white; and *Marvel*, white with slight purple stripes.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, J. Douglas, E. Hill, Hugh Low, H. M. Pollett, Maxwell T. Masters, L. Castle, T. B. Haywood, F. Sander, D. B. Crawshaw, and Sydney Courtauld.

Messrs. F. Sander & Co., St. Albans, exhibited a group of Orchids consisting of six varieties of *Odonoglossum grande*; and plants of *Vanda cœrulea*, *Aërides Lawrenceana*, *Oncidium incurvatum album*, *Peristeria guttata*; a fine form of *Lycaste Skinnerii alba*; *Cattleya Bowringiana*, one having six and the other five spikes; *Lissochilus Krebsii*, *Cypripedium Maynardii superbum* (previously Certificated), *Dendrobium O'Brienianum*, an extraordinarily graceful species with long pendent sprays of greenish flowers, to which a Botanical Certificate was awarded, and various other Orchids. They, moreover, staged some fine masses of the true autumn-flowering *Labiata*, some of them with 100 bulbs, and all in grand condition, as examples of what suitable packing and quick transit are able to do. Messrs. Collins & Collins, of the Cumberland Park Nurseries, Willesden Junction, exhibited a very creditable and showy group made up of many varieties of *Oncidium varicosum*, *O. prætectum*, *O. Forbesii*, *O. curtum*, and *O. tigrinum*. The group displayed excellence in the varieties and much cultural skill. Mr. H. A. Tracy, the Orchid Nurseries, Amyand Park Road, Twickenham, showed a specimen of *Aërides suavisimum*, and a supposed hybrid *Cypripedium*, showing similarity to *C. Hookerii* × *C. Lowianum*. *E. G. Wrigley, Esq.*, Victoria House, Dunkinfield, Cheshire, sent flowers of a *Dendrobium* greatly resembling *D. litiflorum*, but which is said to differ in growth; indications of growth was requested. Also a flower of *Pleione*, of which the committee desired to see a bulb before naming.

Admiral Caton, Hazelwood, King's Langley, exhibited a group of *Dendrobium formosum giganteum*, the largest specimen having over thirty flowers; a vote of thanks. *F. Wigan, Esq.*, Clare Lawn, East Sheen, Richmond, staged a fine plant of *Cattleya Warocqueana* with six flowers, and a very remarkable broad-petalled form of *Cypripedium insigne* of the *C. I. Maulei* group. Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, sent a grand variety of *Cypripedium* named *C. Pitcherianum superbum* (*Spicerianum* × *Harrisianum superbum*), the variety was superior to the type. Messrs. Pitcher & Manda, United States Nurseries, Hextable, Kent, again sent their form of the beautiful *Cypripedium Arthurianum*, whose dorsal

sepal is dotted with purple as in *C. insigne Maulei*. *E. J. Lucas, Esq.*, Warham Court, Horsham (gr. Mr. G. Duncan) staged a pan of several plants of a form of *Angraecum bilobum* from Dutch New Guinea; also cut flowers of *Oncidium crispum*, *Laelia anceps Dawsonii*, and *Cattleya labiata vera*. *E. H. Woodall, Esq.*, St. Nicholas House, Scarborough, forwarded a portion of a magnificent spike of a very fine form of *Vanda Kimballiana*. *Chas. Ingram, Esq.*, Elstead House, Godalming, sent some plants of *Cattleya Warocqueana* bearing together over thirty blooms, a plant of *C. calummata* ×, and the beautiful *C. radium* × (*Lawrenceanum* × *Spicerianum*), to which an award of merit was accorded.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. G. Woodward, T. F. Rivers, R. Hogg, G. Bunyard, W. Wilks, H. D. Blackmore, C. Ross, W. Warren, J. Willard, A. Dean, A. Pearson, G. Reynolds, W. Bates, George Wythes, James Hudson, H. Balderson, F. Q. Lane, J. Smith, W. Denning, and J. Cheal.

Large collections of Apples and Pears formed the chief subjects for the committee to deal with; of smaller items a First-class Certificate was awarded to Mr. Reynolds, Gunnersbury Park Gardens, for white Grape Chasselas Napoleon, a French variety reputed an indifferent setter in France, but here vouched for by Mr. Reynolds as a capital setter and a free cropper. The bunches are of good size, tapering, and handsome, the berries large, semi-oval, and of very fair quality.

Mr. C. Ross, Newbury, showed a fine and handsome seedling Pear, but it was found to be somewhat gritty, and lacked flavour. Mr. Ross also showed spikes of fruit of *Phytolacca decandra*, about 12 to 14 inches long, and tapering. The berries covering the spikes resembling Blackberries, but were rather acid. This fruit grows luxuriantly in not too dense woods, and is strongly recommended as food for pheasants. Mr. King, gardener to P. Crowley, Esq., Croydon, was awarded a Cultural Commendation for a dish of very fine and handsome fruits of *Cox's Orange Pippin*, which the committee found to be finely flavoured, and showed how deficient in quality were some Apples sent for approval.

Mr. Chambers, Abingdon, sent a dish of a very handsome seedling Apple, which however did not meet with approval. The same must be said of a Seedling apple from Mr. Dyke, Southwell, as also one from Mr. Smith of Newark.

Mr. W. Taylor, Hampton, showed fruits of Apple *Jolly Beggar*. Mr. Debnam, gr. to A. Pears, Esq., Isleworth, showed a scarlet-flesh Melon, product of a cross between *Hero of Lockinge* and *scarlet Premier*, but it was much too late in the season for it to exhibit its best qualities. Also a dish of very fine fruits of *Tomato perfection*, to which a Cultural Commendation was awarded, came from Mr. Pears.

Of larger exhibits, by far the finest from gardeners was the splendid collection of some 115 dishes of Apples and Pears shown by Mr. Woodward, Barham Court Gardens, Maidstone. This fine lot included Pears, superb examples of *Gansell's Bergamot*, *Duchess d'Angoulême*, *Burré Hardy*, *Doyenné du Comice*, *Pitmaston Duchess*, *Easter Beurré*, *Nouveau Poiteau*, *Doyenné d'Alençon*, *Marie Benoist*, *Fondante Merriott*, *Ne plus Meuris*, and *Glou Morceau*. Of Apples very fine indeed were *Lady Heniker*, *Yorkshire Beauty*, *Lord Derby*, *Gascoigne's Seedling*, *Washington*, *Belle Dubois*, *Mère de Menage*, *Warner's King*, *Queen Caroline*, *Tyler's Kernel*, *Golden Noble*, *The Queen*, *New Hawthorn-den*, *Anne Elizabeth*, and *Northern Spy*, the latter unusually fine; also of dessert fruits, *Melon Apple*, *Claygate Pearmain*, *Cox's Orange Pippin*, *Reinette de Granville*, *Adam's Pearmain*, *Mother Apple*, *Wealthy*, and the beautifully coloured *Calville Rouge Précoce*.

Mr. G. Wythes, Syon House Gardens, showed some eighty dishes of Apples and Pears, many, however, being indifferent samples. The best Apples were *Golden Spire*, *Warner's King*, *Blenheim Pippin*, *Alfriston*, *New Hawthorn-den*, *Ribston Cox's Orange*, *King and Holland Pippins*, *Worcester Pearmain*, &c. Of Pears the best sorts were *Pitmaston Duchess*, *Marchal de la Cour*, *Uvedale's St. Germain*, *Reliance d'Hiver*, *Madame Denalke*, *Duchesse d'Angoulême* and *Beurré Diel*.

Mr. Markby, Wimbledon, had eight dishes of very fine Apples of trade collections. One of special excellence, the Apples generally being singularly fine, was that of 100 dishes of Apples and Pears staged by Messrs. J. Veitch & Sons, who had baskets of Alexander,

Bismarck, New Hawthornden, Peasgood's Nonsuch, Sandringham, Gloria Mundi, &c. Also of choice dessert varieties, Golden Brunette, Brownless Russet, Sturmer Pippin, Barnack Beauty, Rosemary Russet, Ribston Pippin, King of the Pippins, Cox's Orange Pippin. Of Pears excellent were Princess, Dayenné Boussoch, Duchesse d'Angoulême, Louise Bonne, Fondante de Cuerne, Beurré Baltet Père, Beurré Bachelier, and others.

Messrs. Paul & Sons, Chesbunt, had nearly 100 dishes of Apples and numerous varieties of Pears. The best of the former were Bedfordshire Foundling, Blenheim Pippin, Cox's Pomona, Warner's King, Beauty of Kent, Ecklinville Seedling, Cibston Pippin, Schoolmaster, Winter Queening, Golden Noble, Transparent de Croucelles. The Pears were very good samples.

Messrs. J. Peed & Sons, Norwood, had some fifty dishes of Apples, the best of which were Gold Medal, Glory of the West, Peasgood's Nonsuch, Stirling Castle, Beauty of Kent, Belle Pontoise, Sturmer Pippin, and Hoary Morning.

Mr. Barron sent up from the Society's Garden, Chiswick, sixty dishes of Apples all of fine appearance, including Anne Elizabeth, Bramley's Seedling, Grenadier, Alfriston, Cellini, Small's Admirable, Gascoigne's Seedling, New Hawthornden, Blenheim Pippin, Mrs. Barron—very fine, and Swedish Reinette. Also of Pears already for table, some twenty-four dishes, Maréchal Dillon, Maréchal Vaillant, Urbaniste, A. J. Moltke, Vireus, Flemish Beauty, &c.

Fruits in competition.—A few classes for fruits in competition for prizes were instituted at these meetings. Those for Grapes, six bunches for flavour, and six bunches any varieties, brought one competitor in each only. Mr. C. Reynolds, whose exhibits were as usual excellent. His varieties for flavour were Black Hamburg, Muscat Hamburg, West St. Peter, Mrs. Pince, Mrs. Pearson, and Muscat of Alexandria. The other six bunches comprised Groa Maroc, Black Hamburg, Muscat of Alexandria, Mrs. Pearson, and Chasselas Napoleon. Mr. Sage, Ham House Gardens, Richmond, was the only exhibitor of ten dishes of Apples, six to be culinary and four dessert. These were all good samples, and comprised Peasgood's Nonsuch, Withington's Fillbasket (query, Warner's King), Alfriston, Lord Grosvenor, Baumann's Red Reinette, King's, Cox's, and Blenheim Pippins, &c. Only two competitors entered in the class for six dishes of Pears, Mr. Hudson, Gunnersbury House Gardens being first with riper samples of Josephine de Malines, Marie Louise, Pitmaston Duchesse, Beurré Superfin, Lonia Bonne, and Beurré Diel. Mr. Sage was second, having good Flemish Beauty, Duchess d'Angoulême, Beurré Bachelier, &c.

List of Awards.

FLORAL COMMITTEE.

Awards of Merit.

- To Mr. R. Owen, for Chrysanthemum Mrs. Nisbet.
- To Messrs. J. R. Pearson & Son, for Chrysanthemum Mons. R. Bahaunt.
- To Mr. R. Owen, for Chrysanthemum Mons. R. Bahaunt.
- To Mr. R. Falconer Jameson, for Chrysanthemum Moos. R. Bahaunt.
- To Mr. W. Wells, for Chrysanthemum William Wells.
- To Messrs. H. Cannell & Sons, for Chrysanthemum R. Smith.
- To Messrs. Pitcher & Manda, for Chrysanthemum Louis Böhmer.
- To Mr. W. Furze, for Chrysanthemum Louis Böhmer.
- To Messrs. J. Veitch & Sons, for Chrysanthemum Louis Böhmer.
- To Cypripedium Williams' variety, shown by Messrs B. S. Williams, Upper Holloway.

Botanical Certificate.

- To Dendrobium O'Brienianum, shown by Messrs. F. Sander, St. Albans.

Award of Merit.

- To Cypripedium radiosum, shown by Mr. C. Ingram, Elstead House, Godalming.

MEDALS.

Silver Flora.

- To Messrs. J. Veitch & Sons, for collection of Cut Autumn Foliage.

Silver Banksian.

- To E. G. Smith, Esq., for collection of Cut Autumn Foliage.
- To R. S. Holford, Esq. (Mr. Quarterman, gr.), for collection of Cut Autumn Foliage.
- To the Duke of Northumberland (G. Wythes, gr.), for collection of Chrysanthemum Blooms.
- To Messrs. J. Veitch & Sons, for a collection of Chrysanthemums.

Bronze Banksian.

- To Messrs. W. Cutbush & Son, for collection of Cut Autumn Foliage.
- To the Duke of Northumberland, for collection of Cut Autumn Foliage.

Small Silver Medal.

- To E. Collios, Cumberland Park, for collection of Orchids.

Bronze Medal.

- To Messrs. H. Sander & Co., St. Albans, for Group of Orchids.

FRUIT COMMITTEE.

First-class Certificate.

- To Messrs. De Rothschild (gr., Mr. C. Reynolds), for Grape Chasselas Napoleon.

MEDALS.

Silver-gilt Banksian.

- To G. Woodward, gr., Barham Court, Maidstone, for 115 dishes of Apples and Pears.
- To Messrs. Veitch & Sons, Chelsea, for 100 dishes of Apples and Pears.

Silver Banksian.

- To Messrs. Paul & Sons, for 100 dishes of Apples and Pears.
- To Mr. G. Wythes, Syon House, for a collection of 110 dishes.

Bronze Banksian.

- To Messrs. Peed & Sons, Norwood Road, for 50 dishes of Apples.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

Fruit Conference.

SECOND DAY, October 22.—The second day's proceedings of the Conference were not a whit less interesting than the first. The Mayor introduced Sir James Whitehead, Master of the Fruiterers' Company, to take the chair.

The great drawback which Sir James emphasised was the want of compensation and the insecurity of tenure to the fruit-grower. This would interfere with tenants going into the work with a will, and it was useless to persevere until it was corrected. The preparation of the soil in the shape of draining, and digging and manuring, the cost of the trees, and the expenditure for the first five years, reached up to such a sum, that it was only the capitalist who could face it; hence the stumbling block of insecurity of tenure, and inadequate compensation must be met by the landlords of the county full in the face.

The Chairman then called upon Mr. Luckhurst, Ranford, who read a paper on "The Importance of Early Planting and Shelter in Fruit Culture." Shelter he looked upon as one of the main supports for keeping fruit on the trees. Many thousand bushels were lost for want of it. Many orchards were planted without regard to shelter at all, and high winds lessened the crop, which was generally cut down to a low state by spring frosts and other influences. If all growers of orchard trees would plant a belting around them, they would soon find out its value. He recommended the planting of a double row of Lombardy Poplars where ground was limited. Where space was not so much of an object here, the best thing of all was to plant Austrian Pine. This tree was about the most serviceable as a block line that could be used. Early planting was also important. He preferred planting in the back end much to spring planting. The roots of the trees got established before winter set in, and in the return of spring they grew so freely as to keep down the insects which usually come upon spring-planted trees. He looked upon October and November as the gaining of a year in the growth of the tree.

Mr. Cheal, Crawley, was next called upon. The title of his paper was "The Condition, Preparation, and After-Treatment of the Soil for Fruit Culture." The subject of fruit culture, he said, might be divided into two parts—above ground and below ground. It was little use attempting the cultivation of fruits without having a full knowledge of the soil, and how to make the most of it. It was the principal medium of food supply. The component parts of the land were not studied as they ought to be by orchard planters. Of course any soil could support plant life for a time, but soil to bear fruit year after year was robbed of a great many constituents that must, if success were to be looked forward to, be replaced. Apart altogether from a practical knowledge of soils, it was very desirable to have a chemical analysis, because many soils had not the chemical constituents that go to produce the finest of fruits. In this they had all much to learn. The soil, too, must have proper aëration. Its physical condition must be seen to if the best results are to be aimed at. The foundation of all good culture was proper drainage and deep cultivation, without both of these forest trees would no more prosper than the cereals or root crops of the farmer. There need be no apprehension about over-drainage, unless on very light soils, and then clay could be used as a top-dressing with excellent effect. The heat of the sun acted favourably on all well-drained lands, also improving the quality and hastening the maturity of the fruit. In breaking up the land for a plantation of fruit trees, it was much the better plan where practicable, to follow a root crop that had been well manured,

and where the land had been deeply stirred. Mr. Cheal spoke favourably of the steam-plough, the best digger. He wanted deep digging with any implement you like, only it must not leave the soil topsoil; the sub-soil must be left below, and the surface soil above. He had used an implement with a couple of prongs under the share of the plough which stirred the subsoil and did all that was wanted at much less draught than ordinary subsoil ploughing. The first cost of this work might be heavy, but the ultimate benefits were much greater. He did not approve of hole-making at certain distances and planting the trees therein, because of the tendency in most lands of the water draining into these holes and destroying the roots of the trees. In some instances where trees were planted in grass, no other method was practicable; only surface, or rather shallow drains, ought to be made at each hole to carry away accumulated water. It was much better to skim fallow waste land for a year in order to get rid of the weeds, than to plant and then have to do battle with them when the trees were growing. It was much better, in his opinion, to put sheep to eat down the pasture among the fruit trees than to allow the grass to grow into hay; this long grass intercepted the influence of the sun and stole away the richness of the soil itself. In any case, the turf should be kept clear of each tree, and a forking take place to allow the influences of sun, air, and moisture to play upon the roots.

Mr. Wright, of Hereford, next read a paper on "Fruit-growing for Profit." He said that the fruit grower's task was about the most difficult one in the whole rôle of the cultivation of the land. He had to contend with a combination of circumstances any one of which might imperil the ultimate success of the year's produce. Many of these mishaps might be reduced by a proper regard in the selection of the sorts of fruit most suitable for the district, together with that attention to soil, drainage, site, and intelligent management. He had put down about 6000 trees of various sorts, chiefly Apples, which he looked upon as the safest crop all round, although he would not advise any grower to stand by one article, as a variety of the many hardy fruits gave a better chance of doing on the average. He had himself experienced a heavy loss in the years 1887 and 1888 in the moth attacking his Apple trees. To such an extent was this done, that before he could check it, with its insidious movements within the bark, he lost a three-years' crop, and had to fall back upon the other produce to, in a measure, recompense him. He appeared to get his fruit trees into a profitable bearing state much sooner than the five years named by several of the speakers. From the young trees he was enabled to pick fruit that brought the highest prices in Covent Garden Market, showing that good culture and the proper picking and packing of fruit would pay. He had sent to the Manchester market this year Peasgood's Nonsuch Apples that fetched 30s. per cwt., when the best American Apples, at Liverpool, only realised per barrel of 120 lb., 19s. 3d. This was a most satisfactory state of things. He counselled the planting of the early large-growing sorts as being the most profitable. He also referred to the pamphlet sent out by the Royal Horticultural Society, with the combined opinions of forty experts as being a valuable help for intending cultivators, but they recommended Blenheim Orange Apple, but he would say with reference to that variety to all planters, "Don't." With soft fruits they had not so many rivals as with the Apples and Pears, and as it was not advisable to put all their eggs in one basket, they could meet their continental brethren in a fairer field of competition with these soft fruits. Altogether, he said it would be a wretched season if the whole of the crops failed.

Mr. James Anderson would like to have an authoritative opinion at this important conference on the question, How long ought trees in an orchard to be kept and yield profitable returns? He instanced the case of Mr. Matthews, of Gourdhill, in the lower reaches of Perthshire, as one of the greatest authorities forty years ago, and a voluminous worker to boot. In those days, his orchard, which was a very large one, paid handsomely, as well as some others along the course of Gowrie; but now these trees were centenarians, and the produce was smaller, and the quality not much better in some sorts than the wood itself. He would therefore like to have the opinion of those who were familiar with the orchards of Kent as to the age when the trees of the orchard should be replenished.

Mr. Cheal said that he knew hundreds of acres of Apple trees where the trees were 90 years old, and he could state, for the last fifteen years, the net

profit from these trees was £10 per acre. A Pear tree was instanced by a gentleman which bore 300 lbs. this season, and yet it was 100 years old. These were looked upon by the Conference as exceptional cases.

NATIONAL AURICULA AND CARNATION AND PICOTEE.

THE annual general meeting of the members of these Societies was held on the 27th inst., at the Hotel Windsor, by the permission of the Horticultural Club, Martin R. Smith, Esq., in the chair, there being a full attendance of members. The fifteenth annual reports were read by the Secretary, which set forth, that in reference to the Auricula and Primula generally, most satisfactory progress had been made with their extended and improved culture; that the display made on the occasion of the annual exhibition in April last was remarkably good, despite an adverse season—so late, indeed, that not a single northern grower was able to participate; and that it was noticeable how the older varieties of Auriculas, with the exception, perhaps, of Healy's George Lightbody, were giving place to the new and improved varieties put into cultivation during the past few years. The collections of species of Primulas were both interesting and instructive, the gold-faced Polyanthus much better than for a few years past, and the border Primroses and Polyanthus a leading feature as usual. The judges were thanked for their services, and the Horticultural club for allowing their room to be used for the purposes of the Society, free of charge.

The report of the Carnation Society set forth that a gratifying progress had to be reported; and that comparing the fifteenth exhibition held in July last with the first held by the Society, the advance was truly remarkable. The season of 1891 was decidedly adverse to the production of good blooms, and many growers were unable to exhibit. The special prizes given by Mr. Martin R. Smith, for border Carnations, produced a supplemental show of a popular character, a large number of blooms being staged. The balance sheet of the Auricula Society included among receipts, the sum of £70 6s. 6d. received as subscriptions; prizes paid, £62, and a balance of £8 18s. 5d. is carried forward to next year. That of the Carnation and Picotee Society shows among receipts, subscriptions amounting to £71 11s. 6d., and of expenditure, the sum of £48 15s. paid in prizes, a much smaller sum than usual, owing to the paucity of exhibitors; a balance of £21 15s. is carried forward to next year. The reports and balance sheets were adopted. Ten new members were elected to the Auricula, and five to the Carnation Societies. The election of officers for the ensuing year was then proceeded with, Sir John D. T. Llewellyn, Bart., was elected President of both Societies, but in the event of Sir John declining the Presidency of the National Carnation Society, Mr. Martin R. Smith will be the President for the ensuing year. The Vice-President and Committee were re-elected, Mr. Arthur Veitch being added to that of the National Carnation Society. Mr. T. C. Harwood was re-elected treasurer, and Mr. J. Douglas, secretary of both societies. The date of the Auricula show was fixed for April 20, and that of the Carnation show for the last Tuesday in July, subject to the arrangements of the Royal Horticultural Society. It was resolved that, in the interest of country exhibitors, the time for staging the flowers should be extended to half-past 11 o'clock. A letter was read, asking that classes might be provided both for Auriculas and Carnations grown within a radius of 4 miles from Charing Cross, with a view of encouraging *bona fide* town culture of these plants; but the matter was postponed, and several suggestions, with a view of improving the schedules, were considered, but not adopted. It was understood that the judges would be appointed by the committee at a meeting to be held in January next. A hearty vote of thanks to Mr. Smith for presiding brought the proceedings to a close.

NATIONAL CHRYSANTHEMUM.

OCTOBER 28.—A meeting of the above society took place at the Royal Aquarium on the above date, Mr. C. Harman Payne in the chair; when a considerable number of new Chrysanthemums were staged. From M.M. Ernest Calvert, fils, Grenoble, France, came a collection of new varieties, which having been well packed had travelled well, Japanese Mrs. C. Harman Payne, a very fine and full-petalled variety like a pale W. Tricker, was awarded a First-

class Certificate of Merit; Secrétaire Richard Dean, a very promising pale flower of decided promise the Committee wished to see again; also Madame A. Girond, a seedling from Edwin Moynoux. From Mr. Cox, The Gardens, The Grange, Hertford, had Japanese Charles Cox, rosy-pink, in the way of H. Elliott, but scarcely full enough; and D. B. Crane, like Sarah Owen, and not considered to be sufficiently distinct. Mr. R. Owen, nurseryman, Maidenhead, sent a large number of seedlings, mainly English raised, including Confidence, Japanese, bright rosy pink; Mrs. Nisbett, bright deep amaranth; and Snowflake, a pretty white pompon: all of which the committee wished to see again. From Messrs. Henry Cannell & Sons, nurserymen, Swanley, came Japanese Florence Davis, a large white variety, somewhat green in the centre; and Mr. C. Gibson, The Gardens, Mordeu Park, had the same, and in both cases the committee wished to see it again. From Swanley came also pompon William Kennedy, crimson amaranth, very bright; Beauty of Eynsford Anemone, soft pinkish lilac, with creamy pink centre, very pretty and fine (First Class Certificate); and Louis Boehmer, the new hairy petalled variety from America; but not being fully developed, the committee wished to see it again. Mr. William Wells, nurseryman, Earlswood, had William Wells, the promising sport from Madame Blanche Piquy, and Messrs. H. Cannell & Sons had the same variety. A commendation was awarded to Mr. Wills for his examples, and he also had Mrs. Wells, a delicate blush Japanese of a very promising character. Mr. W. E. Overstone Gardens, Northampton, had William E. E. a sport from Empress of India, which had reverted to the type from which Empress of India sprang, and was considered not sufficiently distinct. Mr. W. J. Godfrey, nurseryman, Exmouth, had Japanese Magnificent, deep pink, in the way of Bouquet Fait; and Beauty of Exmouth, a very promising white variety, which the committee wished to see again. From Mr. C. Blick, gr. to M. R. Smith, Esq., Hayes Common, come incurved Madame Darrier, a very distinct variety (First Class Certificate). From Mr. T. S. Ware, Hale Farm Nurseries, came Amos Perry, a large yellow Japanese in the way of Henry Cannell, which the committee wished to see again.

NURSERY NOTES.

CHRYSANTHEMUMS AT MESSRS. J. VEITCH AND SONS.

THERE is a fine lot of Chrysanthemums at this nursery, which make an effective display. The general effect is somewhat discounted because the plants are too much dispersed, whilst if all were grouped in banks, they would make an exceptionally fine show. At the time of our visit, a specially well-grown lot of plants stood in single file on either side of this corridor walk. A big collection was grouped in one of the show-houses close at hand, and a rather later lot was in another house. Of the varieties in bloom, we noted, of incurved, M. W. Brabant, the new red-bronze variety; also Thorpe Junior, Violet Tomlin, White Globe, Irène, and Dr. Sharpe; and Chevalier Domage, reflexed. The collection is rich in Japanese, and includes Janira, J. Delaux, W. Holmes, Alfred Chantier, Mlle. Mélanie Fabre, Source n'Or, Blanche Neige, Madame Rosain, Madame B. Pigny, Maiden's Blush, Madame de Sévin, William Clarke, Macaulay, Criterion, Lady Selborne, Bouquet Fait, La Triomphante, Elaine, Mandarin, Phebus, and Madame Rendatler. This is but a very limited list of a fine collection, which should be seen at its best early in November. Naturally, in an early notice of Chrysanthemum collections, the early bloomers get first attention. What is but too evident in every case is that dry, fine weather is sadly needed to perfect the flowers.

TRADE NOTICE.

PIRACY OF ILLUSTRATIONS.

MESSRS. SUTTON have suffered, like others, from the talent for "conveyancing," as the wise it call, exhibited by certain persons. Their engravings

have been reproduced by Mr. A. Blanc, of Philadelphia, and it is alleged that electros are sold in this country in an unauthorised manner. Catalogues are now in course of preparation, so that it is desirable it should be known that a British illustration pirated in the United States and published in this country, is as much an infringement of copyright as if the copy were made and issued in the United Kingdom.

Obituary.

MR. HENRY GLASSCOCK.—This gentleman, a well-known cultivator and exhibitor of the Dahlia, died very suddenly at his residence, Rye Bank, Bishop's Stortford, a few days since, at the age of seventy-one years. He was always a familiar figure at the annual exhibition of the National Dahlia Society at the Crystal Palace, and acted as Secretary for a few years on the death of Mr. Thomas Moore. He was a florist of many years standing, and at one time a cultivator of Pansies, later of Fuchsias and Roses, with other things, but more recently devoting himself to the Dahlia, and being very successful as an exhibitor. Born at Bishop's Stortford, and by profession a builder and brickmaker, he took a great interest in all matters connected with the town, and was a member of the Local Board of Health from 1875 to 1890. His death creates another vacancy in the rapidly-thinning ranks of the florists of a past generation, as he had been identified with floricultural societies for nearly half a century. Mr. Glasscock is deeply mourned by a large family, and his fellow townsmen.

MISS KITCHEN.—The recent death of this lady at the "Orange Tree" Inn, Butley, near to Macclesfield, deserves a passing notice. For something like seventy-five years, a Tulip show has been held at the "Orange Tree" Inn, which has been in the tenancy of the Kitchen family for over a century, and one of the family has always held the post of Treasurer and Secretary of the show. Miss Kitchen had held these offices for a considerable time, and the success of the annual exhibition was due in a large measure to her exertions; and she will be greatly missed and sincerely mourned by the Cheshire Tulip growers. More than ordinary interest will attach to the Butley show next year, as Mr. Samuel Barlow, J.P., will offer a handsome silver cup, value 10 guineas, to be competed for on that occasion.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

MEALIES AND WEEVILS.—A correspondent from the Transvaal asks for information as to the best method of preserving mealies (*Zea Mays*), from the attacks of weevils. Our American friends are said to have a plan of protecting the mealies, or of drying them in a kiln. Perhaps exposure to the vapour of bisulphide of carbon would be effectual, but we should not care to recommend this dangerous substance without trial. See also p. 522.

BEARDED CHRYSANTHEMUM CULLINGFORDII.—Has any reader of the *Gardeners' Chronicle*, asks Mr. Ebbutt, ever seen or heard of a bearded Chrysanthemum Cullingfordii bloom? He says, "I have a plant here with two blooms that are freely bearded on the reverse of petals, the hair-like growths measuring a quarter of an inch in length."

Table listing prices for cut flowers such as Asters, Freuch, Carnations, and Chrysanthemums, with columns for s.d. and s.d. s.d.

ORCHID-BLOOM IN VARIETY.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for plants in pots such as Adiantum, Aralia, Aspidistra, and Begonia, with columns for s.d. and s.d. s.d.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for vegetables such as Artichokes, Beans, Beet, Carrots, and Cauliflowers, with columns for s.d. and s.d. s.d.

POTATOS.

SPITALFIELDS: Oct. 27.—Quotations:—Magnums, 60s. to 75s.; Regents, 60s. to 70s.; Champions, 55s. to 65s.; Imperators, 60s. to 80s.; Hebrons, 60s. to 80s.; Early Rose, 60s. to 60s. per ton.

BOROUGH: Oct. 27.—Quotations:—Hebrons and Elephants, 70s. to 85s.; Imperators, 60s. to 75s.; Bruce Magnums, 60s. to 80s. per ton.

STRATFORD: Oct. 27.—Quotations:—Magnums, 60s. to 80s.; Imperators, 60s. to 75s.; White Elephants, 60s. to 75s.; Hebrons, 60s. to 75s. per ton.

FRUITS AND VEGETABLES.

SPITALFIELDS: Oct. 27.—Quotations:—English Apples, 3s. to 6s. per bushel; American do., 10s. to 20s. per barrel; Pears, 1s. to 2s. 6d. per half sieve; English Tomatoes, 5s. to 7s. per peck; foreign do., 1s. to 2s. per box; Prune Plums, 3s. 6d. to 3s. 9d. per half sieve; Damsons, 3s. to 3s. 6d. do.; Bullaces, 1s. to 1s. 6d. do.; Seakale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. to 3s. 6d. per tally; Savoy, 2s. to 3s. do.; Greens, 1s. to 1s. 6d. per dozen bunches; Spinach, 1s. to 2s. per bushel; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Turnips, 2s. to 2s. 6d. per dozen bunches; Parsnips, 4d. to 6d. per score; Cauliflowers, 3s. to 7s. per tally; Carrots, 1s. to 2s. 6d. per dozen bunches; Endive, 9d. to 1s. per dozen; Cos Lettuce, 4d. to 8d. per score; Cabbage do., 3d. to 4d. per dozen; Leeks, 2s. to 2s. 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 1s. 6d. to 5s. per cwt.; Belgian do., 2s. 9d. to 3s. 3d. per bag of 110 lb.; Spanish do., 6s. to 6s. 6d. per case; Celery, 6d. to 10d. per bundle; Parsley, 1s. 6d. to 2s. per dozen bunches; Horseradish, 1s. to 1s. 1d. per bundle; frame Cucumbers, 1s. to 2s. per dozen; Radishes, 1s. 6d. to 2s. 6d. per tally; Beet-roots, 2s. to 2s. 6d. per dozen bunches.

BOROUGH: Oct. 27.—Quotations:—Cabbages, 2s. 6d. to 4s. per tally; Marrows, 2s. to 4s. do.; Broccoli, 4s. to 6s. do.; Turnips, 1s. to 1s. 6d.; Carrots, 1s. to 1s. 9d. per dozen bunches. English Onions, 4s. to 5s. per cwt.; Apples, 2s. to 9s., and William Pears, 2s. to 7s. per bushel.

STRATFORD: Oct. 27.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Cabbages, 2s. to 4s. 6d. per tally; Savoy, 2s. 6d. to 5s. do.; Collards, 1s. 6d. to 3s. loose; Cauliflowers, 9d. to 1s. 3d. per dozen, and 3s. to 5s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 30s. to 40s. do.; do., cattle-feeding, 26s. to 32s. do.; Parsnips, 6d. to 1s. 3d. per score; Mangels, 17s. to 20s. per ton; Swedes, 20s. to 25s. do.; Onions, German, 5s. to 5s. 6d. per bag; do., English, 100s. to 115s. per ton; do., Dutch, 3s. to 4s. per bag; do., Ports, 5s. 6d. to 6s. 6d. per case; Apples, English, 2s. to 6s. per bushel; do., American, 12s. to 18s. per barrel; red Cabbage, 1s. to 1s. 9d. per dozen; Horse Radish, 1s. to 1s. 3d. per bundle; Sprouts, 1s. 3d. to 2s. per half-sieve, and 2s. to 2s. 9d. per flat packing Onions, 3s. to 4s. per packet.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Rows list districts 1-12 with corresponding weather data.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts:—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing, &c., Districts:—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending October 24, is furnished from the Meteorological Office:—

"The weather has continued very rough, squally, and unsettled generally, with frequent and heavy falls of rain in all but the northern and north-eastern districts. In several parts of the Kingdom—notably in Ireland—bright intervals of sunshine were experienced, and towards the end of the period a general improvement was in progress.

"The temperature has been rather below the mean in 'Scotland, E.' and 'England, N.E.' as well as over 'Ireland,' and equal to it in the western parts of 'Great Britain;' elsewhere it has exceeded the normal value, the excess in 'England, S.' having been 3°. The highest of the maxima were recorded either on the 21st or 22nd, and ranged from 64° in the 'Channel Islands,' to 55° in 'Ireland, N.' The lowest of the minima, which were registered on rather irregular dates, ranged from 27° in 'Scotland, N.' 29° in 'Scotland, E.' and 30° to 32° in most of western and northern districts generally, to 36° in 'England, E.' and the 'Midland Counties,' and to 45° in the 'Channel Islands.'

"The rainfall has been less than the mean in the north and east of Scotland, the north-east of England, and the north of Ireland. In all other parts of the Kingdom there has again been a large excess.

"The bright sunshine has just equalled the mean in 'England, S.' and the 'Channel Islands,' but has been above it in all other districts. The percentage of the possible amount of duration ranged from a little above 50 in 'Ireland,' and from 40 in 'Scotland, E.' to 29 in England, S. and N.W."

NOTICES TO CORRESPONDENTS.

ABIES OR PICEA, PICEA OR ABIES: X. We fully admit the inconvenience, but this is rapidly disappearing now that we have an authoritative standard in Bentham & Hooker's Genera, to which all should be prepared to pay loyal obedience, unless they can show sufficient cause to the contrary. The system of calling the Silver Firs Picea, and the Spruce Abies was and is confined

for the most part to this country. In all other countries, and in the modern books of authority, without exception, the practice is that adopted in Bentham & Hooker, and this for the sake of uniformity should be upheld.

BOOKS ON FRUIT GROWING: Leon. There is not much to learn that is new on fruit culture. For practical information about cultivating and training various kinds of fruit trees, Scientific and Profitable Culture of Fruit Trees, by M. Du Breuil, English by W. Wardle (Lockwood & Co., Stationers' Hall Court); Subtropical Cultivation and Climates, by R. C. Haldane (Blackwood & Sons, Edinburgh and London). Probably other and better books on the subject could be obtained from the foreign booksellers.

BOOKS: J. How to Lay Out a Garden. By E. Kemp. (Out of print).

CORRECTION.—In our mention of Messrs. Kelway & Son's special prizes in our last issue, we omitted to state that they also intend to give Medals for Delphiniums and Gaillardias.

DENDROBIUM FIMBRIATUM: E. C. The plant having just finished its growth, put it into a very light place, and close to the glass, and where the temperature does not go below 60° or rise above 75°. Withhold water.

DRESSING FOR BOARD FENCES: J. S. We should say that Stockholm tar would be preferable to the deep black of either common gas tar or black varnish, and it has moreover the advantage of not being sticky.

FRUIT OF MONSTERA DELICIOSA: A. R. You plucked the fruit before it was ripe. When quite ripe, it has a delicious flavour. To avoid the irritation caused by the spine-like crystals, thrust a quill into the fruit, and suck the juice through the quill. The fact of your having grown the plant out-of-doors during the past summer accounts for the late ripening of the fruit. It must stay on the plant till ripe.

GINKGO: B. We are not aware whether this tree has fruited in this country. It is dioecious, and the best plan of securing fruit would be to do as A. P. de Candolle did many years since—graft a scion of the male on the female. Most of the trees in this country are males, but on the Continent, and in the United States, the female is now also common.

GRAPE DROPPING: An Anxious One. The Grape-room is too damp.

MARKET TULIPS: J. G. W. Probably Alba maxima, Rose blanche, or Marriage de ma fille; we do not know which with certainty.

NAMES OF FRUITS: J. S. N. 1, Grosse Calebasse; 2, 3, Beurré Bosc.—R. T. F. A small Emperor Alexander.—Thomson. Apple: 1, Grange's Pearmain; 2, Winter Majetin; 3, Sturmer; 4, Dumelow's Seedling. Pears: 1, Pitmaston Duchess; 2, Easter Beurré; 3, Catillac.—J. Borlase Tibbits. Your Apple is the Frogmore Prolific.—P. Bogie. Apple: Alfriston.—G. W. 1, smashed; 2, Louise Bonne of Jersey; 3, Beurré Bosc.—C. P. & Co. Pear: Caillot Rosat.—Henry Smith. Pear: Colmar d'Été. Apple: Jolly Bigger.—W. G. Sorby. Apple: Cellini. Pear: Pitmaston Duchess.—F. Pearce. 1, Hollandbury; 2, Cox's Pomona; 3, not known—probably a local variety.—Pomona. 1, Autumn Pearmain; 2, Red Streak; 3, Winter Peach; 4, Marie Louise d'Uccle; 5, Beurré de Capiaumont.—G. J. J. 1, Tom Putt; 2, Reinette du Canada; 3, Verulam. Others not determinable from such poor specimens.—W. P. 1, Duchesse d'Angoulême; 3, Maréchal de la Cour; 4, Thompson's; 5, Brown Beurré; 6, Alexandre Lambre; 7, King of the Pippins; 8, Striped Beefing; 9, Gloria Mundi.—J. S. 1, King of the Pippins; 3, Colonel Vaughan; 5, Northern Greening; 6, Reinette du Canada. Others not recognised.—H. R. G. Apples: 2, not recognised; 1, Hawthornden; 2, Grange's Pearmain. Pear: Louise Bonne of Jersey.—Scottie. Apples: 7, Mannington's Pearmain; 8, Autumn Pearmain; 9, Rymer; 14, De Marais; 15, Beurré Rance; one without number, Beurré Diel.—F. Thirly. 1, Beurré Clairgeau; 3, Beurré de Capiaumont; 4, Old Colmar; 5, Duchesse d'Angoulême; 6, Seckle; 7, General Todleben.

NAMES OF PLANTS: Blue Bell. Aster macrophyllus.—A. A. 1, Epidendrum, section Encyllum, possibly new. Please send more complete specimen if possible, and state its origin; 2, Sarcanthus teretifolius.—A. J. B. 1, Sedum spectabile; 2,

Euonymus radicans; 3, *Monarda didyma*; 4, *Spiraea filipendula*, double fl.; 5, *Phalaris arundinacea variegata*; 6, *Jasminum officinale* var. *grandiflorum*.—*R. R.* *Adhatoda cydoniifolia*.—*W. S. C. Pinwell* 1, *Digitalis thapsi*; 2, *Campanula lamiifolia*; 3, *Carthamus lanatus*; 4, *Potentilla argentea*.—*F. P. Z.* *Ceropegia*, a new species. Can you oblige with a better specimen, with particulars for description, as it was withered before it could be attended to.—*Alfred Fryer*. 1, 1, *Setaria viridis*; 2, *Amaranthus chlorostachys*.—*J. W. M.* 1, *Pellionia pulchra*; 2, *Salvia splendens*; 3, *S. gesneriifolia*; 4 and 5, *Dracenas*, garden hybrids.—*E. R. Tortworth*, *Urginea comosa*.

OAK: *J. H. G.* Either the Fulham or the Lucombe Oak—we cannot tell which.

PINES BENTHAMIANA: *J. H. G.* This is a form of *ponderosa*, and does well in this country. There are some fine trees at Orwell Park, Suffolk.

PLANTS IN VINERIES: *A. B.*—Early vinery: *Roses*, *Gardenias*, *Lilacs*, *Rhododendrons*, *Kalmias*, *Asparagus prostratus* var. *plumosus*, fibrous-rooted *Begonias*, *Staphylea colchica*, *Richardia aethiopica*, *Cactus Epiphyllum truncatum*, *E. Gartneri*, *Azalea indica*, *A. mollis*, Dutch bulbs, and *Eucharis* of species. Much plant forcing may be done in this house, if the roof is not crowded with *Vine foliage*. Late vinery: Most of the above, excepting the bulbs, which would be going out of season when the house is started. In this house many kinds of stove plants may either be started into growth, or placed therein after growing for some time in the stove; also *Heliotrope*, *Achimenes*, *Tuberosee*, &c. Very few greenhouse plants should be kept in a late vinery after it is started, unless it be cut back—*Epacris*, *Azalea indica*, *Ficus*, *Orangea*, &c., and these only until they have well broken.

TAGETES: *F. R.* Good, but not remarkable.

TEMPERATURES: *X. Y. Z.* *East Indian or Warmest House*: As most *Orchids* under cultivation in this country begin to grow in the spring, the temperature may be raised from 60° to 62°, at which the plants were rested to 65° by night, and by day to 70°, and with sun-heat to 75°. The warmth should be gradually increased as the days lengthen, and during the interval—May to August—it may range from 70° to 75° at night; and from 75° to 80° by day, or 85° to 90° with sun-heat, provided shade be afforded. In this house come *Vandas*, *Phalenopsis*, *Saccolabium*, some *Dendrobes*, and *Cypripediums*. *Brazilian and Mexican Orchids* should be accommodated at the growing season with a temperature at the commencement of 60° to 62° by night, with a 5° to 10° rise by day; and during the period—May to August—the night warmth may range from 65° to 70°, and that of the day 70° to 85°. Of course, with the lesser warmth, less moisture is required by the plants at the root, and in the air. *Odontoglossums* will succeed whilst growing in a temperature of 60° to 65° by day, and 50° to 55° by night; but while the plants are resting—that is in the winter mostly—a temperature of 40° to 45° by night, and 50° to 55° by day should be maintained. Some *Orchids* do not rest during our winter, as *Zygopetalum*, many species of *Aeides*, *Vanda*, *Phalenopsis*, &c., and such, will require water at the root at that period; but great care should be taken not to wet the young growths. These should be placed at the warmer end of the house. The cool house division should not fall below 45° at night during the winter, or rise above 55° in the summer; the day warmth at each period being kept at about 10° higher.

VINES: *J. F.* The *Vine* shoots were healthy, and quite free from mildew.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

RUSSIA MATS.—RAFFIA.

ARCHANGEL MATS and all kinds of PETERSBURG MATS imported direct, and supplied to the Wholesale Trade only, at much lower prices than any other firm.

Mr. ARTHUR ALLSOPP, of Trentham Gardens, as Gardener to VISCOUNT PORTMAN, Bryanstone, Blandford.

WANTED,

December 1, by one of the first German Seed Houses, a

THOROUGHLY EFFICIENT ENGLISH CORRESPONDENT.

Preference given to one who knows the Trade well and has some knowledge of French and German, and writes Shorthand. The situation is a good and permanent one.—Address, giving full particulars of experience, references, &c., to A. B. Messrs. Watson & Scull, 90, Lower Thames Street, London, E.C.

WANTED, a PARTNER, with about £150.—Business doing well, in the city of Bath.—Address, X. C. X., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED.—The Undersigned wishes to communicate with a Young Man who has a thorough practical knowledge of Budding, Grafting, and general management of Fruit Trees, a man with good Intelligence and Energy, and used to working a large staff of men, as SUPERINTENDENT, to start a large Fruit Farm in Cape Colony. Married man preferred. Free passage out. Salary liberal. Only thoroughly qualified men, with first class references, need apply.—Address, Mr. CHAS. AYRES (of Cape Town), Henbury, near Bristol.

WANTED, a first-class GARDENER, used to West-End Trade; must be experienced in Window-Boxing, Furnishing, and thoroughly understand the treatment of Palms.—Apply, by letter only, to THE CRICHTON FLORAL COMPANY, 37, Sloane Street, S.W.

GARDENER.—Can any Gentleman RECOMMEND a thoroughly respectable married man as WORKING GARDENER (man and boy under him) for an English Gentleman's place in a quiet part of Ireland, where the upper servants are all English. Must thoroughly understand all Outdoor Work. To live in furnished entrance lodge. Wife willing and able to help in Laundry. No young children, but preference given to a man with a Son, as Yard Man.—P. BICKNELL, Esq., Foxgrove, Beckenham.

WANTED, IMMEDIATELY, a really good and competent all-round man as WORKING PROPAGATOR, GROWER, and HEAD GARDENER in a Private Place, where the produce is sold. Must be well up in growing and picking for Sale, and able to produce a good quantity of Cut Blooms, Cut numbers, Tomatos, Mushrooms, &c. Private Gardeners need not apply unless they have previously held similar appointments. Preference given to a married man without encumbrance. Applicant must be a good disciplinarian with undermen, and character to bear the strictest investigation as to industry, honesty, sobriety, and regularity. Wages 30s. per week and house.—Apply by letter only, to HORTICULTURE, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD WORKING GARDENER, who thoroughly understands Orchids; two kept.—GENERAL H., Owthorpe, Bournemouth.

WANTED, a WORKING GARDENER and Wife, without young children, to take Charge of Unfurnished House, adjoining town of Wantage, during the winter, or until let, and to Grow Vegetables, Fruit, &c., in Garden, Greenhouse, and Vinery for sale in reduction of wages.—Apply, stating age, wages, &c., to Messrs. ORMOND, Solicitors, Wantage, Berks.

H. CANNELL AND SONS are WANTING, to proceed to Africa, THREE or FOUR thorough practical, steady, intelligent MEN for the production of Apple and Pear Trees, and afterwards growing and packing the fruit to Europe. Free passage and good wages. Three years guaranteed to thoroughly reliable men. They also require a similar Man for their own Nursery. One who is competent to take and carry out the Shrub and Tree Department in a most business-like manner.—Particulars to Swanley, Kent.

WANTED, a MARRIED MAN, to take charge of a small Nursery. Thoroughly experienced in growing Tomatos, Cucumbers, Bouvardias, Maidenhair Fern, Chrysanthemums, &c.—E. CURRY, West Green Nursery, West Green, Tottenham.

WANTED, a MAN, to grow Mushrooms for Market. Must have had successful experience. First-rate testimonials required. Responsible place. Good wages. Share of profits. Write in first instance to AGARIC, 117, Chancery Lane, W.C.

WANTED, a young MAN, in a Seed and Florist's Shop. Must have a knowledge of Wreath and Bouquet Making.—B. MALLER AND SONS, Burnt Ash Lane Nurseries, Lee.

WANTED, for a Nobleman's Garden, a MARRIED COUPLE. Man required for Kitchen Garden Work and Nailing; Wife to look after young men's rooms. Liberal wages given, with Cottage, Firing, Milk, and Vegetables. First-class references required.—Apply, J. C. McPHERSON, Londesborough Park, Market Weighton, Yorkshire.

WANTED, a MARRIED COUPLE, no children; Man as GARDENER. Must understand Stock. Wife to occasionally Assist in House.—Apply, CHAPMAN, Chaplin Road, Wembley, Middlesex.

WANTED, an UNDER COWMAN.—A smart, active, superior, willing young man. Must be a clean, quick Milker, well up to attending first-class Pedigree Stock, and used to early hours. Wages, 17s. per week. Good personal character from last master indispensable.—Apply, by letter only, to HERDSMAN, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Seed Trade.

WANTED, a young man, as ASSISTANT. Must be a good Writer, and Quick at Parcelling.—State experience, wages required, and references, to DICKSON AND ROBINSON, Seed Merchants, Manchester.

WANT PLACES.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

Head Gardeners.

TO FLORISTS, or FLORISTS and FRUITERS.—A young Lady, thoroughly experienced, seeks re-engagement. Thoroughly well up in Posies, Bouquets, Wreaths, &c. Highest references.—WILLIAMS, 70, Hyde Street, Winchester.

HOLLOWAY'S PILLS and OINTMENT.—The attention of all sufferers is drawn to these well-known remedies, for they possess conspicuous advantages as a safe and reliable aid in all those emergencies to which travellers, emigrants, and sailors are so especially liable. They have been largely patronised by wayfarers by land and sea, and, in fact, by all classes of the community, to their very great advantage. The Pills are beyond all doubt one of the most effective remedies ever discovered for cases of obstinate constipation, confirmed indigestion and colic, complaints which are engendered by exposure and irregular feeding. The Ointment will be found of the very greatest service in cases of piles, abscesses, erysipelas, and all kinds of local ulcerations.

The "Analyst," comparing the flesh-forming ingredients in Cocons, gives the following average:—

	Price
"Flesh-forming ingredients in Natural Cocoa Nibs	13'00 "
"ditto ditto in the best Commercial Cocoa, with added Starch and Sugar	6'00 "
"ditto ditto in Cadbury's Cocoa, the standard English article	21'00 "

"The process of preparation concentrates the nourishing and stimulating principles of the Cocoa bean."
 "Cadbury's Cocoa being Absolutely Pure is therefore the best Cocoa." No Chemicals Used.

The Gardeners' Royal Benevolent Institution.

NOTICE is HEREBY GIVEN, that an ADDITION will be made to the PENSION LIST of this Institution in JANUARY NEXT.

All persons desirous of becoming Candidates will be required to send in their applications to the Committee on or before, NOVEMBER 14 NEXT after which day they cannot be received. Preference will be given to those applicants, or their widows, who have been on the books of the Institution as subscribers for fifteen clear years. Should there not be enough of these applicants to fill the vacancies, then the cases of those applicants who have not subscribed so long, or not at all, will be considered. Forms of application, and full particulars may be obtained of the Secretary—

G. J. INGRAM, 50, Parliament Street, London, S.W.

CAUTION.—In the Court of Session, Scotland, SUTTON and SONS v. BAXTER—NOTICE IS HEREBY GIVEN, That the Court has granted a PERPETUAL INJUNCTION, with costs, against the defendants, Messrs John Baxter & Sons, Printers and Publishers, Edinburgh, restraining them from infringing the Copyright of Illustrated Catalogues published by Messrs. Sutton & Sons, Seed Merchants, Reading. The defendants allege that they bought the electrots of illustrations from A. Blane, engraver, of Philadelphia, U.S.A. As numerous imitations of the illustrations in Messrs. Sutton & Sons' several Catalogues have been made, they give Notice to all engravers, printers, seedsmen, and other persons, not to print, publish, or circulate any illustrations copied from their copyright catalogues, and that legal proceedings will be taken against any person infringing their rights.

Dated this October 23, 1891. PLUNKETT AND LEADER, 60, St. Paul's Churchyard, London, E.C., Solicitors for Messrs. Sutton & Sons.

PAUL & SON'S

GREAT HARDY NURSERY,
CHESHUNT, N.

Invite Planters to Inspect and Select from their Stock of

PAUL & SON'S CHESHUNT ROSES.

STANDARDS—Demand large Early orders necessary.
DWARFS—Virtually all on the accepted stock—the Biar.
POT ROSES—The finest lot they ever held; therefore the finest in the world.
ROSE SPECIES and SINGLE ROSES—A specialty of the Firm.

PAUL & SON'S FINISHED FRUIT TREES.

STANDARDS, more especially APPLES, the very finest in the Trade. From £12 per 100 downwards.
PYRAMIDS, and all FORMED TREES, vigorous, and yet of best shapes.
All SMALL FRUITS, to ALPINE STRAWBERRIES, carefully tended.
Large Planters should see the Stock.

PAUL & SON'S HARDY TREES.

The variety of them is wonderful. By careful selection the smallest garden may be made a varied picture.
From 18s. per dozen.

PAUL & SON'S HOLLIES & EVERGREENS

Of every description, are moved and do well—notably Hollies, of which there are 8 acres at the Epping Forest Nursery, from 2 to 12 feet, 1s. to 5 guineas each.

PAUL & SON'S AMERICAN PLANTS.

The free-setting RHODODENDRONS and AZALEA MOLLIS—specialty at the High Beech Nurseries.

PAUL & SON'S CONIFERÆ.

The most varied collection in England. Special selections of ROCK GARDEN SHRUBS, and for Villa Gardens.
ARAUCARIAS in thousands, green and beautiful.

PAUL & SON'S HERBACEOUS AND ALPINE PLANTS.

For Borders, Rockwork, Cut Flower producing.

An acre of ROCK PLANTS at the Broxbourne Nursery.

ESTABLISHED 1807. Eighty-four years' continuous attention and application has made these Hardy Nurseries one of the most complete in Europe. Planters should see for themselves.

ROSE and other CATALOGUES on application to

THOMAS RIVERS & SON,
THE NURSERIES,
SAWBRIDGEWORTH, HERTS.

DAFFODILS.

JAMES VEITCH & SONS,

ROYAL EXOTIC NURSERY, CHELSEA, S.W.

ALBICANS.

Long drooping sulphur trumpet, changing to white as the flowers become fully expanded, with white perianth.
Per dozen, 6s.

BICOLOR HORSFIELDII.

(KING OF DAFFODILS.)

A splendid large free-flowering early variety; immense golden-yellow trumpet, with white perianth. Excellent for pot culture.
Per dozen, 9s.

BICOLOR GRANDIS.

Large golden yellow trumpet, with white perianth, as large as Horsfieldii, but about fourteen days later in bloom; tina flower of great substance, and excellent for succession.
Each, 1s.; per dozen, 10s.

EMPEROR.

The most noble and striking Daffodil in cultivation, of immense size and great substance, trumpet clear golden-yellow, with broad stout perianth; a most beautiful and desirable variety.
Each, 1s. 6d.; per dozen, 16s.

GOLDEN SPUR.

The largest and finest form of Major or Spurius, immense golden trumpet, slightly reflexed at mouth, perianth broad and twisted; a bold, striking, and very early-flowering variety.
Per dozen, 6s. 6d.

HENRY IRVING.

A bold and striking variety, having a large rich golden yellow wide trumpet, recurved at mouth, and broad clear yellow perianth.
Per dozen, 6s.

SINGLE DAFFODIL or LENT LILY.

Per 100, 2s.; per 1000, 17s. 6d.

DOUBLE DAFFODIL.

Large, double, deep golden-yellow flowers; very showy for planting, pot culture, or forcing.
Bulbs for Planting, per 100, 4s.; per 1000, 35s.
Strong Bulbs for Forcing, per 100, 6s. 6d.

INCOMPARABILIS CYNOSURE.

Large sulphury-white perianth, conspicuously stained orange-scarlet crown.
Per dozen, 2s.; per 100, 14s.

INCOMPARABILIS FIGARO.

Large flower, broad primrose perianth, with a very expanded yellow crown, slightly shaded with orange.
Per dozen, 2s. 6d.; per 100, 17s. 6d.

INCOMPARABILIS SIR WATKIN.

A magnificent variety, ranking with Emperor and Horsfieldii in size and beauty. First-class Certificate.
Each, 1s. 6d.; per dozen, 16s. 6d.

INCOMPARABILIS STELLA.

Very early, the first in bloom of this section; flowers pure white, with a yellow crown. Very attractive, and excellent for forcing.
Per dozen, 1s.; per 100, 5s. 6d.

LEEDSII MINNIE HUME.

Broad white perianth, with very large expanded pale lemon cup, shaded deep lemon at edge. A charming and desirable variety. The finest of this section.
Each, 3s.

BIFLORUS (Primrose Peerless Narciss).

Pure white, with yellow crown. A well-known and excellent variety for cutting, bearing two flowers on the same footstalk. Per 100, 2s. 6d.; per 1000, 21s.

BURBIDGEI.

Perianth white with a small yellow crown, deeply edged scarlet. Per dozen, 1s. 6d.; per 100, 9s. 6d.

POETICUS (Pheasant's Eye, or Poet's Narcissus).

A well-known hardy species, pure white, with red crown; very fragrant; fine for cutting.
Per 100, 2s.; per 1000 17s. 6d.

POETICUS ORNATUS.

Very early; broad pure white perianth, with red crown; flowers large and well-shaped. A very beautiful and useful variety. Per dozen, 1s. 3d.; per 100, 8s. 6d.

For full particulars of above and other varieties of Daffodils, as also Bulbs for Pot Culture or Planting see

Descriptive and Illustrated BULB CATALOGUE, forwarded Gratis and Post-free on application.

THE
Gardeners' Chronicle.

SATURDAY, NOVEMBER 7, 1891.

CROXTETH HALL.

THIS is the beautiful seat of the Earl of Sefton, and those who follow the movements of royalty will remember the visits of the Prince of Wales to Croxteth Hall, and of the Duke of Clarence and Avondale this year, when he opened the Royal Infirmary at Liverpool. The original seat of the family of Molineux was at Sephton, a place some miles distant, on the sea-board, near the mouth of the River Mersey, where a range of dreary sand-hills forms a barrier along the shore, which is lined with marshes, and covered with rabbit-warrens.

The Earls of Sefton trace their descent from William de Molineux, who is mentioned in the Norman chronicles, before the Conquest, as a man of noble origin, much esteemed by Duke William. Soon after the Conquest, this first Molyneux known to fame received the grant of Sephton, and made it his chief seat. Among many distinguished soldiers of a family of soldiers, from Duke William's favourite downwards, was Sir William Molineux, who was dubbed knight-banneret by the Black Prince on the field of battle, and of whom it is recorded in his epitaph that the third Edward "loved him as a friend." His son, Sir Richard, eminently distinguished himself at the battle of Agincourt, where he obtained his knighthood. The next Sir Richard married a sister of Thomas Stanley, Earl of Derby, and died the death of a soldier in 1459. His grandson, another soldier of much renown, fought at Flodden; and, next in order, may be mentioned the Sir Richard of Elizabeth's reign, whom that queen knighted, which is pretty good evidence that he deserved the honour. On the institution of the order of baronets, Sir Richard Molyneux was the second person advanced to the dignity. Rising to a higher seat, he was made an Irish peer by Charles I., with the title of Viscount Molyneux. The second viscount was engaged on the king's side at Worcester, and escaped that disastrous battle with difficulty. The next viscount was created Earl of Sefton in the peerage of Ireland, and his son became a peer of the realm by the title of Baron Sefton of Croxteth. Many of this distinguished family—lords, tenants, constables of Liverpool, or chief foresters of the royal parks and forests in Derbyshire—lie buried in Sephton church, which holds as much dust of once-eminent men as almost any village church in England. Sephton Hall, a stately pile surrounded by a moat, stood opposite the church, on high ground. But this earliest English home of the family of Molyneux was razed to the ground, and even the farm-house, which occupied its site, was removed four-score years ago. At the present time, a few heaps of stones, from the massive walls of the castle, are the sole witnesses of its existence.

The old family, however, have outlived their house, and Croxteth Park is, without doubt, a much more comfortable and elegant residence than its predecessor. It stands some 3 miles distant from Knowsley, in the parish of West Derby, and tram-cars from Liverpool run within less than a mile of its doors. The Hall is a very handsome house, built of brick, with stone "dressings" to the doors and windows, in Queen Anne style, which succeeded the mullioned windows and heavy gables and chimneys of the Jacobean and Elizabethan periods. The front was erected in 1702, and the back, formerly of wood and plaster, was rebuilt in 1802, and large additions were made in 1874, so that the present house covers a great deal of ground.

An extensive lawn has been tastefully planted with flower-beds and clumps of shrubs, and with timber trees not too thickly set, and not too near the house, so as to darken the windows, or obstruct the view into the park beyond. The most conspicuous of all the trees on the lawn, though not by any means the largest, is a variegated Evergreen Oak, with branches drooping on the grass. There are lawns, and flowers, and shrubs, on three sides of the house, and the approach-road, covered with white and grey gravel, winds pleasantly through thick clumps of evergreens, amongst which the Rhododendron and Yew abound. Outside is the park, with a capital cricket-ground on the east-side of the house, where the favourite game is often played, gentle and simple joining in it together. Looking back to the house, we see that its first floor, which would have been the ground-floor, is lifted 12 feet above the ground by a terrace, which is covered with handsome creepers.

In the kitchen garden department (ably managed by Mr. Barham), there are twenty-four houses, including six vicarries, a Pine-stove and Pine-pit, Melon-house, Cucumber house, Cherry and Plum-houses, two stoves, and several houses filled with flowers; Rose-house, and Azalea-house. A favourite Melon here is Conquering Hero, which is planted in 7-inch pots, covered with charcoal, to prevent canker, and plunged in 16-inch pots—a system found very successful. The garden walls are covered with fruit trees, especially Pears and Morello Cherries, each bearing good crops this year, though the former, in August was waiting for sun. Among the most successful Pears are Pomaston Duchess, Brockworth Park, and Bon Chrétien. In the Cherry-house, the trees planted in the borders do better there than those in pots. May Duke sets well, so does Elton and Black Tartarian. Among the Plums, planted in the border of a house, and doing well, we noted Jefferson, Kirke's, Reine Claude de Bavay, all favourites, especially the last, one tree of which bore a great crop this year on a little standard 6 feet high. Golden Drop is another favourite. Muscat Grapes were in capital order, good bunches ripening fast. The Black Hamburgh, in four houses, have all been specially successful. In one of these houses might be noted white paper-guards over each bunch, to keep off the drip from a roof which is somewhat flat.

In the three Peach-houses, the fruit, trained on iron trellises, and well-exposed to light, were full of colour; and, in fact, everything here betokens skilful and vigorous management, and an adroit handling of the forces at command. Larger staffs of gardeners, in our experience, have proved less effective than the Lancashire corps at Croxteth Hall. H. E.

NEW OR NOTEWORTHY PLANT.

CATTELEYA LABIATA LUDDEMANNIANA.

An exceptionally large form of this handsome Cattleya is now flowering in the collection of E. G. Wrigley, Esq., Howick House, Preston. The sepals and petals are of a light rose-lilac tint, the latter being fully 4 inches long, one of them 3½ and the other not less than 3½ inches across. The lip is 3¾ inches long and 2¼ inches wide, and when expanded is seen to have the characteristic narrow form of this variety.

The front lobe is deep crimson-purple, the blotches on the sides of the throat light yellow, and the disc veined with dull reddish-purple. It is indeed a giant flower, and from the gardener, Mr. W. Hough, we learn that the many people who have seen it all agree that they have not seen its equal in size. It is sufficiently typical in other respects. R. A. Rolfe.

KEW NOTES.

FURCRAEA PUBESCENS.—This small species of *Furcraea* was described by Professor Todaro in 1879, and has been accepted as a good species by Mr. Baker. A plant of it is now in flower in the succulent-house at Kew. It has lanceolate green leaves, 18 inches long, by 2 inches in width, the margins clothed with small spines. The scape is central, erect, 5 feet high, the upper half an elegant branched panicle bearing numerous flowers, each of which is 2 inches across, greenish-white and fragrant. The buds, ovaries, and pedicels are covered with a very fine grey pubescence. This species is elegant enough and small enough to deserve favour as a greenhouse plant. Its worst fault is its perishing immediately after it flowers, a fault which is common to all *Furcraeas*. W. W.

Streptocarpus Galpini, Hook. fil. (MS.)—This is a new species of *Streptocarpus* which has lately been introduced from the Transvaal to Kew, where it has just flowered for the first time. It belongs to the monophyllous section of the genus, and it has numerous many-flowered scapes which spring from the extreme base of the midrib of the leaf. The largest leaf so far is 8 inches long by 6 inches in width, the nerves very thick and fleshy, tinged with red on the under side. The whole leaf is clothed with a soft silky tomentum. The scapes are erect, 6 inches high, and the flowers develop in slow succession. A few days ago the Kew plant had fourteen flowers open together. Each flower is nearly 1½ inch across, and it differs from all other species of the genus in the shortness of its tube. The colour is a rich mauve-blue, with a conspicuous area of white in the throat. This is the prettiest of all the introduced species of *Streptocarpus*. Seeds of it were received from Mr. E. Galpin, of Barberton, last year. W. W. [The plant is figured in the current number of the *Journal of Horticulture*, Ed.]

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM SPECTABILE IN WESTERN CHINA.

THE discovery, a few years ago, of the Canadian *Cypridium arietinum* in the Chinese province of Yuonao, by the Abbé Delavay, was an interesting discovery to the student of plant distribution. Dr. Henry has since collected it in Central China, and Mr. A. E. Pratt nearer the Tibetan frontier. But in the collection recently made by the latter gentleman, now being determined at Kew, are some fine specimens of another Canadian *Cypridium*—namely, *C. spectabile*, whose presence in a wild state in that interesting region may therefore be taken as an ascertained fact. The collection is localised as "West Szechuen and Tibetan Frontier; chiefly near Tachienlu, at 9000 to 13,500 feet." Many other plants are common to China and Japan, and North America, but as Orchids are not usually very widely distributed, the above discoveries are certainly interesting. These are not quite isolated instances in the genus, however, for *C. guttatum*, which also occurs here, ranges right through Eastern Asia to Alaska, in North-western America. It is also interesting to note that Dr. Henry collected *C. japonicum* in Central China, as formerly it was only known from Japan. R. A. Rolfe.

CATTELEYA BOWRINGIANA.

Everywhere this beautiful and free-growing introduction of Messrs. Jas. Veitch & Son is flowering and brightening the Orchid-house with the cheerful

rosy-purple of its flowers. A sample of a remarkably large and highly-coloured variety comes from Mr. John Smythe, Bitterne Park Gardens, Ringwood, Hants, accompanied by the following remarks, which, as they express the general opinion of the plant, are worth quoting. Mr. Smythe says:—"I send you flower of a good form of *Cattleya Bowringiana*. It is one of my first favourites. I have plants with five spikes, and some of them bearing twelve flowers each. Is not this rather good? A grander sight for the dull season you could scarcely imagine. The plants have done well with me; I only had them three years ago, and they were then small, and with only one little break each. A houseful of it now would be a sight!"

RENANTHERA ROHANIANA

is an evergreen plant with distichous leaves, and in every respect its habit is similar to that of the *Vanda*, but the flowers differ from that genus in having a pointed and movable lip, which is destitute of any spur. The plant being a native of the warmest and moistest part of Borneo, it is natural to infer that it thrives best under cultivation in the heat of the East Indian-house; but it is quite surprising to see the low temperature these plants put up with during winter with impunity. We know a plant of R. Lowii which has been subjected to as low a temperature as 58° and 60° during the last three or four years, suffering only in not developing its flower-spikes, but the general health of the plant is not diminished. The flowers of this plant are borne upon long pendent spikes, those at the base being four in number, the ground colour being rich orange-yellow, thickly spotted with purplish-black. A considerable space is bare between these and the ordinary flowers, which are narrower, much undulated at the margins, and entirely of a different colour, having a white ground thickly blotched with large and irregular markings of blood-red. The plant likes a moist atmosphere when growing; and during the winter if kept cool, great care must be exercised in giving it water, but under no circumstances must it be allowed to suffer from drought. *Orchid Album*, vol. x., part 109.

TRIXPERMUM BERKELEYI.

As may be inferred, this is not a large-flowered and startling beauty, for its flowers are not more than 1 inch or 1½ inch across the widest part. Its leaves seldom exceed 6 or 8 inches across; the raceme is pendent, the flowers much crowded upon the stem, and, as before stated, measuring 1 inch or 1½ inch across; these are thick and waxy in texture, but we could not perceive any perfume arising from them. As the flowers of many Orchids are odoriferous at various times in the day and night, we can only say that at no time when we tried the plant did we perceive any odour. The plant is very free-flowering, and the bloom lasts a long time in perfection. It should be grown in small hanging earthenware pans, which should be well-drained, and hung up near the roof-glass, in order to let the plant have as much light and air as possible, but yet it must be shaded from the direct rays of the sun through the middle of the day. A little chopped sphagnum moss and some nodules of peat fibre and charcoal will be all that is necessary about its roots, but the plant must always be kept moist during the summer season by spraying with water from the syringe, a moist atmosphere, and by water to its roots; and in the winter by more careful attention to its wants. Under no circumstances should the plants be allowed to suffer through drought, and a warm part of the East Indian house suits it at all times. *Orchid Album*, vol. x., part 109.

CYPRIPEDIUM × ENFIELDENSE, n. hybr.

This handsome hybrid was raised in the collection of A. J. Hollington, Esq., Forty Hill, Enfield, by Mr. Ayling, from *C. Lawrenceanum*, crossed with the pollen of *C. Hookeræ*. It may be described as an improved *C. × marmorophyllum*, which it most closely resembles, though the latter differs in having *C. barbatum* instead of *C. Lawrenceanum* for one

parent. The foliage of *C. Lawrenceanum* and *C. Hookeræ* are very similar, and that of *C. × Enfieldense* is naturally of the same type. The dorsal sepal is very broadly ovate and subacute, stained and nerved with purple on a light-green ground, paler towards the margin. The petals are reflexed, and much like *C. Hookeræ* in their bright-purple colour, but not quite so broad near the apex. The lip and staminode are intermediate in character. It is a bold and effective plant of good form and colour.

MICROSTYLIS METALLICA.

A plant of *Microstylis metallica* is now in bloom in the Birmingham Botanical Gardens, a lovely terrestrial Orchid, of dwarf habit, with a long slender raceme of flowers, of which the odd sepal is yellow,

dington, and Twickenham. Only two houses, and not large ones, are devoted to *Chrysanthemum*, for it is a very small place, and Orchids in considerable variety, with table and other small decorative plants seem to almost monopolise the houses. Our purpose just now is with the *Chrysanthemum*, for with the exception of a batch of *Cypripedium Spicerianum*, there is not much in the Orchid line in bloom. The collection comprises most of the best Japanese incurved, reflexed, and *Anemone* sections, perhaps not more than 200 plants in all, but then every one is carrying fine flowers. Mr. Furze always stands prominent in the competitions, and when his very limited area of glass is seen it is wonderful that he should do so well. Perhaps the secret of producing really good class flowers is found in moderation in

were the best, and the flowers superb, including the new hirsute variety *Louis Bœhmer*; it is evidently a first-class show variety, and is a robust grower. A fine yellow, Mr. H. Summers, blooming from the crown-bud, on a plant 2 feet in height, has a good flower; but on another plant, 3 feet in height, on which terminal buds were taken, are much finer flowers. Flowers of *E. Molyneux*, so beautiful on some plants, were very poor on others, the petals being thin and incurved. Mr. Coombs holds that when plants of this variety show such tendency, they should never be used for propagation, only the plants which have really fine reflexed flowers should be retained for that purpose. The new *Puritan*, a pleasing pink, was good; and the reddish chestnut, *Gloire de Rocher*, seemed to be a flower that will appear well on the show-boards. A beautiful rich-coloured variety is *M. Bernard*, of others *Val d'Andorre*, *Jeanne Delaux*, *Sarah Owen*, *Madame J. Laing*, *Avalanche*, *Stanstead White*, *Condor*, *Sunflower*, *Belle Paule*, *Mons. Tarin*, *Volunteer*, *Charlie Sharman*, *Gloriosum*, *Etoile de Lyon*, terminal flowers of fine colour; *Madame J. Pigny*, *John Lambert*, *Madame C. Audiguier*, *Maitha Harding*, and *R. Brockbank*, made up numerous and high-class flowers. Perhaps because standing somewhat thinly, and especially near the glass, the blooms seem not to have suffered at all from damp, and yet so near the river Thames, in a low-lying district, and with such a continuous rainfall, such a misfortune as bloom-damping might have been looked for. Judicious firing, with plenty of air, however, has admirably kept down that trouble at Teddington. *A. D.*

PICEA PUNGENS.*

We avail ourselves of the opportunity afforded us by Mr. Anthony Waterer to figure the cone of this beautiful Spruce. Up to this time the cone has, we believe, not been illustrated. *Picea pungens* is now gradually becoming known, but it is worth while mentioning that it varies in colour from dark apple-green to the most beautiful silvery tint, as in the variety known as *argentea*, which is even more beautiful than the var. *glauca*, originally known as *Parryana glauca*. It is widely different from, and, in this climate, far inferior to, *P. Engelmanni*, which is often confounded with it. *P. pungens* is perfectly hardy, and its colour remains throughout the year, though naturally brightest in spring. It does well even in the vicinity of towns, so that we can strongly recommend its extended culture as an ornamental tree. It is too early to say anything definite about it as a timber tree, but at least we may say that it promises well, as it grows fast, and is very hardy. We add in a note a few particulars for the use of the botanist. *M. T. M.*

FLORISTS' FLOWERS.

THE PENTSTEMON.

The question was asked recently if the garden varieties of the *Pentstemon* were hardy. These plants are generally considered to be hardy, but it is really only to a certain extent, and in some parts of the country. In the neighbourhood of London they are not hardy, although in mild winters most of the plants will survive, and make beautiful objects, well-furnished with flower-spikes the following season. In a severe winter most of them will die, therefore it is always desirable to make sure of

* *Picea pungens*, *Engelmann* (syn. *Parryana* and *commutata*, hort.).—Fragrance aromatic. Bark rich orange. Pulviti orange, flask shaped, but four-sided; truncate. Leaves on old branch, arcuate, linear-acuminate, four-sided, 10 to 15 mill. long. Leaves on the growing branches 2 to 3 cm. long, arcuate, linear mucronate, four-sided, with four to six rows of stomata between each of the prominent green angles. Buds ovoid cone, sparsely scattered. Scales oblong, membranous, light brown, recurved at the edges above. Male flowers not seen. Cones pendulous, 7 cm. by 4, oblong, conoid. Bracts much shorter than the scale, membranous, cuneate, rhomboidal acuminate, lacinate at the upper edge. Scales light glossy brown, undulate, broad at the base, orate obtuse, wavy, lacinate, and more or less recurved at the tips. Seed with an obovate wing.

FIG. 73.—CONE OF PICEA PUNGENS.

lateral sepals one side rose-coloured, the other yellow, petals rose, and peduncle violet. Leaves oblong acute, of a deep metallic blackish-purple colour above, and rose-coloured underneath. It is a Borrean species.

CHRYSANTHEMUMS AT MR. FURZE'S.

CHRYSANTHEMUMS are well done in the garden of Mr. Furze at Teddington, by his gardener, Mr. Coombs. There is one characteristic about Mr. Furze in regard to exhibiting, which merits commendation. He regards local shows with chief favour, holding that he grows the flowers first for his own pleasure, and, in the next place, for the gratification of his neighbours, hence his exhibits are mostly found in the shows at Kingston, Ted-

effort, so that what plants are done are done well. Amongst the reflexed varieties, Mr. Coombs shows with special satisfaction, *W. Earley*, of a rich reddish-rose colour, which he regards with special favour. *Madlle. Madeline Tesier*, *Cullingfordii*, *King of Crimson*, *Amy Furze*, the *Christines*, and others are all in capital form.

The best *Anemones* expanded were *Jeanne Marty*, *Grande Alvéole*, *Nelson*, *Annie Low*—a primrose-coloured sport from *Lady Margaret*; also that variety and others. Of incurved flowers, that excellent white *Mrs. Heale*, was very fine in form and substance. Good also was the dark-coloured *Refulgence*, and the golden-buff *Barbara*; very fine were the new sport variety *Alfred Lyne*, the new French variety *M. A. Brahaut*, and *Mrs. Coleman*, and *Violet Tomlin*, one of the handsomest incurved.

In the favourite Japanese section the varieties

keeping the stock by taking cuttings during the month of October. They will succeed very well with the same kind of treatment as that usually afforded the bedding Calceolarias—i.e., the cuttings may be planted in a border, sheltered from the east and north, and covered with a hand-light, or they may be planted in boxes, and be placed in a cold frame, or they may be planted out in the frame. If severe frost sets in, the frame should be banked up with cocoa-fibre refuse, and mats or litter placed on the glass. The frame where our Calceolarias and Pentstemons were wintered last season was so treated, and they passed safely through the winter, although the temperature fell nearly to zero, and low temperature continued for many weeks. This was a sure test of their capabilities of endurance. The garden varieties of *P. gentianoides* are useful for producing flowers during October and early November, and their varied colours give an interest to the garden at this late period of the year. Pentstemons seed freely, and unless the capsules are removed, the plants soon cease to flower; but by their careful removal, flowering goes on into the winter if the weather is mild.

THE GARDEN AND FORCING PINK.

Readers of the *Gardeners' Chronicle* will remember that I have urged the importance of planting out the laced Pinks as early as the first or second week in September, so that the roots may get a firm hold of the soil. All varieties of the Pink are so perfectly hardy, that there is no need for storing any of them in pots; moreover, I have noticed that if any of the plants should die in the beds during the winter, and they have to be replaced with plants wintered in pots in the spring, these plants seldom produced as well-laced flowers as did the permanent occupants of the bed. It is necessary to stir the surface of the beds in dry weather, and make firm any plants loosened or thrown up by frosts. The plants have a prettier effect when in flower if they are not planted too wide apart, 8 or 9 inches asunder is a sufficient distance; larger plants put out earlier in the season may be from 10 inches to 1 foot asunder at the outside.

Pinks grown to force for early bloom are as much garden Pinks as any others we have, and succeed equally well out-of-doors; but many garden Pinks cannot be classed as forcing Pinks, because the flowers are generally out of character when forced, and none of the laced Pinks flower in their true character when forced. The best varieties for forcing are the white ones. The old fringed white, grown in the fields about here, is a useful and very pretty variety. It is able to withstand rough treatment, and produces masses of flowers, which are never so double as to force the calyx open. The prettiest variety for pot culture is Lady Blanche, the flowers of pure white, and of exquisite form; but I fancy it has become too delicate to produce the large masses required for the production of a good head of bloom. I have not grown it for several years. The new one, raised by Hooper, of Bath, and named Her Majesty, will be a valuable variety if it force well, and in that event it should take the place of the older ones. By putting in the cuttings of these under glass early in the year, as I have frequently advised, and planting them out in good soil, they form big clumps, and should be potted up in October or early this month. They may be placed in an airy frame until they are required for the forcing-house. *Jas. Douglas.*

NURSERY NOTES.

CHRYSANTHEMUMS AT ST. JOHN'S NURSERY, PUTNEY.

MR. STEVENS is well known as a large grower of Chrysanthemums, not only for exhibition in plant groups, but also for market; hence his quantities are considerable. Thus we see at his place large clumps, as it were, of such effective varieties as Mr. W. Holmes, E. Molyneux, Elaine, Sunflower, Amy

Furze, Source d'Or, and others, which are so striking as to suggest the desirability of inviting groups of a dozen plants of one sort only at shows, as in that way a very fine result is obtained. Damp has done much harm to many of the earlier flowers of some varieties, whilst others suffer nothing. The chief show-house is 80 feet by 25 feet, enabling a very fine display to be made, but the roof is too low and the ventilation imperfect; hence, largely, the damping complained of. Still there are plants enough to form twenty such groups as Mr. Stevens puts up at the Royal Aquarium, and which invariably take a good place in the competition.

Of Japanese, very fine and abundant, are Mons. Bernard, a rich dark magenta-coloured flower, of great beauty; W. H. Lincoln, a fine, broad, incurved, rich yellow variety; Edouard Audiguier, rich crimson; Maiden's Blush, very fine; Avalanche, Stanstead White, E. Molyneux, a beautiful Japanese Anemone; M. C. Lebosqz, primrose-buff; Sunflower, in grand form, and blooming freely on cut-back plants; Etoile de Lyon, Criterion, &c. Beyond those previously named as good for market, are William Stevens, Miss Stevens, Gorgeous, Mons. Lemoine, and for later cutting Albel, Golden Ethel, Golden Gem, Mrs. H. J. Jones, and that very dwarf late variety, Princess Blanche, Mr. Stevens specially recommends for market cutting. There are some three or four large houses crammed full with plants to furnish cut flowers, and the supply it is evident will be well maintained until Christmas. There are also in the collection some good incurved flowers, notably Princess of Wales, on one plant of which is also one bloom of Mrs. Heale, so pure white is the sport. Mrs. Coleman, Miss Haggas, Violet Tomlin, John Doughty, Sarah Owen, and Antonelli are a few of the many excellent incurved sorts here. Few blooms are grown to exhibit on show boards. All are shown on the plants, with the exception perhaps of a few for a special purpose. Growers for market do not care to grow flowers, which, after being cut and exhibited, are of little further value. It certainly looks at present as if Mr. Stevens would not put up one of the least meritorious of the Chrysanthemum plant groups at the coming show of the National Society.

CAMBERWELL NURSERY.

MR. NORMAN DAVIS, at Camberwell, has a high reputation as a provider of first-class Chrysanthemum novelties, and enjoys, further, the distinction of being enabled to show how possible it is to grow an extensive trade collection of Chrysanthemums well in the densely populated district of South London. His plants also differ materially from those generally found in the public parks and other show places, because he propagates so late as March and April; hence his plants are dwarfer, not one exceeding 4 feet in height; and as we look over the large collection which fills the very fine light span-house of some 60 feet by 25 feet at Camberwell, it is easy to see every bloom below the eye-line. As one result of the late propagating, generally the blooms are later, but the plants ranging from 2 to 4 feet are so stout and well-foliaged that they could hardly be excelled. Really grand on these late-struck plants are blooms of Vivian Morel. What a grand reflexed flower this is! quite putting into the shade altogether that flat coarse flower, Etoile de Lyon. Louis Bohmer is promising some good flowers, although Mr. Davis thinks the centre of this variety hard to expand. If so, that will affect its exhibition value. Of varieties less known yet, Miss Annie Hartsborn, white incurved Japanese; Mrs. Frank Clinton, yellow incurved; Elliot F. Sheppard, straw-yellow ribbon petal; Mrs. Walters, rich deep crimson, sport from E. Audiguier; Caesar Costa, like E. Molyneux, but has shorter petals; Bouquet de Dames, white, short stout petals, very free and robust; Florence Davis, after Meg Merrilies style, tulle flower; W. H. Lincoln, beautiful yellow, very dwarf, robust and free; and Gloire de Rocher, rich reddish-chestnut, are all admirable varieties. Of course, the collection includes most of the older sorts, but these need not here be particularised. Of

incurved forms beyond the now almost common M. A. Brahaat is May Tomlin, a deep rosy-lilac sport from Princess of Wales, which will doubtless be a welcome addition to this section. The pretty Barbara is largely grown, and promises to produce many beautiful flowers. Of new reflexed forms, Marquise de Clapiers, of a rich pink colour, promises to make a fine variety. Princess Blanche, very dwarf and late, is, perhaps, the best pure white incurved to grow for Christmas cutting. The plants run about 2 feet in height.

Of Pompons, of which there is a very large collection, Miss Bateman, reddish buff; Helène, amaranth; St. Michael, rich yellow; Cendrillon, rosy-pink; Miss Wheeler, William Westlake, Maid of Kent, and Blanche Douglas, were all excellent. Of single Pompons, exceedingly pretty were Miss Rose, pink, very free, and carrying a charming head of bloom; Mary Anderson, white; Terra-Cotta, reddish-buff; Mrs. Langtry, and Jane, the pretty white Japanese Pompon.

FRANKWELL NURSERIES, SHREWSBURY.

THESE are pleasantly situated on the outskirts of the ancient and very picturesque town of Shrewsbury, and are owned by Messrs. Pritchard & Sons. Both the grounds and glasshouses have been considerably extended during recent years; indeed, at the present time there are two large span-roofed houses being completed for the growth of Tea Roses and Tomatos. The latter are growing in pots, with single stems, the shoots and leaves being kept well thinned and stopped; the plants being very healthy, and carrying heavy crops of good clean fruits of Hathaway's Excelsior type. The houses contain a remarkably well-grown lot of decorative plants in great variety, and a portion of which, covering about 40 yards of staging in one of the large tents at the recent grand show of the Shropshire Floral and Horticultural Society, and capitally arranged, showed to great advantage, and were greatly admired. Amongst them was a batch of *Lilium auratum* growing in $4\frac{1}{2}$ -inch pots, with spikes about 2½ feet high, having six or seven large flowers each, and a profusion of clean foliage. I also noticed a fine batch of seedling plants of *Grevillea robusta*, growing in 48-pots, which were very pictures of health. These light, erect-growing plants, with their Fern-like foliage, are very telling when judiciously intermixed with variegated and bright-foliaged and flowering plants. Mention may also be made of large batches and good assortments of Pelargoniums and tuberous-rooted Begonias, which made quite a fine display in one of the houses.

The nursery grounds cover an area of about 12 acres, and occupy an elevated situation, from which charming and extensive views (eastward and northward) over the town of Shrewsbury and the landscape beyond, are obtained. Northward is Hawkstone, the beautiful seat of Lord Hill, and three miles eastward is Sundorne Castle, and the "Wrekin," a beautifully wooded hill, near Wellington, about 10 miles distant, with occasional glimpses of the Severa winding its course through the fertile Shropshire valleys within a few hundred yards of Messrs. Pritchard's nursery.

Trees of every description growing in such a high and exposed situation necessarily make a sturdy growth, and transplant well. The stock of Apple and Pear trees is very promising, being clean, and many of them bearing good crops for their size, of clean, bright fruit. Golden Holly, Yews, Cupressus, Juniperus, and other coniferous trees, bear evidence of being in congenial soil, and of being well looked after in their various stages of growth; the same remark applies to the quantities of white Arums, Spiræas, &c., planted out in trenches, &c., for putting up this month for winter and spring flowering. *Visitor.*

THE CULTURE OF ALPINE PLANTS.

(Continued from p. 481.)

THERE is just one thing more which I ought to notice while I am speaking of the utility of pockets which are on the level, or only on a gentle decline.

It is very helpful to some alpine plants during the scorching months of the year to give them a thick coating of cocoa-fibre. *Gentiana verna* e.g., is all the better for it at once, and will begin to run. *Ranunculus pyrenaica* responds with great acclamation, and in my part of the world a good mulching-substance is an exceptionally useful ally in defeating the rays of the sun. But the power to avail oneself of it entirely depends on the way in which the rockery has been built.

There is an immense satisfaction in the process of consulting for the wishes of one's plants, and in getting them to feel at home in one's hands. This only can be done by incessant experimentation, but the efforts bring their own reward along with them. "Consider how they grow," are words with which we are all familiar, and they are of a very intensive description, and I submit that it is only

On the other hand, the strangest surprises sometimes happen, and these in the right way. *Ranunculus parnassifolius* was sent to me some time ago, and partly because I was busy at the time, and partly because I did not in the least know what to do with it as I had failed so often before, I planted it at haphazard, I might almost say, and never thought of seeing it again. But this time it is doing wonderfully well, and there must be some lesson to be learnt there, for its prosperity is against, and not because of, the instructions I had received with regard to it.

Last year I came across a delightful little alpine *Morisia hypogaea*—in the Jardin d'Acclimatation at Geneva. M. Correvon had got it from the mountains of Sardinia, and he was loud in its praise. Of course, such a gem could not be left unnoticed; but I remember thinking at the time that the chances were largely against its doing well under an English

ceased, as a rule, to give exceptional trouble, and the memory of their former behaviour is no small reason for welcoming them under better conditions.

Of course, as I have said before, all this is not meant to imply that the method I have described is the only one to be taken; nor do I, even for a moment, go so far as to assert, that it is the best way. I do not believe in any wonderful nostrum or specific for growing plants. There is no *elixir vite* for alpinists. I wish to limit myself strictly to an answer to the question put by the Editor to me, and to tell his readers what I have done, whether it be right, or whether it be wrong. A writer of a very interesting letter to the *Guardian*, a few weeks ago, under the initials, "M. H. M.," about the culture of alpinists, animadverted strongly on "bell-glasses, wooden or woven screens, labels, and other devices." He might almost have had my garden in his mind, and have

FIG. 71.—*TILIA PUNGENS*, VAR. *ARGENTEA*: A HARDY EVERGREEN; COLOUR, SILVERY BLUE. (SEE P. 517.)

in line with them to disbelieve in any wholesale proceedings, and to try to individualise our flowers. Sometimes it must be allowed that experiments fail altogether, and when one still believes that there should be success, it does not seem to be attainable. I have entirely failed to establish *Pulmonaria maritima* in my garden, though I have tried it over and over again, and yet it is a thing to be done, for I saw it myself in Mr. Wood's garden at Kirkstall, and he has no trouble about it. I never can induce *Pyxidanthera barbulata* to stay with me any length of time. I had it again this year, but it was all in vain, whereas a few years ago I came across it in Sir W. Bowman's garden in Surrey, and it was as happy as could be, and now it is very happy at Kew. I never once have been able to carry *Primula Reidi* through the winter on my rockery, though I have minutely followed the directions of those who seem to have done so, but I do not despair.

sky. This fear has, however, by no means been borne out by the result. With much of trepidation about it, I planted my little acquisition in the most suitable place I could find on my rockery, and I consulted for its wishes as best I could do it. Instead of failure, there has been the greatest success, and this experiment has, at any rate, answered in an unexpected degree.

But all this keeps up the excitement, if I may so say, and it is a legitimate and proper excitement, which the cultivation of alpinists affords. Moreover, there is the very highest reward in having plants on the rockery which are now quite docile and doing well, but which once were heartbreaking in the extreme. I would not on any account be without *Pulmonaria dahnrica* if I could help it. It now does quite well, but it used to fail utterly with me, and so it is also with very many other things. Many *Primulae*, once very bewildering, have now

meant to condemn it, and he recommended a very wholesale way of doing things, which he said was sufficient to ensure good effects. He may be perfectly right, from his own point of view, in everything he said, but I noticed one ominous sentence at the beginning of his communication, which ran thus: "If a plant dies, die it must." Those few words are sufficient to show that his point of view is not my point of view, and we aim at very different things. If "M. H. M.," whoever he may be, can throw light upon the cultivation of really difficult alpine plants, I should like to pull my rockery to pieces, from the top to the bottom, and to imitate him; but, at present, I do not see that it is so. It seems to me that they must be individualised in our hands, and no general treatment will do for them all. I agree with him when he says, "Nothing to my mind is uglier than a rockery;" but I have noticed that there is a sort of compensation for the

criticisms which mine has called lorth—and it is this which consoles me. At first, my friends used to exclaim, in wonderment, "What in the world are you doing?" Afterwards, the words ran thus—"It does not look quite so bad as it did last year;" in a little time they thought it seemed beginning to be pretty in some parts; then the perforated wall was actually admired, and I expect that in a couple of years from now, when the plants have grown properly over it, and have become more established, and they are clearly showing their distinctive habits of growth, not a few of my visitors will be so bold as to declare about the rockery itself and its multifarious occupants, "we admire it greatly;" in other words, the moral which I should deduce from my experience is this—take care of the plants; do the very best that can be done for them, and the rockery will take care of itself. *H. E., Ryde.*

THE APIARY.

GRANULATED HONEY.

Owing to the low temperature, honey granulated early this season. It is scarcely advisable to offer it for sale in this condition, and the best way to bring it back to its former consistency is to stand the bottles or vessel containing it in a slow oven after first taking off the covering. If there is any danger of the oven getting so hot as to bring the honey to boiling point, the door should be left open, as a higher temperature than about 190° would impair its flavour. The uninitiated generally seem to have the idea that granulated honey has been brought to that state by mixing flour with the genuine article instead of its being a perfectly natural process, and therefore a proof of pureness, and for this reason it is an excellent plan to affix an explanatory label to bottles intended for sale. Honey sometimes granulates in very coarse grains, and according to the authority of *Le Bulletin Apicole*, a French bee journal, if this honey is melted in a water-bath and then exposed to cold, it will afterwards granulate very fine. The same paper also states that honey can be made to granulate by churning it, as is done with cream to obtain butter, a few days after it has been extracted, and that this process causes a very fine grain.

In order to prevent sections granulating, they should be kept in a dry place at a temperature as near 60° as possible, and a cupboard next a fire-place would be very suitable for the purpose.

NEW APPLIANCES.

Two inventions likely to be heard of in the future were submitted for the inspection of bee-keepers present at the quarterly *conversazione* of the British Beekeeper's Association on October 21. One was an automatic smoker invented by M. Layens, a French beekeeper. It has a clockwork mechanism which has the effect of fanning the burning fuel, and the amount of smoke emitted can be regulated by means of a break. It can be set down without any fear of its being out at the moment required, as it holds enough fuel to last for a long time. It is made in Switzerland, but the price of 11s. 6d. is rather a drawback. The other invention is what may be termed an automatic swarm liver. This arrangement, on which is placed an empty skep, is put in front of a hive expected to swarm. The queen, not being able to get out, ascends into the skep, where the bees find her out, and cluster, and are then removed and hived in the ordinary way. It met with the general approval of the bee-keepers at the meeting, and the appliance-makers present signified their intention of making them for sale. *Expert.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

CATLEYA HOUSE.—Our house is very gay with *Catleyas*, gayer than was at one time possible, and *Cypripediums* may differ as to which of the autumn-

flowering ones is the true *C. labiata*. Many amateurs would undoubtedly be glad to have the pretty *Catleya Percivaliana* in flower at the end of the year; but unless the plants are very strong, and the growths have been matured at an early period, and few plants in this collection were sufficiently ripened to take in hand this year, no good results will follow. Suitable plants being selected, they should be placed in the lightest and warmest part of the house, and no water afforded till the first days in December, when the flower spikes will be easily seen making their way in the sheath. I would recommend those who may have a good supply of flower spikes on white *Lælia anceps* to put them in a position facing south, and may so train the spikes that the flowers can be seen in front or much of their beauty will be lost. Those who have but a small collection of these plants should buy *L. a. Schroderiana*, it being by far the best of the section, the grand *L. a. Dawsoni* not excepted. I am glad to hear from many sources that these varieties are flowering generally, but it seems to be an undoubted fact that *L. a. Sanderiana* is much freer to flower than the others. I have been asked if there is any difference in the treatment required to bloom the others; I can but tell those who may be in doubt that our plants bloom freely with the treatment which I have advised in these columns.

Catleya exoniensis will not be found in a flowering condition in many collections at this date, but where rich colour and good quality are required, I think nothing that I have yet seen will compare with it except a few varieties of *C. Hardyana*. Like many other things, *C. exoniensis* should be bought in flower, for though all are beautiful some are much finer than others. Day's variety is perhaps the best. Early in the year I recommended the breaking up of large old plants of *Cælogyne cristata*, and the placing of them into pans hanging to the rafters after the new pseudobulbs were completed, which may now be done. If a long season of bloom is looked for from *Cælogynes*, some of them may be placed in the intermediate-house, keeping them dry, or nearly so, to prevent the decay of the pseudobulbs. Others should be placed in the warmest division, but little water must be applied in any case, or the flower spikes now pushing up will turn black. The temperatures of the various houses may remain as advised in the previous calendar, and if any alteration be made, it should not be more than 2°, and that downwards. *A. G. Catt, Parkfield, Hallow.*

PLANTS AND THEIR CULTURE.

THE COOL CONSERVATORY.—There is no lack of flowering subjects wherewith to keep this structure gay for some time to come, as the *Primula sinensis* early sown are in full bloom, and will require care in applying water at the root; zonal *Pelargoniums*, *Eupatoriums* in variety, and *Bouvardias* which have been grown in pots all the season. Those *Eupatoriums* and *Bouvardias* which were lifted from beds where they had grown during the summer, have not been affected in the least by their removal to pots, and at the present time are flowering abundantly. *Heliotropes*, now very useful, are always prized on account of their fragrance, and these, with the late-flowering *Fuchsias*, early-flowering *Ericas*, Roman *Hyalanthus*, and *Chrysanthems*, will enable a display of bloom to be maintained till the end of the year. The watering of plants should at this season be performed in the early morning, so that floors, stages, and paths may become dry again before night-fall. Decayed leaves and blooms should be removed from the plants before they become unsightly, and the pots, tubs, and every part of the structure kept scrupulously clean. The temperature at night may range from 50° to 55°, and by day 10° higher, admitting air by day on every favourable occasion.

LACHENALIAS.—These plants should be kept well up to the roof-glass, to prevent drawing of leaves, affording them plenty of air when the weather is favourable for doing so. A cool pit will be found a very suitable place for *Lachenalias*, or, failing this, they may be grown on a shelf near the glass, in a cool greenhouse. Now that these plants are starting into growth, an occasional watering with clear manure will be very beneficial in improving the colour and size of the foliage and blooms.

EPACRISSES will require special attention when affording water; my practice is to allow the plants to get fairly dry before watering, and then sufficient is afforded to thoroughly moisten the ball. *Epacris* may be had in bloom throughout the winter and spring months, if a proper selection of varieties be

made. A cool pit, from which frost can be excluded, is a suitable place in which to grow them, and should any be required to bloom early, a few of the earlier-flowering varieties may be brought into the greenhouse. *Epacris* differs but little as a whole in the time in which they flower. The latest are *variabilis*, *pulchella*, *miniata* and *m. splendens*, *impressa*, and *Butterfly*.

ERICAS.—*Erica hyemalis*, *E. Willmoreana*, *E. melanthera*, *E. gracilis*, *E. vernalis*, &c., will now be found very useful for furnishing purposes, and, considering the ease with which they may be grown, should make them more popular than they are. *Ericas* may be bloomed in a low pit, such as would suit *Epacris*, admitting plenty of air at all times when the weather is not frosty. By this time the pots will be found well filled with roots, and care must be taken that the soil does not become dry, or the flowering shoots will become permanently injured, and perhaps the plant will not recover. *R. Milner, Penrice Castle, Swansea.*

THE FLOWER GARDEN.

NOISETTE ROSES.—The following are excellent garden varieties:—*Aimée Vibert*, pure white, small blooms in clusters; *Celine Forestier*, bright yellow, highly fragrant, and free growing, the opening buds useful for button-holes and bouquets; *Cloth of Gold*, pale yellow, with deeper centre, large and vigorous; *Madame Caroline Kuster*, beautiful orange-yellow, large and globular, and of vigorous growth; *Madame Massot*, white blooms in large clusters; *William Allen Richardson*, orange-yellow, flowers small, and best as buds. All the *Roses* in this and the Tea-scented sections are best when grown against a south or a west wall or fence, the shoots being laid in about 4 inches apart.

SINGLE ROSES.—Single *Roses* are decoratively valuable in the flower garden or shrubbery in masses or otherwise. The flowers of various shades of colour, ranging from the white Japanese *Rosa rugosa-alba* to that of the Copper-coloured Austrian Briar, are effective for making bouquets and filling vases. The following are distinct:—*R. berberifolia Hardii*, single yellow, with maroon; *Camellia japonica*, pure white flower, with yellowish stamens; Copper Austrian Briar, nankeen-yellow, very distinct; *Macartney simplex*, large single white, with shining evergreen leaves; *rugosa*, a very handsome species, which grows about 3 feet in height, and produces a quantity of carmine-crimson flowers, and bunches of large coral red berries, that remain on the plant all the winter if pheasants do not eat them; *rugosa alba* is a white variety of the last-named.

TEA-SCENTED ROSES.—The Teas named in this list have a fairly hardy constitution, and they are good bloomers; *Belle Lyonnaise*, deep canary-yellow, tinged with salmon, large and full—a seedling from *Gloire de Dijon*; *Catherine Mermet*, delicate flesh-coloured rose, large and full, fine form, and a fine Rose for training under glass-roof in a greenhouse; *Comtesse de Nadaillac*, apricot-yellow, fine globular shape and double, vigorous grower; *Devoniensis*, creamy-white, tinted rose, large; *Etoile de Lyon*, sulphur-yellow, with bright yellow centre, large and full; *Gloire de Dijon*, buff, orange centre, very large, fine strong grower, and a popular Rose; *Isabella Sprunt*, sulphur-yellow, free bloomer [Not good everywhere, Eo.]; *Letty Coles*, beautiful pink, of good form and free habit; *Madame Falcot*, rich orange-yellow, nice in bud or half-opened; *Maréchal Niel*, the blooms being large, full, globular in shape, and of deep yellow, and the shoots clothed with large shining leaves; *Niphotos*, pale lemon, often white, with fine Magnolia-like petals, blooms large and full, very nice in bud. The climbing variety of this Rose, introduced by Messrs. Keynes, Williams & Co., of Salisbury, is admirably adapted for growing under glass or against a warm aspect in southern shires. *Rose Marie Henriette* is a red *Gloire de Dijon*, and has the good properties of that favourite Rose.

AYRSHIRE ROSES.—These make compact bushes, and are well adapted for planting, either singly on lawns or in shrubbery borders. They bloom freely and the flowers are small, of white, rose, and other colours. The varieties I should recommend are:—*Alice Gray*, *Dundee Rambler* (*Myrrh-scented*), *Queen of the Belgians*, *Ruga*, very sweet; and *Splendens* (*Myrrh-scented*).

WINTERING PLANTS OF ECHEVERIA SECUNDA GLAUCA.—These succulent, useful, and very effective

carpet-bedding plants, where growing in high and dry situations, are quite hardy in the south, but in other parts, as well as in low, damp places in the south, it is necessary to take them up, remove the offsets, sort into different sizes, and then pack them close together in shallow boxes, working a little light soil about the rooted stems when doing so; water them, and place the boxes in an orchard-house, cold pit, or frame, where, with a slight covering in frosty weather, they will be quite safe. The old plants, if they are wanted, may be stored away in like manner, but cutting off an inch or two of the old stems. *H. W. Ward, Longford Castle, Salisbury.*

FRUITS UNDER GLASS.

MELONS.—A high temperature must be kept in the Melon pits to finish the fruits; and but little moisture afforded at the root, air being admitted by upper ventilators whenever it may safely be given, that is, in very mild weather. Disused Melon pits are usually occupied with plants in the winter, so that when a start is made in the new year with Melon growing, much cleaning is required to make them fit for the work. All painting, &c., should be finished at an early date, the young plants not liking air about them which is contaminated with the fumes of fresh paint; moreover, if dung and leaves are employed for affording heat, the paint soon gets discoloured if it be not thoroughly hardened by long exposure.

SOILS AND MANURES FOR FRUITS.—Now is the time to collect and stack soils for next season's use. I prefer the plan sanctioned by long usage, of placing layers of manure between the layers of turf, especially if the soil is infertile or sandy. As is well-known, the surface-soil of a sheep-run or deer pasture if loamy makes the best materials for Vines, Pines, Melons, &c.; but it is not always to be obtained by the gardener, and means must be taken to enrich the poorer materials which he has. Melons like a heavy soil; and Vines do best in fibrous loam neither too light nor too clayey.

SELECTING FRUIT TREES, POTTING AND PLANTING.—If any additions to the trees in the fruit-house are contemplated, no time should be lost in selecting the trees if they are to be bought in, as it is well known that the earlier purchasers have the finest choice, and as the nurserymen despatch their orders in rotation, those ordered early can be planted before the hard weather sets in, whereas late ordering means late planting with all its disadvantages. Vines for planting, when not home-grown, should be bought soon, choosing those with short-jointed, round, and hard canes, in preference to flat, long-jointed ones, full of pith. Peach and Nectarine trees are now ready, and should be planted, and if the treatment afforded is a proper one they will feel no check. If any house-repairs require to be done, the new trees may be placed in an upright position in the open air until these are finished. Trees for pot-culture may be potted-up without delay now that the leaves have fallen. Plunge the pots to the rim in a border in the open, and they will be ready to take indoors when wanted. For forcing in pots, I prefer the older varieties of Peach, notwithstanding some of the new ones are larger. A few trees in pots of Hale's Early, Alexander, and Waterloo, will afford nice dishes; and if space can be given, those fine early Nectarines, Lord Napier, Early Orange, and Advance, they should be grown. When planting in borders, be careful to place the roots not further from the surface than 4 to 8 inches, to cut off all injured roots, and to mulch with half-decayed manure. *G. Wythes, Syon House, Brentford.*

THE HARDY FRUIT GARDEN.

PLANTING FRUIT TREES.—The present being the best month for planting, shifting, and regulating the fruit garden, work of this kind should at once be pushed on with vigour. Belonging to this section is the making of new borders and stations for wall trees and espaliers, draining land, and getting everything in a forward state for orchard planting. Remove much of the soil if fruit trees have stood on the location previously, at least for several yards round the site of the future tree, and replace it with sweet loam. The soil should not be made rich with manure, and this should be laid in most cases as a mulch over the roots; only soils that are much impoverished need manure to be dug in.

PEACHES, NECTARINES, ETC.—These fruit trees may be lifted and replanted, as well as Pears and bush fruits, at once; but it is almost too early to expect

fruit trees from the nurseries. In lifting large trees open a trench 5 to 7 feet away from the stem, and 2 feet deep, and remove the soil from about the roots with a fork, undermining them, and shaking out the soil; and when a good handful of roots is got out, wrap them in wet mats, sacks, &c., and so proceed till the whole of the roots have been liberated. The tree should have previously been detached from the wall, and held against it by a few strong ties, the stations being prepared, and the hole made 12 inches wider than the stretch of the roots. Carefully spread these out in all directions, and at various depths, pruning the wounded tips, and filling in amongst them with the finer particles of the soil; tread all firmly, if the soil be not wet, then level, and make smooth. In replanting, the stem should not be lower in the soil than just to cover the point of junction of the main roots with it. Lightly secure all the larger branches to the wall or fence, and afford a mulch.

Bushes of Gooseberry, Currant, &c., may now be planted. In planting, care should be taken to keep early separated from late varieties, and not to mix up Currants with Gooseberries, the protection of the fruits from birds being rendered more convenient. *H. Markham, Mereworth Castle, Maidstone.*

THE KITCHEN GARDEN.

BROCCOLI.—The luxuriant growth made by Broccoli this season will make them an easy prey to frost; and when the latter threatens to be severe, protecting materials should be made use of, and the stems protected by it up to the leaves. In well-sheltered and naturally-warm gardens, a covering of bracken or litter put over the plants in frosty weather will suffice to protect from frost. Where the heads are already formed, as will be the case with the earliest varieties, the leaves should be tied together with matting over them, or the plants may be lifted and heeled-in in a cool shed or cellar. The practice of partially lifting Broccoli reduces the size of the heads, but as small as well as large heads are required this does not much matter. Autumn Giant Cauliflowers and the self-protecting Broccoli may be lifted when a fair-sized head is formed. This partial lifting of the early varieties is done by the workman commencing with the end plant in a row, and taking out a spadeful of earth on the north side, say at 6 inches from the stem, pressing the plant over towards that point with the foot, and then putting the spadeful of soil dug from behind the next one over the stem of the preceding one, and so on through the entire row. Later varieties are better if inclined to the south. The plants should lean over at an angle of 40°, or thereabouts, with the level of the land.

TURNIPS.—White Turnips should now be stored, after the tops are removed, in a cool cellar, or in small heaps in the open, and covered with soil. Chirk Castle Blackstone, is a variety that keeps plump and firm longer than any other variety I know of.

FORCING GROUND.—Where early-forced vegetables are required, forcing should begin early this month, and heaps of tree leaves and stable manure be thrown together for forming hotbeds, not much dung being employed for beds requiring a mild steady heat.

Seakale and Rhubarb, if forced by dung and leaves out-of-doors, should have these materials placed over the stools in a warm state about the third week of the month. Before placing the pots or boxes on the stools, remove all leaves from around the crowns, and put a small heap of fine coal ashes, mixed with a little soot and lime added, over each. Let all materials used for this purpose be well mixed together, and got into a uniformly warm condition before using. See that the lids of the forcing pits fit close, or the ammoniacal steam may rot the crowns; and do not forget to place trial sticks here and there in the beds, or to examine these once or twice a week. At this season the warmth may reach 85°.

CHICORY AND DANDELION will be useful for salads now that Lettuces are getting scarcer, and roots of these plants in sufficient numbers should be put into a Mushroom house or other suitable place to sprout. *C. J. Waite, Glenhurst, Essex.*

PLANT PORTRAITS.

ACROSTICUM TOSAENSE.—A new Japanese species, described and figured in the *Japanese Botanical Magazine*.

ANTHURIUM RIDOLFIANUM × **ALBUM**, *Bulletin della R. Soc. Toscana di Orticultura*, August.

APHELANDRA TETRAGONA var. **IMPERIALIS**. A stove shrub with stalked, ovate acuminate leaves, and dense spikes of red flowers. *Gartenflora*, t. 1354.

ASPER SHORTI, *Garden and Forest*, October 7.

BEGONIA MDLLE, **EMILIE RODIGAS**.—A tuberous variety with flat erect flowers, of a circular form and deep red colour, nearly 7 inches across. Raised by MM. BLANQUAERT and VERMEIREN, of Ghent. *Illustration Horticole*, t. 137.

BOLTONIA ASTEROIDES, *Meehan's Monthly*, September.

CALADIUM SACITTATUM.—A Brazilian importation of M. LINDEN'S, characterised by its very narrow sagittate leaves, deep green, with the central and two basal nerves marked out with a broad irregular stripe of red. *Illustration Horticole*, t. 138.

CORYANTHUS LEUCOCORYS, *Rolfe*.—A Peruvian species, of extraordinary size and appearance. *Lindenia*, t. 293.

DENDROBIUM HIBIBUM, *Orchidophile*, July.

DENDROBIUM SUPERBIENS, *Rehb. f.*—An Australian species, with rose-lilac flowers, and undulated segments. *Lindenia*, t. 294.

DIACRYLUM BICORNUTUM, *Lindenia*, t. 296.

DIANTHUS CALLIZONUS, *Garden*, October 10.

ECHINOCACTUS PECTINATUS ROBUSTUS, *Westnik, St. Petersburg*, October.

ERIOGONUM HAUSSKNECHTI—A curious little species from Mount Hood, in Washington Territory. The leaves are spatulate acute, and from the centre of the tuft upriser a stalk bearing a globular head of yellow flowers. *Gartenflora*, 1891, p. 493.

FICUS STIPULATA, *Revue Horticole*, October 1. Dimorphic form, with fruit as figured in the *Gardeners' Chronicle*.

HAMAMELIS JAPONICA, *Revue Horticole*, October 16.

IRIS ROBINSONIANA, *Garden*, October 3.

LILIA AMANDA, probably a natural hybrid, perhaps between *Cattleya intermedia* and *Lilia crista* or *L. lobata*. *Illustration Horticole*, t. 135.

LILIUM AURATUM CRUENTUM.—A magnificent variety in the way of *L. Parkmanni* as to colour, having on each petal a broad central band of deep crimson, and numerous spots of the same colour. Grown by M. Ed. Pynaert. *Revue de l'Horticulture Belge*.

LOBELIA SYRITICA, *Revue de l'Horticulture Belge*, October. Perennial, dwarf purple flowers.

LONICERA TATARICA, var. **GRANDIBRACTEATA**.—A form in which the usually minute bracts are replaced by two shortly-stalked leaves. *Gartenflora*, 1891, p. 457.

MASDEVALLIA CORISCEA, *Lindenia*, t. 295.

MORISIA HYPOGAEA, *Garden*, September 12.—Dwarf crucifer for rockery, with sinuate leaves and yellow flowers.

NOTHOLYNA OVALBATA, *Meehan's Monthly*, t. 1.

ODONTOGLOSSUM CRISPUM, var. **BLUTHIANA**.—A form in which all the segments are deeply flushed with lilac. *Gartenflora*, t. 1356.

ORPHANOGESIA GUALTHERIOIDES, *Gartenflora*, September 1, 1891, p. 469.

PEAR CHARLES COGNÉE, *Gartenflora*, t. 1357, October 15.

PEAR DOYENNE D'HIVER, *Westnik, St. Petersburg*, October.

PHILADELPHUS MICROPHYLLUS, *Garden*, September 26. An elegant hardy shrub, small in flower as well as in leaf.

PRIMULA IMPERIALIS, *Garden*, September 19.—A tall species with tints of yellow flowers. It has been long waited for, but scarcely justifies expectations.

PRIMULA POISSONI, *Garden*, October 17.

ROSE QUEEN NATALIE OF SERBIA, *Rosenzeitung*, n. 5, 1891.

QUERCUS PONTICA, *Gartenflora*, p. 512, October, 1891.

SIENANDRUM LINDENI, a stove plant with oblong dark green leaves with transverse yellow nerves. The plant is a Peruvian Acanthad, described by Mr. N. E. Brown in *Illustration Horticole*, t. 136.

STREPTOCARPUS ELWENSIS ×, *Illustration Horticole*, August 15.

STREPTOCARPUS WATSONI ×, *Illustration Horticole*, August 15.

TILLANDSIA BIEROGYPHICA.—Leaves oblong, strap-shaped, entire, with irregular transverse bars, flowers yellow in a panicle. *Revue Horticole*, September 1.

TILLIUM GRANDIFLORUM, *Garden*, September 5.

TULIPA KOLPAKOWSKYANA, and **T. LEICHTLINII**, *Garden*, August 22.

VIBURNUM MOLLE, *Moller's Lantsch Gartner-Zeitung*, Aug. 10.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Nov. 10. Royal Horticultural Society: all Committees meet.

SHOWS

MONDAY, Nov. 9.—St. Neots.

TUESDAY, Nov. 10. National Chrysanthemum Society, Royal Aquarium, Westminster (three days). Kingston-on-Thames Horticultural Society (two days). East Grinstead. Leeds Paxton Society, Horsham. South London.

WEDNESDAY, Nov. 11. Croydon (two days). Birmingham. Northampton. Torquay.

THURSDAY, Nov. 12. Bourne mouth. Bath (two days). Tiverton. Cirencester (two days). Reading. Swansea.

FRIDAY, Nov. 13. Eastbourne (two days). Chichester (two days). Oxford, Durdley (two days). Chelmsford and Essex. Teddington, Wimbledon.

FRIDAY, Nov. 13. Devon and Exeter. Hitchin and District, Cheshunt.

SALES.

MONDAY, Nov. 9.—Dutch Bulbs at Stevens' Rooms

TUESDAY, Nov. 10. Dutch Bulbs at Stevens' Rooms. Dutch Bulbs and Libum anatum at Protheroe & Morris' Rooms.

WEDNESDAY, Nov. 11. Dutch Bulbs, at Stevens' Rooms. Clearance of Greenhouse Plants at Dorset Cottage, Fulham, by Protheroe & Morris.

THURSDAY, Nov. 12. Dutch Bulbs, at Protheroe & Morris' Rooms. Importation of *Cattleya labiata*, &c., at Stevens' Rooms.

FRIDAY, Nov. 13. Established and Imported Orchids, at Protheroe & Morris' Rooms.

SATURDAY, Nov. 14. Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—43°·1.

At a meeting held at the Cannon Street Hotel, on Friday last, Sir JAMES WHITEHEAD in the chair, it was determined to hold a great Fruit Show to last for some ten days, in London next autumn. The chairman began by inviting the co-opera-

tion of all horticultural societies, indicated a site on the Thames Embankment as most suitable for the purpose, and as one which he thought could be obtained, at no cost, from the corporation, and further showed his sincerity in the matter by offering £500 towards a Guarantee Fund. This was afterwards augmented by Mr. SMEE and by others. The matter is, therefore, started in a business-like manner. A proposal to exclude foreign fruit, and to make the exhibition exclusively national, was very generally condemned as unwise. The only source of friction, so far as we can see, is in the question of co-operation. Is this to be as the great International of 1866 was, a private enterprise? Is the Royal Horticultural Society to repeat the error it then made, or is it willing to take the lead, so far as technical matters are concerned, leaving the financial business to be undertaken by the City magnates, or by whomsoever may have the power of the purse. It is obvious, that in spite of the great revival in the affairs of the Royal Horticultural Society, it has not the command of funds, but in the matter of brains, experience and specially in pure disinterestedness, it has greatly the advantage over any private enterprise.

History, past traditions, and, we are sorry to say loyalty, do not go for much in these times; we must look to the present. Consider what the Society has done of late years—what it is doing now! Look at its fruit garden, its Fruit Committee, and its fruit congresses! What has the Fruiterers' Company—till lately an obscure, if not effete body—done to command the sympathies of the horticulturists? Absolutely nothing, but get up a successful fruit show in the Guildhall last year. And yet we are asked to allow this body virtually to take the lead in a great national enterprise of this kind before, if we are correctly informed, the Royal Horticultural Society has even informally been consulted on the matter.

Ultimately, it was resolved, that a provisional committee be appointed to formulate a scheme, and to report thereon to a future meeting. And, it was further resolved, that the Royal Horticultural Society, the Fruiterers' Company, the Royal Agricultural Society, the British Fruit Growers' Association, the Gardeners' Company, and other horticultural societies, should be asked to co-operate in the movement. So far well; but the resolution went on to say, "One member from each of the above-mentioned societies, and one member of the corporation, and six other gentlemen, will constitute the provisional committee." Of these six, so far as we understood, five are to be nominated by the Chairman, Sir JAMES WHITEHEAD, the Master of the Fruiterers' Company. We sincerely trust we are mistaken in this, as we can hardly think the horticulturists desire to efface themselves in such a fashion even in favour of so courteous and able a chairman as Sir JAMES WHITEHEAD. But, after all, these are matters of detail. The great matter is, shall we have such a show or shall we not? The feeling of the meeting, as of that of the horticultural body at large, was, and unmistakeably is, in the affirmative. If the Royal Horticultural Society cannot or will not take the lead in the matter, then, as Sir JAMES WHITEHEAD said, "we shall be constrained to go on."

ARISTOLOCHIA GIGAS.—The large *Aristolochia* exhibited from Kew at a recent meeting of the Royal Horticultural Society, under the name of *Aristolochia grandiflora*, is one of the most remarkable plants in the Royal Gardens. It was quite new to the Society, though another species

of *Aristolochia* bearing the same name was not unknown to some of the members. The question of the accuracy of the name having arisen, it was considered desirable to investigate the matter, with the result that great confusion was found to exist in the synonymy of this and some of the allied species. The history of the plant is briefly as follows:—It was sent to the Horticultural Society from Guatemala by HARTWEG, about the year 1840, and in 1842 Dr. LINDLEY figured it in the *Botanical Register* (plate 60), under the name of *A. gigas*. In 1848 the same species flowered at Kew, where it was believed to have been raised from seeds sent from Jamaica by PURDIE, and Sir WILLIAM HOOKER figured it in the *Botanical Magazine* (plates 4368 and 4369). On the strength of this record, it would appear, HOOKER reduced it to *Aristolochia grandiflora* of SWARTZ, a common species in Jamaica. He also referred *A. cordiflora*, MUTIS, a native of New Grenada, to the same species, and he further mentions that his friend, Mr. MIERS, recognised it as a Brazilian species. DUCHARTRE (DC, *Prodr.*, xvi, i, p. 472) followed HOOKER, with the exception that he excluded *A. cordiflora*, which he described as having a tailless perianth. An examination of the West Indian *A. grandiflora* convinces me that it is a distinct species, from which, however, *A. tetens*, LINDLEY (*Bot. Reg.*, pl. 1824), does not materially differ. The two species, *grandiflora* and *gigas*, are very similar in foliage, but the flowers of the former are not more than a third the size of the latter, and quite different in shape, as is evident from the figures cited. The synonymy of the two species may be summarised thus:—1, *Aristolochia gigas*, LINDLEY, in *Bot. Reg.*, 1842, t. 60; *A. grandiflora*, HOOKER, in *Bot. Mag.*, t. 4368, 4369 (excluding synonyms), repeated in *Flore des Serres*, pl. 351 to 354; *Garden and Forest*, iii, p. 596 and 598, figs. 79 and 80, not *A. grandiflora*, SWARTZ. 2, *Aristolochia grandiflora*, SWARTZ, *Flora Indue Occidentalis*, iii, p. 1566; *Tussie Flore des Antilles*, i, p. 181 to 190, t. 27. GRISEBACH, *Flora of the British West Indian Islands*, p. 299, excl. syn. *A. gigas*, LINDL.; *A. tetens*, LINDLEY, in *Bot. Reg.*, t. 1824. DUCHARTRE (DC, *Prodr.*, xv, i, p. 475), treats *A. gigantea*, HOOKER, in *Bot. Mag.*, t. 4221 (not of MARTIUS, *Nov. Gen. et Sp.*, i, t. 48), as a variety of *A. grandiflora*, but I think it is a distinct species, though I am unable to clear up this point at present, as I can find no specimen of it in the Kew Herbarium. There are specimens in the Kew Herbarium of another allied *Aristolochia* "from a garden at Bonchurch, Isle of Wight," received through Messrs. VEITCH in 1837, and then named *A. grandiflora*, but the flowers differ from those of this species and from those of *A. gigas*. The dimensions of the Kew flower of *A. gigas*, exhibited at the Horticultural Society's meeting, were, roughly, 18 inches wide by 22 inches long, with a tail 34 inches long (fig. 75). In the case cited in the *Garden and Forest*, the dimensions of a flower are given as 12 by 18 inches, with a tail 42 inches long, though the plant now flowering at Kew was originally a cutting from that described and figured in *Garden and Forest*. *A. gigas* grows very rapidly, and flowers freely, the plant in the Victoria-house at Kew having borne over thirty flower-buds about seven weeks ago, when the first flower opened. Mr. WATSON informs me that *A. gigantea* of MUTIS is in cultivation in several gardens in England, but has not yet flowered. There are specimens of *A. gigas* in the Kew Herbarium from Guatemala, collected by HARTWEG, SKINNER, and SALVIN. *W. Botting Hemsley.*

THE ROYAL HORTICULTURAL SOCIETY.—The various committees will meet as usual on Tuesday, November 10, in the Drill Hall, Westminster. It will probably interest growers of Chrysanthemums to know that large money prizes and silver-gilt medals will be awarded to the most successful competitors, according to the society's schedule, copies of which may be obtained from the secretary, 117, Victoria Street, or from the superintendent, Chiswick Gardens, to whom all entries should be sent.

FIG. 75.—ARISTOLOCHIA GIGAS: CREAM-COLOURED, FLUSHED WITH ROSE; VEINS, PURPLE; THROAT, DEEP VELVETY BLACK. REDUCED BY TWO-THIRDS. (SEE P. 552.)

EDINBURGH CHRYSANTHEMUM SHOW.—The entries for the above, we are informed by Mr. R. LAIRD, the Secretary of the Society, will close on November 13.

NATIONAL CHRYSANTHEMUM SOCIETY'S CATALOGUE.—As several inquiries have recently been addressed to me, says Mr. C. HARMAN PAYNE, concerning a re-issue of our official catalogue, may I be allowed to say, through the medium of your paper, that it is not intended to publish a new edition this year, nor have the committee proposed to issue an appendix or supplement to the existing centenary edition, which, having been brought close up to date, will answer all practical purposes for the ensuing season.

THE LATE FRUIT SHOW AT EDINBURGH.—Mr. W. K. MUNRO, 16, Pitt Street, Edinburgh, has forwarded us a copy of a photograph representing the judges and members of the committee at the late great International Fruit Show in Edinburgh. Many will be glad to possess so interesting a memorial of so important a meeting.

THE ROYAL LANDSCAPE GARDENER.—The King of the BELGIANS has, as previously mentioned, been exercising his well-known love for horticulture and landscape gardening in the palace and grounds of Ciergnon. For ten years His Majesty has been planning and personally superintending alterations, which, until completed, he kept quite secret, wishing to give the Queen a pleasant surprise. Ciergnon Castle is erected on the site of a small hunting-lodge, used by the late LEOPOLD I., and now includes a fine and well-stocked conservatory, wherein, on pressing a button, a little electric light gleams out at the base of every plant. The grounds around the palace extend for 8 miles, sloping downwards from the chief entrance for some distance, and then rising sharply to a Pine-clad plateau. Although the river Lesse runs by the palace, the plantations in the park formerly suffered much from drought. To remedy this, the same engine which is employed for the electric light now pumps up the river-water into a large concreted reservoir. The tank is made ornamental as well as useful; little cascades, torrents, and streams have been arranged, and the ground around them so planted as to look as natural as possible; rustic bridges cross the water at convenient places, and many pretty vistas and peeps at the adjoining country have been opened out. All the alterations made have much enhanced the natural beauties of this favoured nook near the woods of the Ardennes, and say much for His Majesty's good taste and skill in landscape gardening.

ROYAL NETHERLANDS HORTICULTURAL SOCIETY.—The second National Chrysanthemum Exhibition will be held at Amsterdam (Damrak, near the Exchange) from November 12 to 16. The number of entries is 109, with twenty-six different competitions. It is said that the blooms and plants will be better than last year. At the same time there will be a Chrysanthemum *plébiscite*. The Editor of *Sempervirens* puts the following questions:—1. Name ten elegant and curious-shaped Chrysanthemums; 2. Name six Chrysanthemums which produce large flowers; 3. Name six Chrysanthemums of compact-growing habit and free-flowering; 4. Name six Chrysanthemums, high-growing varieties, and free-flowering; 5. Which are the six best Pompon-flowered Chrysanthemums; 6. Which are the four best Anemone-flowered Chrysanthemums; 7. (Specially interesting for nurserymen.) Name six of the best white Chrysanthemums for cutting purposes; 8. Name the six best yellow for the same purpose; 9. Name ten Chrysanthemums with different colours for cutting purposes. Printed forms may be had either at the show, or of the Editor of *Sempervirens* at Amsterdam. The result of the above *plébiscite* will probably be published in the *Gardeners' Chronicle*, J. K. Budd, Haarlem.

LINDEN'S SALE AT PROTHEROE AND MORRIS' ROOMS.—The expectation of seeing over 200 specimens of *Cattleya labiata vera* in flower brought together such a company that there was scarcely standing room. The plants made a grand show, and prices may be said to have ruled high. The plants of a supposed new form of *C. labiata*, named *majestica* looked good, and the best pieces fetched from five to eleven guineas. *Dendrobium leucolophotum* averaged three guineas, and the unflowered plants of *Cattleya labiata autumnalis* realized about the prices they have hitherto fetched, viz., for anything like quality, from thirty shillings to two guineas. Then came the plants of that variety in flower, and some of the earlier lots fetched twenty-eight, twenty-four, thirteen, and ten guineas, toning down towards the end to from three to five guineas, and even less where the varieties were not good. The best lots of the *Dendrobiums* from New Guinea brought two to six guineas, and a plant each of *Cypripedium Arthuri-anum* and *C. cœnanthum superbum* eight and a half guineas each. The *Mesospidium volcanicum grandiflorum* and the pretty *Cochlidoda Noezliana* also sold well, and the total amount came to something like £700.

A GIGANTIC CATTLEYA.—One of the largest *Cattleyas* ever imported is now in the nurseries of Messrs. SEEGER & TROPP, 112, Lordship Lane, East Dulwich, and, setting aside the value of such an enormous mass, the cost of its removal from the virgin forests of Venezuela, and carriage to its present home, must have taken a goodly sum of money. The plant in question is on the native wood as collected. It is in grand health, and of such proportions that the counting of its bulbs would be next to an impossibility. It is a *Cattleya Mossiæ*, the whole being made up of three varieties growing together, viz., the typical form, another larger and brighter coloured variety, and a third portion consisting of the valuable white petalled kind known as *C. Reineckiana*. The plant bids fair to flower well, and when in bloom it will be a grand sight.

VANDAS AT EAST DULWICH.—Vandas, and especially the forms of *V. suavis* and *V. tricolor*, are so often badly grown in gardens, that we are always glad to note their successful culture, as it proves that the plants are not difficult to grow, if but properly treated. In Messrs. SEEGER & TROPP'S Orchid Nursery, 112, Lordship Lane, E. Dulwich, there is a grand bank of these plants, comprising most of the best and rarest species and varieties. The secret here, as in other places where we have seen Vandas good, seems to be to keep them in a fairly low temperature, and in a house which is light, but not too bright with sunlight in summer; while the atmosphere in the house is carefully ventilated, to keep it as pure as possible at all seasons. The general collection of Orchids here improves steadily in good looks, and many very rare species and varieties are to be found in it, such as *Laelia Perrinii alba*, *Sobralia macrantha alba*, &c.

NURSERYMEN AND THE PARCEL POST.—In view of the increase at this season of post parcels of young plants, shrubs, and trees, a notice has been issued from the General Post Office suggesting the following methods of packing, the greatest length allowed being 3½ feet, or a length and girth combined of 6 feet:—Shrubs and dwarf trees should have the roots encased in bass matting, and the branches and twigs tied together with bass or string. Dwarf standard Rose trees should have bands of hay or of bass matting wound round their entire length. Wooden boxes should be used for flowers and soft or tender plants. The address label attached to such parcels should bear the words, "By parcel post, plants perishable." The rate of postage is 3d. for the first pound, and 1½d. per pound afterwards, up to the maximum of 11 lb.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—At a special meeting held by this society, a very interesting

and instructive paper was read by Mr. G. PAUL, of the Old Nurseries, Cheshunt, on "Fruit Culture on the West Slopes of the Lea Valley." Mr. PAUL'S remarks were illustrated by a very fine collection of fruit. The paper, which dealt particularly with the fruit-growing capabilities of the county of Herts, was greatly appreciated by the large number of the members and their friends who were present.

MR. OWEN THOMAS, on leaving Chatsworth, was the recipient of a very handsome plated ink-stand and pair of candlesticks from the gardeners employed under him, 60 in number, during seven and a half years.

THE GARDENERS' ORPHAN FUND.—The first meeting of the committee after the recess took place at the Hotel Windsor on Friday, October 30. Mr. JOHN LAING presiding in the absence of Mr. WILLIAM MARSHALL, the chairman. The Hon. Secretary, Mr. A. F. BARRON, announced the receipt of two donations of £5 each; and the following special contributions were also announced, viz., £2 2s. from the Bristol Chrysanthemum Society; £5 7s. 6d. collected by Mr. Wadde, the Gardens, Birdsall, York; and £11 7s. 2d. from various money-boxes. Mr. BARRON also announced that the total net proceeds of the late general collection was £250 2s. 1d. Mr. BARRON made the announcement that an influential district committee had been formed in Manchester, consisting of Mr. Bruce Findlay, Mr. R. Tait, of Messrs. Dickson, Brown & Tait; Mr. T. Robinson, of Messrs. Dickson & Robinson; Mr. W. Plants, Mr. E. Griffith Hughes, Mr. W. Elkin, and Mr. W. B. Upjohn, Worsley Hall Gardens, who will act as hon. secretary. Mr. Upjohn, by virtue of his office, becomes a member of the executive committee, and power was given to him, in the event of his being unable to attend the meetings of the executive committee in London, to delegate any other member of the Manchester committee to take his place. It was unanimously resolved to invite Alderman Sir JAMES WHITEHEAD, Bart., to preside on the occasion of the Annual Dinner of the Fund in February next.

FRUIT-GROWING AND MARKET-GARDENING AS IRISH INDUSTRIES.—Mr. W. H. (BULLOCK) HALL has printed, in the form of a pamphlet, the record of a recent trip to Ireland with Mr. RIVERS. It is well known that, through the liberality of Mr. HALL, suitable trees have been distributed in various districts of Ireland, especially in South Cork. The object of the visit was to see what progress had been made. We shall, on a future occasion, revert to the subject; but it may suffice to say now that, so far, the prospects are encouraging, and Mr. HALL'S wise beneficence is, in more senses than one, likely to be fruitful.

DAFFODILS.—Messrs. BARR & SON propose to offer for competition at the Royal Horticultural Society, medals of silver and bronze for Narcissi of all kinds, including Daffodils. The medals will be awarded at six meetings, from February to May. The details will be given subsequently. Suffice it to say, that they include prizes for forced Daffodils, new Daffodils, seedling Daffodils, and collections.

JAPANESE BOOKS.—Dr. RYŪKICHI YATANE, of Tokio, has issued the first part of a work, entitled, *Iconographia Floræ Japonicæ*, descriptions with figures of plants indigenous to Japan. It is published by Z. P. MARUYA & Co., of Tokio. Dr. YATANE, in his prefatory note, says that he intends to give figures and descriptions of all the plants known to be indigenous to Japan. The figures, moreover, will serve as illustrations to a compendious flora of Japan, by the same author. The undertaking is sufficiently formidable, but it has this great advantage, that should Dr. YATANE unfortunately be unable to carry out so vast a programme in its entirety, yet every item concluded has a distinct and independent value. The part before us contains twenty well-executed lithographic plates; the drawing is generally accurate, and the attention given to little points of detail connected with the

"habit" and mode of growth show that the artist has a well-trained eye. Among the plates is one of *Chrysanthemum sinense*, Sabine, var. *satsumensis*, Yatabe, a form growing wild in the province of Satsuma. [=C. *morifolium* var. *Hemslley* in *Gardeners' Chronicle*, November 23, 1889.] The text is in Japanese and English. *Phaius flavus* is also figured.—*Illustrations of the Flora of Japan* is a monthly publication edited by TOMITARŌ MAKINO, and published by KEIGYŌSHA, of Tokio. The illustrations are of a similar character to those mentioned in the preceding work, and are very creditable alike to the artist and the botanist. Tah. 48 represents another form of the wild *Chrysanthemum*, C. *sinense*, var. A. *sinense*, found abundantly at the foot of the mountains in the province of Tosa, Spikoku. [See Hemslley, *loc. cit.*] We may suggest in this case that the Latin names be placed on the plates, as well as the Japanese equivalents. Many native Orchids are figured, as *Sarcanthus scolopendrifolius*, *Oberonia japonica*, *Cirropetalum japonicum*, *Stigmatodactylus sikonianns*, &c.

THE ORIGINAL CHINESE PRIMROSE.—On several occasions we have adverted to the discovery of the original wild form in the mountains of Central China by Dr. HENRY and others. See *Gardeners' Chronicle*, November 23, 1889. We have also noted its introduction into this country where we first saw it in the gardens at Apley Towers, and subsequently with Messrs. SUTTON. Now we have received from Mr. EDMUND HYDE a flowering specimen. The calyx is tubular, cylindrical, scarcely at all distended, the sepals oblong, quite entire, free for about half their length. The corolla is 1½ inch (30 mm.) across, pale lilac, except at the throat, which is pale cream-coloured. The petals are obovate, and the anthers included. From such modest beginnings came the Chinese Primrose of our gardens.

SYRINGAS FOR FORCING.—The question has been asked in MÖLLER'S *Gärtner Zeitung*, which Lilac has the most enduring blooms when forced, S. *Marlyensis* or S. Charles X.? S. *Marlyensis* was said by importers of Paris blooms to be the best; but it is believed that there is no difference between them in that respect, and that the Paris gardeners employ S. *Marlyensis* for the excellent reasons that it will more readily force at an early period of the winter than others; and because the flower-spike is relatively small; and therefore well adapted for the florists' art; and moreover, when grown in darkness, the flowers are of a beautiful white or tender rose-colour. S. Charles X. is better adapted for late forcing, but its flower-spike is usually too large and full for bouquet work. It should be known that Lilac, of whatever variety, if it be forced early, or in great warmth, is never very enduring when cut; but from January onwards, if the flower-spikes are cut with a long piece of the matured shoot attached, and placed in a cool place, they would last at least from ten to fourteen days.

RUSSIAN APRICOTS.—However desirable the cultivation of the Apricot in the Orchard in this country appears to be, its success has hitherto been unattainable with such varieties as we possess. In the organ of the Royal and Imperial Horticultural Society of Steirmark (Styria), we read of two varieties of the Apricot which are cultivated in Central Russia, and are able to resist the intense cold of that region unprotected in any way. These are AUSTRIAN'S Large White and Small Late. As delineated, these fruits measure respectively, 1½ inch and 1¼ inch in their greatest diameter. They come almost true from seed, and are very prolific. These Apricots can be obtained from the National Arboretum, Zooschen, Merseburg, of which Dr. DIECK is the Director.

BOMBAY FERNERIES.—Mr. G. H. CARSTENSEN, Superintendent of the Municipal Gardens, Bombay, has published a paper on this subject read by him before the Bombay Natural History Society, and which contains interesting details as to the construction and maintenance of a fernery, and also some remarks on the conditions under which the

plants in question grow naturally in that part of India.

TASSO'S TREE, the famous Oak under which the great poet is supposed to have spent the greater part of the day during the last year of his life, when he had retired to the Convent of Sant Onofrio, was blown down during a violent gale recently. The tree, which all visitors to Rome used to visit, was kept standing by supports of masonry on all sides; but at last, notwithstanding all the care taken to preserve it, it has succumbed to old age. The trunk will, however, be kept as a relic in the Convent of Sant Onofrio.

DECAYED ELMS.—The stately Elms that line the terrace at Richmond are all internally rotten, and in a dangerous condition. Some must come down at once, and the rest, it is feared, cannot last much longer.

THE CONSTITUENTS OF THE FRUIT OF ILLICIUM ANISATUM.—What a wonderful lot of things a simple little seed like that of the Star anise, for instance, may contain. A German chemist, F. OSWALD, has recently found the following list of substances in this plant, to say nothing of other substances so well-known as to be unworthy of special mention:—Anchoil, safrole, quinol, ethyl ether, anisic acid, various terpenes, veratric acid, piperonal, cholesterol, protocatechaic acid, shikimic acid, phosphates, fatty and other glycerides. Sugar is not present in the fruit in any considerable quantity, hence its sweet taste is to be ascribed essentially to the presence of an ethereal oil. OSWALD'S paper is published in the *Archiv der Pharmacie*, vol. xxix., series 2, where it occupies some twenty pages.

TRAINS STOPPED BY INSECTS.—We have hitherto been rather inclined to regard the newspaper accounts of trains stopped by caterpillars as exaggerations, but investigation has proved that these tales were founded on fact. Near Luberton, North Carolina, the drainage and consequent improvement of once-swampy land is the cause assigned for a sudden and enormous increase in the number of Tent caterpillars (*Clisiocampa disstria*), which not only stripped the leaves from Oaks and Gums for 8 miles round, but collected on the railway line in such quantities as completely to stop a train. The wheels of the carriages went round as if the rails were greased, and the track was completely hidden by millions of caterpillars, of which so many were crushed, that the stench arising from them was described as unendurable. On another occasion, near Brighton Corners, New York, a similar stoppage to traffic was caused by enormous quantities of some water-beetle, thought to be *Belosstema*, *Dytiscus*, or *Hydrophilus*, and attracted to the spot by electric light. The line for a length of some 60 feet was covered with these creatures; the train could pass over them for but a little distance, yet the wheels crushed so many, as to cause a "number of loud, cracking noises like toy torpedos." Almost yearly, trains are stopped in various regions by insect pests, the army-worm, cotton-worm, tent-caterpillar, and certain species of locusts, being the usual offenders. The plants most frequently infested and destroyed are said to include species of the following genera:—*Quercus*, *Juglans*, *Fraxinus*, *Tilia*, *Rosa*, *Carya*, *Prunus*, *Acer*, *Cratægus*, *Fagus*, *Liquidambar*, and *Nyssa*. According to the report of the United States Department of Agriculture (*Insect Life*), the Gums and Oaks are the greatest sufferers.

SERVICE AND MEDLAR.—When dining with a friend in Worcester College, a trifling incident brought out one of his (Archbishop WHATELY'S) happiest *bon mots*. There were some Medlars on the table, and his host regretted that he had in vain tried to procure also some Services (*Pyrus domestica*), a fruit which grows wild in Kent and Sussex, and is there called "Checquers." One of the company asked the difference between a Service and a Medlar, to which Mr. WHATELY replied, "The same

kind of difference as that between "officium" and "officiosus."

LEGISLATION AGAINST INSECT PESTS.—In California the "horticultural interest of the State" is protected by an Act which requires that the Board of Horticultural Commissioners shall examine any fruit trees, vinerias, and nurseries which are supposed to be infected with insect pests. The Commissioners are further authorised to enforce the destruction of any injurious insects, their eggs, and larvæ, which they may find, as these are considered to be a public nuisance. Isolated cases of disease, if not summarily treated, frequently spread to all neighbouring plantations, when complete eradication becomes a difficult and often ruinous task.

"POPULAR GARDENING" AND THE "AMERICAN GARDEN."—An amalgamation between these journals is announced. In consequence, Professor BAILEY, the whilom editor of the *American Garden*, resigns his position, a distinct loss to progressive horticulture. The combined journals will henceforth be edited by Mr. ELIAS LONO, whose experimental garden enables him to speak with unusual authority. The publishing office will for the future be at Times Building, New York. We heartily wish all success to our American contemporary.

GISHURSTINE.—With returning winter, our welcome friend Gishurstine appears, to appease the gardener's dread of his peculiar maladies, rheumatism and the colds which follow on getting wet feet. We may safely say, that provided the boots or shoes are sound, a coating or two of the Gishurstine will render them impervious to damp.

COMMEMORATION TREES.—On Monday morning, November 2, their Royal Highnesses the Duke and Duchess of CONNAUGHT, on the termination of their visit to the Earl and Countess of RADNOR, at Longford Castle, near Salisbury, in the presence of other distinguished guests staying at the Castle, planted two trees of Cedar of Lebanon, on either side of an old Cedar which stands opposite the west front of the Castle, to commemorate their visit thereto.

NEW PUBLICATIONS.—*Garden-craft, Old and New*. By the late JOHN D. SEDDING. (KEGAN PAUL, TRENCH, TRUBNER & Co.) A notice will be given subsequently.

THE BULB GARDEN.

NERINE FOTHERGILLI MAJOR (CURVIFOLIA).

Of Cape bulbs none is more deserving of cultivation than the above, and it is surprising that the plant is seldom met with in private gardens, particularly where cool conservatories have to be gay, or choice flowers for cutting are in demand at this season of the year. Whatever may be the reason that this plant is not more grown, it cannot be that there are unsurmountable difficulties in its culture; for this is easy enough, provided suitable accommodation is at command, and a few simple points are attended to, and in the neglect of this lies the cause of some failures, *i.e.*, it sometimes happens that the non-success is due to codding the plant. The following cultural memoranda comprise the whole of our practice. We grow it chiefly for cutting, and during its season of flowering, when growth commences, it is kept on a stage near the glass, in a cool airy house; but when the scapes of flowers are removed, it is placed in a cool position upon shelves, close to the glass, and unshaded, so that they may get all the sunshine. Here they pass the growing season, with a free circulation of air, except when the weather is ungenial, and fire-heat only is afforded to exclude frost. Like some other Cape bulbs, the Nerine is impatient of a close wurm house, which causes its foliage to elongate, and the plant to get out of health. When the foliage dies away, and until flower-spikes appear, a place is found for the plants

on a bed of ashes in a cool dry but airy frame. During the resting period, from May until August, no water is afforded, the soil being allowed to get as dry as possible; and this condition, together with free exposure to air and sunshine, matures the bulbs and is most favourable to profuse flowering.

The ordinary course of watering the plants is followed whilst they are growing, and we find that well-rooted plants are benefited by moderate supplies of liquid manure. Frequent potting and large shifts do not suit Nerines. Indeed, this one grows best, and blossoms more freely, when it is pot-bound, and for this reason we are careful not to repot them oftener than once in two or three years, according to the condition of the plants; but top-dress when growth commences those which will not be repotted, the soil used being turfy loam, with a little sand mixed with it, but a very heavy loam should have a small portion of peat or leaf-soil added. *Thomas Coomber.*

THE CROWN IMPERIAL.

The late summer has not suited these plants, and bloom has been sparse and unsatisfactory in many places in consequence. In shallow soils and those naturally poor, the stations for this strong-feeding bulb should be dug out 2 or 3 feet wide and deep, and a good proportion of rich loam and coarse sand mixed with the staple. Above all, see that there is no stagnant water in the land.

The bulbs, either from the bulb dealer, or those which were formerly on the spot, may be planted forthwith, making the soil firm by treading it whilst dry previous to planting. Throw around each of the bulbs, which may be about 15 inches asunder, a handful of silver-sand, and make the soil firm about them. The depth to plant varies from 9 inches in very light, to 4 or 5 in heavy soil. Make a conical heap of coal-ashes or half-decayed leaves over each station, to keep out the frost.

NERINES.

Easy of cultivation as these bulbous plants are, they are seldom seen in gardens, and yet no plants are more worthy of culture. Years ago I grew them, but circumstances have interfered with my doing so for some time; and so rarely do I meet with them now, that on looking in recently at the Birmingham Botanical Gardens, I was pleased to see plants of *Nerine coruscaus* in bloom. It is a very pretty bulbous plant, with a truss of orange-scarlet blossoms. Other varieties are *flexuosa*, *Fothergilli*, *sarniensis*, and *crispa*. They do well with the treatment given to *Amaryllis*, and a 48-pot is quite large enough for them. *D.*

THE NEW CALIFORNIAN GLADIOLI.

A new strain, belonging to the *Gandavensis* section, has been raised in California, a strain that bids fair to make its mark in the annals of *Gladiolus* culture.

The *American Florist* thus describes this new departure: "Perfect in colour and markings. . . . nearly all colours of the largest of flowers so closely ranked that the flowers seem to be ranked in four rows on the stem; and, best of all, flowers to the stem of the cane, so close together as to give the extremity of the flower-stem a perfect cone of flowers, the petals entirely hiding the stem on all sides. The individual flowers are simply immense in size. We found numerous ones of many varieties 5½ inches from tip to tip of petals, with colours of every kind and marking known to the species."

To give an idea of colours, perhaps it would be well to pick out five descriptions of dwarf-growing varieties:—

No 1. Flowers closely packed all round the spike, like a *Hyacinth* (and are often double). Light cherry-rose in colour, striped lilac-crimson. An exquisite and striking variety.

No. 2. A lovely flower, large, open, and of unusual substance. It is of the purest white, striped and flaked with cherry-red. This is apt to vary, sometimes appearing almost pure white or cherry-red.

No. 3. Particularly attractive variety; flowers

dark flesh-pink, with a salmon sheen, streaked purplish-crimson, and sometimes with black; edges of petals charmingly tipped white.

No. 4 is a rich deep crimson.

No. 5. A striking variety, large open flower, varying from shrimp-pink to carmine; blazed and striped amaranth.

The raiser of this race intimates that, in producing this new strain, a million or more of seedlings have been raised, and a careful selection carried on for twelve years, the result being as before mentioned. It should be further added, that the petals are of much greater substance than the *Gandavensis* known to our English gardens, the Californian strain being distinguished by thick, stiff, nearly fleshy petals, which stand the Californian sun much better than the thin petals of our English kinds.

Whether this strain will withstand our changeable English climate has yet to be determined, but my impression is, that this race would prove of much value for conservatory decoration, and will doubtless meet with favour from amateurs who possess a glass-house, with little or no heat, and who are at a loss what to grow. Again, in the hands of decorators, and those gardeners who have to provide striking "changes" in the conservatories, &c., and who are at a loss for "something fresh," I fancy they have here valuable plants. *Pioneer.*

ON TREES AND SHRUBS IN LARGE TOWNS.

(Concluded from p. 514.)

2. *The selection of individual trees, &c.*—Anyone visiting a nursery with the view of purchasing will often meet with two styles of trees—the one with clean, straight vigorous shoots; the other with shoots of more compact and moderate growth. The former have been planted at considerable distances apart when in a young state and left to grow undisturbed for years, hence their vigorous appearance. They are the most tempting to the eye, but not really so good as the latter, which assume the less vigorous form, because they have been frequently transplanted from a young state. These latter are specially desirable for town planting. The conditions under which they have to live in the future are not over-favourable to growth and longevity, and it is always a harder task, even under the most favourable conditions, to transplant the former with success. The former will please the eye best when newly planted, but the latter will look and be the best at the end of the first year's growth and afterwards. And the cause of this is easily explained, even to those who have but a limited knowledge of tree-nature. A tree or shrub that has remained for a long time undisturbed in the same place pushes its main roots downwards to a great depth, and laterally to great distances, forming, as it does so, but few fibres. Now, in removing such a tree when sold, the roots are almost invariably shortened, and the chances of life and prosperous growth seriously diminished. But the frequently-transplanted tree has shorter main roots and more abundant fibres, all of which may be dug out with the tree, and replanted with it in its next home.

The question of how often should trees be transplanted in the nurseries to be safe for removal is sometimes asked, but it is not easy to give a precise and definite answer. Some trees, as the *Wellingtonia*, are best removed once yearly; others, as *Willows* and *Poplars*, will stand very well for four years, and there are intermediates cases; but none should be left undisturbed for more than four years. Here, in choosing the style of tree, a practical knowledge of gardening is almost indispensable, for it is not always easy for the uninitiated to feel sure of his ground. Anyone who has followed these remarks must see, on reflection, that the present mode of obtaining trees for new plantations is almost as bad as it can be. A list is prepared, names and heights given, and sent round to a certain number of nurserymen for prices. On their

return the prices are compared, and the lowest tender is usually accepted. This is the way to obtain the desired things for the least expenditure of money in the first instance. The articles are there by name, of the specified height, and of fair appearance. But the chances are—the process of cultivation for safe removal when sold, being a costly one—that the trees offered at the lowest price are of the least value, having been cultivated to sell rather than to prosper in the future. I have known many cases where plantations have been filled on this principle, and the owners have had the mortification of seeing numbers of subjects die off at once, and others drag on a miserable but short existence, which would not have been the case had they been frequently transplanted from their infancy upwards. It is a costly experiment to plant badly-prepared trees, however good-looking they may be, as the sum total of good ones is of small consideration in comparison with the total expenditure of what may be called cultural and collateral expenses. And then, what a loss of time and enjoyment are incurred in waiting for the bad trees to die before clearing them out and replacing them with good ones. I would here go so far as to say that a large tree may be removed with the same chances of success as a small one, provided it has been properly prepared for removal beforehand. The only qualifications of this remark are, the contingencies of a bad soil, an unfavourable season, or careless planting.

3. It now remains to speak of the planting and after-management of the trees:—

First, of Soils.—Soils are so various that it is impossible to particularise every one of them. If, however, we speak of loam, peat, chalk, clay, sand and gravel, we shall embrace the greater part.

Loam, in all its varieties, is a soil in which most trees and shrubs thrive well. It requires nothing more than loosening to the depth of 2 feet 6 inches, and enriching by the addition of manure, much or little, according to its natural poverty or richness. There may, however, be extreme cases in which the loam is so light, that it can be improved by the addition of clay or marl; or so heavy, that a portion of sand would be valuable.

Peat, if not wet or too sandy, will suffice for the prosperity of many trees and shrubs, and here manure and clay are valuable improvers. Many kinds of peat are precisely the thing for *Rhododendrons* and *Azaleas*, but we have found them thrive equally well in light fibrous loam. Wet peat bogs are a bad soil for most trees, because they are at once poor and sour, and are best improved by draining and exposure to the air for some months previous to the introduction of the trees, at which time manure may be added.

Clay should also be exposed to the air for some months before planting in it; if wet it should be drained, and enriched, and ameliorated by manure and sand, or old mortar, the *débris* of old brick buildings.

Chalk is not a bad subsoil, as it is cool, though poor; and if it comes within 2 feet 6 inches of the surface, it should be removed to that depth, and replaced with loam and manure. *Rhododendrons* abhor chalk, and should be kept from the influence of water containing its properties in solution.

Sand and Gravel are bad soils for trees, because poor and dry, and they should be removed to the depth of 2 feet 6 inches at the least, and replaced with loam and manure.

All soils that are wet should be drained, for few trees will thrive long if their roots are placed in stagnant water.

When preparing beds or borders for trees, the whole of the soil should be loosened by trenching to the depth of 2 feet 6 inches, and converted or improved where necessary on the above principles.

In planting single trees, it is a good plan to make what gardeners call "stations," to give them a good start in life. By a "station" is understood a square of ground, say, 3 feet in diameter, the soil of which is loosened to the same depth, and improved by the withdrawal or addition of materials if necessary, according to the suggestions already given.

If a good practical gardener is employed in planting, he wants no instructions from me or anyone else; but as this is not always the case, I will venture on a few remarks.

When planting trees, the roots should be carefully spread out, and fine mould settled between them before filling up the ground, which should afterwards be firmly trodden down above them. The careless and foolish practice of allowing the roots of trees, when planting, to be huddled together with their ends often turned upwards, instead of downwards, is often the cause of indifferent aftergrowth and premature decay. Trees should not be planted when the ground is soddened with water, lumpy, or sticky.

Large trees require staking, that the wind may not sway them to and fro, and hinder the formation of fresh rootlets. The tree-guard, too, is often a necessary adjunct as a protection against mischief or accidents.

For the first year after planting, trees and shrubs should be watered copiously, heads and roots, in dry weather, driving the water with moderate force upon the leaves, with the object of removing the impurities that will have settled on them. As time goes on, the pruning-knife will be called into requisition, to preserve the symmetry of the trees, and prevent an overgrowth that would interfere with the free-circulation of air, or prove an inconvenient obstruction of light. Nothing that I could say on this subject would be strictly applicable to the numerous individual cases which would continually arise. They must be weighed and decided on by the individual knowledge and good sense of an experienced practical gardener.

It may be thought that before concluding this paper, I should say something about the humbler denizens of the garden, the bulbs and flowering plants, which add so much to the beauty of our parks and recreation grounds. But this opens up a wide field, which can hardly be satisfactorily traversed within the limits of space at my disposal. I can only say that many bulbs and herbaceous plants are available here. By bulbs, I do not mean merely Hyacinths and Tulips, to which we have been long accustomed, but to many things, as Scillas, Narcissus, Iris, Gladioli, Crocuses, and Snowdrops, which would do well if planted in rich sandy soil.

One strong reason for the use of bulbs is, that they can be brought to their work in a prepared and efficient state, and can be renewed yearly where necessary. Perhaps there are but few instances in which they would prove satisfactory if allowed to remain to flower a second year, when the previous year's growth had been made under the trying influences of a town atmosphere. The same may be said of some bedding and herbaceous plants—they should be renewed annually. *Wm. Paul, Paul's Nurseries, Waltham Cross, Herts.*

HOME CORRESPONDENCE.

IRON v. WOOD IN GLASS-HOUSES.—This question still agitates the minds of some gardeners, notwithstanding the sifting the subject received some years ago in gardening journals. I know the general verdict of the gardeners was given against iron, and in favour of wood; but I personally, am not satisfied with that verdict, when it is viewed in the light of these latter days. In those days the sash-bars of iron houses were too close together, too heavy very often; were provided with no channels to carry off the water, that always will condense on iron in cold weather and during the night, and, so far as my knowledge goes, they were rarely galvanised. All these undoubted disadvantages of the iron house have now been got rid of, and in the system invented by Newton, of Hitchin, we find rolled steel used for the roof-bars, thus ensuring the utmost strength with the least possible dimensions; channels to avert drip; the non use of putty; and galvanising to take the place of paint—besides some minor "wrinkles" that are very convenient in practice. Houses built with these steel roofs are as air-tight as any plant-house needs to be, and practically imperishable; whilst owing to the reduction of the cross-section of the metal to the minimum, the radiation of heat—

that bogie of the older gardeners—exists no longer. And it was always a question that was not settled to my satisfaction, "if iron really allows the escape of more heat than glass itself?" The first cost of an iron-house is certainly greater than a wooden one, but this is greatly outweighed by the smallness of future repairs, and the non-necessity of paint, if the iron be galvanised. It would afford me much satisfaction to know what the readers of the *Gardeners' Chronicle* think of the matter. *One in Doubt.*

THE ORCHID COMMITTEE.—I do not think that the Royal Horticultural Society goes the right way to work to make itself popular with all classes of the community. Take, for example, the Orchid Committee. When a plant comes up for a Certificate, what happens? The members of the committee in favour of a Certificate are requested to hold up their hands; this, I contend, is a most unfair way of judging. The well-known firm of Messrs. A., having sold a plant to Mr. B., when the plant comes up for a Certificate, Mr. A., being on the committee, is obliged to hold up his hand, and others in the trade, although not thinking the plant worthy of first rank, are constrained to vote in its favour, otherwise their interests might suffer, were they not to do so. I am of opinion that the Committee should be composed of amateurs [it is largely so. Ed.], and that the judging should be by ballot. Under this system, to which no exception can, I think, be taken, it will be found that many who are under present circumstances unwilling to exhibit, will then do so, as it is a recognised saying that you must live close to London to have the merits of your plants publicly acknowledged. A friend of mine, well known in the world of horticulture for his writings and cultural skill, was asked and begged to come to London to read a paper on his mode of culture of a certain plant. This he at last consented to do, and at great personal inconvenience to himself, started for London. When he reached the place where he was to read his paper, only one member of the Council condescended to speak to him. He read it, and the secretary asked for, and got, his manuscript, and for which he was not even thanked. This is an example of the way many practical gardeners have been cold-shouldered by the Royal Horticultural Society, unless they happen to be within the charmed circle; and it is not the way either to extend the influence or usefulness of such a Society, which, whether the Council think so or not, is largely dependent on the reputation it bears in the estimation of practical cultivators for its success. *Justitia.* [We print this letter as expressing the opinion of many at a distance, who do not realise what the Society does. We think our correspondent has made a mistake in his signature. Ed.]

LILIUM OCHROLEUCUM. *Wallich*—At p. 526 of your recent issue, "J. M." writes:—"Wallich described his ochroleucum as 'dull yellow,' which admirably fits in with the colour of Mr. Baker's *Wallichianum superbum*." Will "J. M." be so kind as to give me the book and the page from which this quotation is made? I have not been able to find out that Wallich ever published any description of his ochroleucum. I know that he intended to do so, but I was not aware that this intention was ever carried out. As I said before, David Don published the plant as *Lilium nepalense*, and in his *Plante Asiaticae Rariores*, vol. iii., p. 67, Wallich adopted this name. The plant was gathered by Wallich's collectors in the mountains of Nepal, and there is no reason to suppose that he himself ever saw it alive. Sir Joseph Hooker is engaged at present in working out the Lilies for his *Flora of British India*, and we have drawings of three of the new Burmese Lilies ready for the *Botanical Magazine*. *J. G. Baker.*

ESTATE FRUIT NURSERIES.—Mr. Crump's advice, as given at Manchester, with respect to the establishment by landowners having large estates, of fruit tree nurseries, specially for the furnishing of trees to their tenantry, is good; but, I think, should be qualified so far that it would be best to purchase all such trees in the form of maidens from the trade, because that course would almost invariably ensure the securing of properly-worked trees, and the proper stocks. If it were resolved to raise stocks on an estate from Apple pips, these being very incorrectly termed crab stocks, all sorts of stocks would result, with the most irregular effect upon the future trees; in the same way, if unevenly selected, or unsuitable forms of dwarfing stock be used, the effect on the future of the trees is usually disastrous. I very much

doubt whether there could be found outside of nurseries, just the technical knowledge, born of wide experience, which nurseries alone afford. Few gardeners know one tittle concerning stocks and tree working, which those who have had long terms of service in fruit nurseries possess. No one would wish to see badly worked or inferior trees supplied to estate tenants, whether they be farmers or labourers. On the other hand, there seems to be no present means of solving the difficulty as to the furnishing tenants with trees to plant on other's land so satisfactorily as the landowner providing them, because every such tree planted adds something to the value of an estate. Probably few gardeners are in a better position to give good advice on this matter than Mr. Crump, because the plan advised has long been in operation at Madresfield Court. He and I would probably differ only in reference to the best place for the stock selecting and working of them, and if I incline to the trade nursery for such work, it is because what I have seen leads to that opinion. *A. D.*

DAHURICUS?—May I ask the meaning of the specific or varietal epithet *dahuricus*, which I find applied to several plants? I suppose it to be geographical, and in old atlases I find a name "Dauria," given to a district on the upper Amoor, to the east of Lake Baikal; but I can find no *Dauria* either in atlas or gazetteer. But my newest atlas, Bartholomew's, published in 1889, which has a list of 100,000 names of places and countries, gives no *Dauria* or *Dahuria*, either on the map or in the index. It is well, therefore, that an explanation of the word should be given now, or posterity may dispute about it, as some of us have recently been doing about Jerusalem. *C. W. Dod, Edge Hall, Malpas.*

JERUSALEM ARTICHOKE (pp. 482, 526).—Perhaps I ought to have replied to Mr. Dixon's remarks, but he seemed so determined to misunderstand what I wrote that I did not do so, and am quite contented that Mr. Wolley Dod should have done it for me. I may, however, be allowed to state that the Jerusalem Artichoke was never called *Girasole* in Italy, that the name was applied to a quite different plant, and that the derivation of Jerusalem from *Girasole* is a modern guess, which I unhesitatingly place among those "vulgar errors" in philology, which spring from basing derivations on similarity of sound. But I should like to ask what is the objection to "Jerusalem"? If it is that the plant does not come from there, Mr. Dixon must somehow explain away the other instance that Mr. Wolley Dod quotes (and there are more); he must explain the Star of Bethlehem, and he must refuse to eat turkey at Christmas till he has found out how an American bird is called a Turk. *Henry N. Flacombe, Bliton Vicarage, Gloucestershire.*

GOOSEBERRIES TRAINED ON WALLS.—Bare spaces between the permanent occupants of the wall might be planted with the Gooseberry, and it matters but little what the aspect may be, an eastern one will afford fruit fully a fortnight before that from the open quarter is ready. A western aspect affords a continuance of the supply of ripe fruit after all has been gathered from the open quarters; and plants standing on a northern aspect will supply the latest fruit—and indeed as late as October, if birds and wasps are kept from it. In a wet cool season the fruit from walls exceeds in flavour that from the open, and seldom do the berries split as is common on the latter. A capital variety for wall culture is the Warrington, which keeps a long time, and is of good quality, but not better in that respect than Champagne, which in spite of its small fruit is also well suited for the wall, in which position the flavour improves by keeping up to a certain period. The branches of Gooseberries should be trained upright, allowing a space of 3 inches between the bearing branches. Numerous growths will spring from the front of the main branches, and these should be cut off directly they are large enough. Summer pruning of Gooseberry trees on walls well repays the outlay incurred, and not only is it good for the fruit, but the trees are easily protected from the birds and wasps. *E. M.*

ONIONS.—The crops of Onions were badly milled in many places this year. Our Onions had a bad attack of it, but we managed to stay its progress by syringing them with pentasulphide of calcium and water, in the proportion of half a pint of the first-named to four gallons of the latter, which at once killed the mould. As the bulbs fast their tops early in the autumn, or had them so badly injured, the Onions did not grow to full size, and could not be

properly ripened, so that their keeping in store is doubtful, but much may be done to aid them in this by roping and hanging them in a cool dry shed where plenty of air passes through. The roping may be done by using short lengths of tarred or other string, or pieces of stick, to tie the tops of the bulbs to, using for this latter purpose matting or raffia, and then forming a loop at top wherewith to hang each lot up. Any which are without necks, or in the least unsound, should be laid out thinly for immediate use, and on no account ought any attempt be made to keep Onions in bulk, as sweating is caused, and decay soon sets in. *J. S., Ipswich.*

BRIGHT COLOURS IN TREE FOLIAGE—I should like to mention a case, which I noticed this autumn, which seems to exactly illustrate your contention, at p. 521, in the paragraph relating to colours in autumn foliage. There it is stated that injury to a branch will produce coloration in foliage even at mid-summer, thus showing that chemistry is not alone accountable for this autumn coloration. Quite early in October, passing along the Richmond Park Road, I noticed on a villa front the odd circumstance that *Ampelopsis Veitchii* was green as grass, literally, on one side of the front windows, and on the other showing the richest colour. I went across the road to examine this curious case, and found, not that there were two distinct plants, as I had at first assumed, the variation being due to diversity of character, as seedling raised, but that, whilst the main stems, which went up on either side of the lower window were of equal dimensions, the one carrying the coloured leafage showed in one place evidence of earlier injury, as the bark was visibly cankered. Both stems, however, came from the same root. That the injury to the stem had also checked growth was evident, as on the green side the branches covered one fourth more space than did those on the coloured side. Should anyone be dubious as to this fact, although probably few are sceptical, or be disposed to put the matter to the test, they can easily do so by injuring or ringing the bark on branches of the *Ampelopsis*, or of deciduous trees. It is evident that change in coloration proceeds first from subsidence in the flow of sap, and that changes which follow may be, to a certain extent, chemical. There is nothing in it, however, that is mysterious. What is much more difficult to understand is, as in the case of the Purple Beech, *Prunus Pissardii*, purple-leaved Maples, &c., the dark leaf coloration should be the product of rude health, and not of sickness unto death. *A. D.*

NEW PEA, SUPERABUNDANT.—I saw this new variety of Mr. Eckford's, in his seed grounds at Wem, during last August, and I feel sure it will be found to be a decided acquisition. In height it is about 2½ feet, and it is an immense cropper. The pods and seeds are in colour dark green, and the flavour is excellent. Several plants grown as single specimens, merely supported by sticks in the centre, were branched and bushy. *W. D.*

THE WEATHER IN MID-STAFFORDSHIRE.—The last month was one of the worst on record in this locality for outdoor pursuits, rain falling on twenty-two days. The second and third weeks give a rainfall of 2.04 and 2.41 inches respectively, with an almost total absence of sunshine. The rainfall for the month was 5.33 inches. On October 27 the wind veered to N.E., and has remained at that point with variations to east to the present time (November 2). On the 28th there were 4° of frost; on the 29th, 6°; and on the 30th, 8°. *John Wilkes, Creswell Hall Gardens, Stafford.*

THE PEOPLE AND PRIVATE GARDENS.—As the note on p. 343 says, it is pleasant to record the fact, that people living in and about towns appreciate the privilege of being allowed to walk around and see the gardens of the rich. Of this, I have a good deal of experience, as through the kindness of my employer many parties, large and small, have come here from Portsmouth, which is fifteen miles distant, and I do not remember an instance of misbehaviour, although on many occasions the persons have been mostly of the poorer classes. This good conduct of the visitors may, I think, be attributed to the freedom accorded them to go where they please, through the tempting fruit-houses, or amongst the flower beds, without let or hindrance. The visitors appreciate the trust that is placed in them, and form mutual protectors of the plants and fruits, &c., which they are allowed to behold. And should the grass be trodden down somewhat in certain parts, or a few loose stones get on to the turf,

or some heel-marks be made on the margins of the paths, a brush up, and the garden-roller, put all these little matters right in a short time. Many of our visitors say that they wish there were more possessors of gardens like Mr. Myers, who takes pleasure in showing the beauties of his garden to visitors from a distance. *E. Molyneux, Swanmore Park.*

THE AFRICAN OIL-PALM IN BORNEO.—I was much interested in your extracts relating to the cultivation of *Elais guineensis* at Pu'lo Daat, an island four or five miles off the British colony of Labuan. Being in Labuan in 1877 and 1878, I often saw the young Oil-Palms referred to at p. 423, these having been raised, as I believe, from seeds supplied from Kew, or through their colonial correspondents. The Hon. W. Hood-Treacher was at that date Acting-Governor or Administrator of Labuan, and having considerable interest in the Cocoa-nut oil industry established by his relation, Dr. Treacher, a former colonial surgeon of the colony on Daat Island, he was anxious to add a plantation of the African Oil-Palm to the great Oil-Palm of the East, *Cocos nucifera*. Pu'lo Daat is one of the largest of the seven or eight islands lying near Labuan, and off the Bornean coast. On it are very large Cocoa-nut plantations and rough oil-works, mainly worked by Chinese. The more hilly parts of the island in 1878 were covered by forest and jungle, which sheltered numerous wild pigs—animals which are about as mischievous and ravenous as goats, and a constant source of trouble to farmers and gardeners and settlers in the Malayan Archipelago; in some parts of the Malay Archipelago, indeed, organised pig-hunts are the rule at certain seasons, and the sport is quite as popular, and perhaps much more necessary, than are stag or fox-hunts nearer home. I was sorry to see by your extract on p. 423, that the flourishing little colony of African Oil-Palms had been removed, having had a slight personal interest in their success. Mr. Hood-Treacher and I had often talked over the pros and cons as to the success of this plant on Pu'lo Daat, and when the seedling plants were about 15 inches high, I accompanied him to the island in a boat, with some Malays and the first batch of young Palms. A large square patch of land, through which trickled a tiny stream, had been surrounded by a stockade to keep out nocturnal marauding of the pigs, and here we, with the help of the native boatman and a Chinaman or two, had holes dug, and the first Palms were planted with our own hands. The stream was dammed, and the plants were well watered in from a dip-hole, and then the young plants were shaded from the scorching sun with branches from the jungle. I shall never forget how the sun poured down upon us, and how soon our white clothes became a mass of wet and dirty rags on our aching backs; but the first batch were got in, and later visits were cheered by their leafy exuberance and vigour, and so we felt rewarded for the blistered state of our hands and subsequent loss of cuticle. There was a good Palm-leaf or Atap-thatched residence on the island, and my boatmen often ran in shore there for water and vegetables on our journeys to and from the mainland of Borneo itself, so that I now and then rested there, after having had a rough time in the forests beyond. If this should meet the eye of the Hon. W. Hood-Treacher, now one of H. M. Residents in Perak, I hope he will tell us why no attempts were made to utilise the produce of these African Oil-Palms. Of course, in all comparatively new countries, it is difficult to manage and market the produce of any new commodity. In Borneo, Sago and Cocoa-nut oil are staple products, the production and marketing of which are well known to both the native Malays and the Chinese settlers; but, as stated at p. 424, there is no market for African Palm-oil at the great eastern part of Singapore, and it may be that there are also technical difficulties as to the extraction and preparation of the oil itself, not easily and readily acquired by those to whom the preparation of Sago or of Cocoa-nut oil is easy and remunerative. *F. W. Burbidge.*

LATHYRUS SATIVUS.—The fact that this pretty blue-flowered annual Pea has recently been distributed under the name of *Lathyrus ceruleus*, as if it were a new species, is interesting because out of one hundred who might grow it, perhaps not a dozen would remember it as an old inhabitant of our gardens. It is known in seed catalogues as *L. azureus*, or Lord Anson's Pea, and it is so plentifully produced in Germany that a pound weight of seed can be had for a very small sum. It grows to the height of from 3 to 4 feet, and, like other species,

attaches itself to branches, &c., for support. The leaves are small and grassy-like, the flowers solitary and abundant, smaller than those of the common Pea, and of a bright azure blue colour—such a tint of bright sky blue as is rarely found in annuals. Alas! like others of the tribe, the flowers burn when fully expanded, and soon lose their beauty. The seeds are large, brown, angular, and much indented. It finds a place among the leguminous plants grown for fodder, and is still largely cultivated for this purpose in France, Germany, and elsewhere, and that notwithstanding pernicious qualities have been assigned to it by Duvernoy, and others, as causing rigidity of the limbs, delirium, and other injurious effects, and, it is said, to such an extent that its use was prohibited by an Edict of George, Duke of Wurtemberg, in 1671, which was confirmed and enforced by his successors. There is a variety known as the white-flowered Chickling, Veitch, which differs from the type in nothing except in the colours of its flowers and seeds, which are white, and the foliage is also a slight shade lighter in colour. Our methods of cultivating *L. sativus* are not of a nature to show off the delightful tint of blue found in the flowers to the best advantage. It is sown in the border thickly, the plants make a spare growth, put forth a few blossoms, no attention is given to them, and it proves disappointing. Now, let anyone treat it as a biennial and sow seeds, say, in August, grow the plants on in pots, and plant out in warm and sheltered spots in October, leaving the plants to the mercies of winter. It is quite hardy and generally stands well. Let them cultivate the plant, giving it due attention and good soil; and in spring and early summer they will reap a wonderful harvest of fine and brilliantly-coloured blossoms. The attempt is certainly worth making—let me assure your readers of that. *R. D.*

POTATO BLIGHT PREVENTION.—The inability to credit anything new being of use seems to infect everyone connected with the soil. The gentleman who wrote the article upon the trial of the above at Reading seems to have taken the complaint badly, and has allowed himself to be convinced that the Bouillie Bordelaise is injurious upon most insufficient data. I would point out one fact, and that is, that Suttons' experiment with the mixture was not an elaborate one, practically one strength of mixture (2 per cent.) being used three times upon Potatoes in one spot, cultivated one way, on the same soil, and exposed to the climatic influence of one place. It is true it was applied to 278 varieties of Potatoes, but one mistake in the preparation or application of the mixture would vitiate the whole experiment, and I think no sane individual would call the application of one strength of solution a large affair. No recommendation has ever been issued by the Board of Agriculture, so that the experiment was not carried out as directed by them as stated by the press. The following experiments were made upon Potatoes cultivated by fourteen different farmers, and the mixture applied by six different men; in the case of those of Mr. Cobb's, and of 2 acres of my own, by the ordinary labourer, and in my opinion far outweigh the single experiment at Reading. The six 2-acre plots of the Royal Agricultural Society of England at Sittingbourne, Cardington, Isle of Axholme, South Wales, Devonshire, and Lancashire, dressed three times with a 2 per cent. solution, the first time between June 29 and July 13, and second, between July 15 and July 27, were not damaged in the bine by mixture. Plots at Cardington and South Wales both show a large increase per acre over undressed Potatoes. The owners of the Potatoes at the former place write me—"We are well satisfied with the utility of the Bordeaux Mixture." Nine acres of Regents at Sittingbourne, next to plot of the Royal Agricultural Society of England (same sort), were dressed by Mr. Cobb twice with 2 per cent. mixture. I saw the 11 acres on September 21. They were then green and growing—not a leaf damaged. Regents' bine untreated, and those dressed with 1½ per cent. adjoining, all killed down by disease long before. The cultivation on this farm is of the highest character, fish and yard-dung being most liberally used. At Bewdley, Worcestershire, Mr. Thomas Harley applied 3 per cent. of mixture to Pince, Maincrop, and Early Puritan at end of August; not the suspicion of damage to the bine, but Potatoes do not appear bettered by the treatment as far as withstanding the blight is concerned. This land is liberally treated. Mr. H. Chancellor, of Chessington Hall, Surbiton, put 2 per cent. of mixture on Beauty of Hebron, and 4 per cent. once on Jeannie

Deans (on August 5). I saw them on August 29; Hebrons were ripening off, bine of same variety all round killed by disease; the Jeannie Deans a grand green, same variety by the side, dead; in this instance mixture put on with ordinary syringe, and not a leaf injured by it. Both sorts have been dug, and show increase of some tons per acre for treatment. Land rather heavy clay, well and intelligently cultivated; Potatos dunged with moss-litter; Hebrons not fresh seed; Jeannie Deans from Scotland this year. Mr. H. Chancellor tried various other fungicides, but without success. At Deeping St. Nicholas, Spalding, on July 3, I applied 2 per cent. of mixture to Puritans, Myatts, Internationals, White Beauty, King of the Russets, Sharpe's Victor, Monarch (about twenty-one sorts in all), on my trial-ground of 3 acres, many of them being those that Messrs. Suttons' report shows were injured at Reading. Same date, I used same mixture upon 1½ square rod of Maincrop, in middle of 8-acre field; on August 1, 3 per cent. of solution was again applied. A plot of Early Puritan on same farm, dressed once with 2 per cent. and twice with 3 per cent. had double crop without disease; of same sort adjoining, which were half bad. In lot 2, bine of Maincrops were still green, and double crop of rest of field, which was killed down some time before. In digging the tubers on trial-ground, I found that in the case of some of the varieties, especially Internationals, the mixture had failed to protect all the tubers, but with each sort the crop was double on those treated, which is not surprising, as bine kept green for over a month after that untreated had died down. At Spalding, no damage done to a leaf by mixture. Soil medium black land, well cultivated by owner, Mr. G. C. Healey, who understands Potatos; manure on trial-ground, half a ton cheap super. to acre. Maincrops and Puritans on dung. The Myatts were from Cambridge, Maincrops from Cheshire; most of other sorts were from Kent—a change not calculated to make them grow stronger. The Puritans last mentioned were not fresh seed, were planted on soil that had been planted with the tuber in 1888, 1889, and 1890. In the last year the whole crop, same variety, was lost by blight; in addition, the spot is under trees, and wet. Upon my trial-ground, at Cliffe, Rochester, Kent, I applied a 3 per cent. mixture on July 18 and August 24, to two plots, upon ends of an oblong piece of Potatos—ten varieties: First and Best, Windsor Castle, Nonsuch, Hebrons, White, White Elephant, Sutton's Seedling, and others. On August 24, I found intervening rows killed by disease, bine of one plot rather spotted with disease, the other only slightly so; second dressing saved latter entirely, and it ripened beautifully, but the bine of others died off with disease in places; crop much increased, and not a leaf damaged. Soil, a strong loam, dunged last year (for Potatos); this year, bone-meal, phosphatic guano, and nitrate of potash. Seed came from Herefordshire, and some my own saving. On September 5, in order to ascertain cost of applying mixture in the field, I had 2 acres of Reading Giant dressed by ordinary labourer with 3 per cent. mixture. They were planted on June 18, especially to try effect of mixture applied late once only. I intended to have had it put on about August 24, but was short of labour, so that bine was rather more spotted than I liked; but mixture kept it green three weeks' longer than variety undressed. 260 gallons put on the 2 acres; time, two and a quarter days, going longest way to work. From the acre covered by myself in half a day, it would have taken me one day and a half. In this case no damage to bine, except where mixture was prepared by man from my written directions, and about half an acre of bine seriously damaged by me when I applied it. Soil, medium loam, out of cultivation; no manure for seventeen years, taken to experiment upon with manures for Potatos, seed from Surrey. Crop, two tons, all sorts to acre. No difference apparently, one way or other, resulted from putting on Bouillie Bordelaise, or it was too slight to notice. Crop smaller where bine damaged in slight degree. On September 11, on Mr. Park's farm at Brunstane, near Edinburgh, and upon Mr. Simpson's farm, at Portobello, I applied the mixture to some Regents, Maincrop, and Abundance upon the former, and to some Abundance on the latter, in the presence of Mr. Young of the *North British Agriculturist*, whom I have to thank for assisting me in my efforts to try the solution. On the 15th, on my trial ground upon Mr. Duncan's farm at Carnoustie, I dressed some Reading Giants, Harperfield Regents, Shah, and other sorts; and on the 16th, on Mr. Cowe's farm of Balhousie, Carnoustie,

Arbroath, I put it on some Imperators. Mixture used in north, 1 lb. copper, 1 lb. lime, to 26 pints of water. All the farms were cultivated in the very highest way. On those near Edinburgh, large quantities of dung are used; at Balhousie, dung and a special mixture of Mr. Cowe's. Trial ground Potatos were on dung, placed in the rows. Not a single leaf was harmed, although my friends write it has done no good to the crop as far as they can see. Object to see effect in Scotland of one strong dressing once disease had appeared. The printed summary you quote does not give the reader the proper proportion, as there are 601 rows planted with varieties that are injured, and only 209 to which it was beneficial. The loss would have been 6 cwt. 1 qr. 14 lb. had they been equal. I do not agree with a line of the report. From my experience, it is early and second-early varieties that will pay best to dress as regards increased crop, and certainly all good quality Potatos like Abundance. I have a letter this week from the largest Potato merchant in Scotland to say that a 40-acre field of Abundance, near Dunbar, had a fine 14-ton crop to the acre. When I was worth it was half bad, yet with the Bordeaux Mixture I would plant it for a main crop. It is the best quality cropping tuber ever sent out from Reading from a farmer's point of view. As long as we must have crops to pay, so long shall we suffer badly with disease, even in the case of the so-called disease-resisters. A mixture that will only cost about 25s. an acre to secure the crop will pay even with them, as it will enable them to ripen. Thousands of tons of Magnums are cooking like soap at the present moment, simply because the bine was destroyed by blight before they were ripe; that want of quality makes over £1 per ton difference to the grower, if the soil is good quality soil. I have just sold Potatos at 60s. per ton that would have made 90s. had they not been cut down by disease; as they were my own, I speak feelingly. The machine used in all the experiments narrated was Vermorel's Eclair Vaporiser, except at Chessington. The R. A. S. E. put 75 gallons to an acre on first application, 100 gallons on second. I believe at Reading, 160 gallons was applied each time to the acre. In my experiment I noticed that with bine 3 feet high I used mixture at the rate of 220 gallons to the acre; on second application just before bine closed in rows, but consider I probably put on too much in my anxiety to thoroughly cover it. I think as little as 50 gallons per acre on first application would be sufficient with some sorts, and 100 on second, but quantity would depend entirely upon cultivation, variety, climate, time, &c., so no definite quantity can be stated to meet all cases. I did not find it a fertilizer, and never expected it was. It simply increases the crop by protecting the haulm, thus allowing the tuber to develop. Experiments made have proved that the spores of the fungus will not grow on leaf protected by copper. It is far from any wish of mine to desire to minimise the efforts the firm have made to inform the farming world of the effects of the Bordeaux Mixture. What I want every Potato grower to do is, to simply consider the facts I have placed before him, and not say it is no use trying that copper mixture, it is a failure at Reading, so can be no good. Try it, and you will report the same as W. Whitehead Cousins. [We have other correspondence to the same effect, but which the pressure upon our space does not permit us to print at present. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 27.—Present: D. Morris, Esq., in the chair; Dr. Hugo Müller, Professor A. H. Church, Rev. W. Wilks, Dr. F. Oliver, Mr. McLachlan, Mr. F. D. Michael, and Dr. Masters.

Primula Mould.—Mr. Masee reported upon a specimen submitted to him for examination from Mr. Wolley Dod. The mould in question is *Ramularia primulae*. It has occurred in various parts of Europe, but is believed not to have been previously recorded from Great Britain.

Water Plant.—The capsules sent by Mr. Barr from Constantinople were ascertained to be those of *Iris pseudacorus*.

Pear Spot.—Mr. Hinds sent a Pear with irregular depressions on the surface, corresponding to a black patch of decay within, and probably of fungus origin.

The condition is familiar to Pear growers in the case of certain varieties, but little is known of the inducing causes. It was referred to the mycologists at Kew for further examination and report.

Wallflowers with Clubbed Roots.—Specimens were exhibited in which the roots presented a similar appearance to that of "clubbing" in Cabbages. It was suggested that the condition was due to the presence of a *Myxomycetous* fungus rather than to insect agency. The specimens were accordingly sent to Mr. Lister for report.

Hunting Spider.—Rev. O. P. Cambridge reported on a spider received from the Royal Botanic Garden, Kew, on more than one occasion, and called by Mr. Cambridge *Salticus citus*, though possibly identical with *Hasarius Adansoni* of Savigny. It is a native of Amboina and other parts of the tropics. The Kew example is an adult male; the female is stouter and of a dull brown hue. The species is partially naturalised in the hothouses at Kew, and is interesting from its agile habits.

Fog Investigation.—Dr. Francis Oliver announced that he was working with the Manchester Committee, and to whom a moiety of the Government grant had been made over. In or about London six stations were established where definite quantities of air were collected and analysed.

Miscellaneous Exhibits.—Dr. Masters showed a cone of *Abies Webbiana* from Pota, imperfectly branched at an early stage of its existence, so that the apex of the cone was two-lobed, and the whole cone more or less twisted on its own axis from the check to growth experienced by the union of the two branches. The same gentleman showed specimens of *Heuchera* sp., in which not only were leaf-buds formed at the apex of the leaf-stalks, but also along the sides of the withered flower-stalks. An examination of the vascular cords of the leaf-stalk showed that whilst throughout the greater part of their length they were three in number, one central and two lateral, at the apex of the stalk they formed a perfect ring as in a true stem.

SOUTHAMPTON.

OCTOBER 27 AND 28.—The Chrysanthemum exhibition season of the present year commenced in this southern town, where, for two years, no Chrysanthemum show has been held. It was pleasant, therefore, to find that the townsfolk had conquered their apathy, and re-established an old institution with a very good exhibition, in which the classes generally were well filled, and the exhibits of good average quality.

The groups of miscellaneous plants formed a good feature of the show, and Mr. Carr, gr. to W. A. Gillett, Esq., Fair Oak Park, Bishopstoke, easily gained the 1st prize, his group showing great skill and good taste in setting up, and the plants employed were admirably suited for the purpose; Mr. W. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, was 2nd.

Groups of Chrysanthemums arranged with an eye to good effect, were not remarkable for either their high quality of plant or blossom, or in any respect, great stiffness and formality prevailing in all of them, and the sticks were very conspicuous. Mr. Busby, gr. to F. Willan, Esq., Thornhill Park, Bitterne, and Mr. H. Jones, gr. to Miss Buchan, Wilton House, Southampton, were respectively 1st and 2nd.

Specimen Chrysanthemum plants were fairly good considering the early date, but time was needed, in most cases, to bring out their flowers perfectly. Mr. E. Rose, gr. to Dr. Aldin, The Firs, Bassett, was 1st. Mr. Can made a pretty display with a collection of Orchids. We noted *Cypripedium Harrisianum*, *Odontoglossum grande*, *Cattleya Warocqueana*, *Vanda cœrulea*, *Dendrobium formosum giganteum*, and *Zygopetalum crinitum*, all very good.

Cut blooms of the Chrysanthemum were staged in large numbers, and generally of fine size and finish, especially when the earliness of the date is taken into account.

The chief class was one of twelve incurved and Japanese varieties, distinct, which brought five competitors; the best being those shown by Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Wickham, the incurved being large, fresh-looking, and well finished; and the Japanese fresh, not lumpy. The best were L. Böhmer, Stanstead White, E. Molyneux, Avalanche, and Sarah Owen, amongst the latter; Empress of India, Lord Alcester, Queen of England, Golden Queen of England, Princess of Wales, and Alfred Salter amongst the former. Mr.

J. Agate, Havant, ran this stand very close, and was placed 2nd, his Japanese being really excellent.

Mr. Molyneux exhibited fine blooms in the twelve incurved class, with Mr. Ingfield as 2nd.

There were, in the class for twelve Japanese varieties six competitors, the display made being a bright one. Mr. Trinder, gr. to Sir H. Mildmay, Dogmersfield Park, was an easy 1st, and Mr. Ingfield 2nd.

Classes were provided for twenty-four and twelve blooms in any section. These are easy classes to fill, and no wonder that the entries were many. Mr. Ingfield was an easy 1st for twenty-four, and Mr. Agate for twelve blooms. Mr. Penfold, gr. to Sir F. Fitzwygram, Bart., staged nice full flowers in the Anemone-flowered class. Mr. Agate, in the large or show class, obtained the 2nd prize; and in the Pompons class he obtained the 1st place. The handsomest stand of Chrysanthemums and other flowers was one shown by Miss K. Goldring. Fruit was exhibited in good quantity.

GOSPORT.

OCTOBER 29, 30.—For four years past it has been the custom to hold the autumn exhibition in the month of October, and with very good results, for the Chrysanthemum is an early bloomer in the district, and November would certainly prove to be too late. The Thorngate Hall provides a capital place for a meeting of this kind. Mr. Spencer, the Hon. Secretary, had all the arrangements well in hand.

Fine specimen Chrysanthemums were those of Mr. G. Hawkins, gr. to E. Laphorne, Esq., Gosport; and Mr. Battershall, gr. to A. D. Cave, Esq., Newtown, who were respectively 1st and 2nd.

Pompons were well staged by Mr. T. H. Watch, Gosport. Mr. F. Davis, gr. to Mrs. Churcher, Gosport, obtained the 1st place for a group of well-flowered Chrysanthemums.

Mr. G. Hawkins was a large prize-taker in the cut-bloom classes, winning 1st for twenty-four distinct varieties, half Japanese, and the rest incurved; and also 1st for eighteen Japanese, twelve reflexed, twelve singles, and twelve Pompons. Messrs. Foot and F. Davis following them closely. A special prize was offered for reflexed, incurved and Japanese varieties, six of each, and won by Mr. Hawkins and Mr. E. Foot. Single-flowered varieties were well to the front, and were much admired.

Grapes, Apples, Pears, and vegetables formed part of the exhibition, and were abundant and of good quality generally, but stand in no need of comment.

HAVANT.

OCTOBER 29, 30.—The eighth autumn exhibition of the Havant Chrysanthemum Society was held in the Town Hall, and it was considered to be one of the best hitherto held in Havant. The cut blooms of Chrysanthemums were large, fresh, and well shown throughout. The principal class was one for thirty-six distinct, half to be Japanese, and half incurved varieties. Mr. Payne, gr. to Mrs. E. Smith, of the Oaks, Emsworth, won the Silver Cup, which went with the 1st prize; his incurved blooms were especially full, fresh, and well finished. Mr. J. Agate, Havant, came 2nd.

For twelve varieties incurved, and twelve Japanese varieties, Mr. Payne was again a successful exhibitor, showing varieties almost identical with those in his Cup stand; Mr. C. Steptoe, gr. to G. A. Gale, Esq., Horndean, was 2nd in the former class; Mr. J. Parrot, gr. to Mrs. K. Smith, Wood End, occupying a like position in the latter.

Anemone-flowered Chrysanthemums made a large display, and a class was provided for twenty-four mixed varieties of Japanese, Anemone, and the more ordinary type. Mr. Agate, who was 1st, had a capital lot, of which most were well developed in the centre—a great point in this section. Mr. Agate was 1st for twelve reflexed Anemone blooms; Mr. Steptoe being 2nd in this and the former class.

Single varieties were plentiful, the variety Oceana being excellent; it has the faintest blush colour on a white ground, and the florets are pendent at the tips. Mrs. D. B. Crane is cerise-pink; Bessie Conway is lilac, mottled and striped with rose; and Florence is blush-white. These were some of the more striking flowers in Mr. Agate's lot. Mr. Steptoe was 2nd.

Plants in pots, whether arranged in groups, or as single specimens, were excellent. Mr. Fuller had the best group, and Mr. Penfold, gr. to Sir F. Fitzwilliam, Bart., M.P., the best specimens.

A nice lot of miscellaneous plants was shown by Mr. Woodfine, gr. to Captain Bond.

As is usual at these shows, fruit found a place here, and included Grapes and hardy fruits.

KENT COUNTY.

A SUCCESSFUL autumn exhibition was held by the above, in the Rink, at Blackheath, on Monday, November 2, and following day. The general good quality of the exhibits was remarkable, and not, as at some shows, a strong class or two, and others weak. The exhibits were arranged with taste, and the Skating Rink is a very suitable place for a show of flowers. The secretarial duties were ably carried out by Mr. Searle and an efficient committee.

Cut blooms formed the leading exhibits, and no fewer than thirty-five classes were provided for in the schedule. For the best thirty-six, half incurved and half Japanese, distinct varieties, there were five competitors. Mr. J. Doughty, gr. to Mrs. Tomlin, Angley Park, Cranbrook, was 1st for two excellent stands, the Japanese large, fresh, and bright-coloured; and the incurved flowers also large, compact, and all were neatly staged—a great matter in showing these flowers. Mr. E. G. Whittle, gr. to C. Goschen, Esq., Addington, was a close 2nd; the Japanese flowers in this exhibitor's stand were of remarkably good quality.

For the best twenty-four Japanese varieties, distinct, competition was strong, and the exhibits were excellent throughout. Mr. Blick, gr. to M. R. Smith, Esq., Hayes Common, was 1st; his stand contained a bloom of Vivand Morel (premier Japanese bloom in the show), and other novelties. Mr. G. Picker, gr. to C. E. Shea, Esq., Foot's Cray, was 2nd.

Seven growers competed in the class for twelve incurved blooms, and Mr. E. G. Whittle took the 1st prize; Mr. J. Lyne, gr. to H. F. Thinks, Esq., Foxbury, Chislehurst, was next. Mr. G. Picker, with heavy blooms of the Christine family and King of Crimsons, led the way in the class for twelve reflexed varieties; Mr. Leadbetter, gr. to A. G. Hubbuck, Esq., Elmslea Lodge, Chislehurst, 2nd.

Anemone varieties were well staged by Mr. Mitchell, gr. to Mrs. Arbutnot, Bridgen Place, Bexley, who was 1st; and Mr. A. Tomalin, gr. to S. White, Esq., Oakwood, Crayfords, who was 2nd.

Pompons were well shown by Mr. E. Tickner, gr. to J. Watney, Esq., Shermanbury House, Reigate; his Japanese blooms were largely represented in the classes set apart for specified colours.

For six of any white variety, excluding Avalanche, Mr. Doughty was 1st, with very fine blooms of Stanstead White; and for six blooms of Avalanche, Mr. J. Blackburne was 1st, with heavy blooms. For six of any yellow variety, 1st, Mr. Shea, with grand specimens of Sunflower. The best six of any colour except Sunflower were shown by Mr. Blick, his Vivand Morel being excellent.

A class was provided for Chrysanthemums of the so-called Queen family, six blooms, in not less than four varieties, and here Mr. Lyne, with very fine examples, took the 1st prize. The finest stand of six blooms of a white incurved variety came from Mr. E. G. Whittle, who had Empress of India; and for six of any colour, the same exhibitor was placed 1st, for Queen of England.

Amateurs made a great and good display, the valuable prizes inciting to much competition. Messrs. Perkins, Coventry, showed bouquets of Chrysanthemums, and Mr. W. Garton, Blackheath, had the best filled epergne.

Groups of Chrysanthemums to occupy 50 square feet were shown by five, and these being arranged at the sides of the Rink, together with other groups, consisting of foliage and mixed flowering plants, were effective. Mr. Payne, gr. to T. Williams, Esq., Oaklands, Lewisham Park, was an easy 1st, his plants being not too closely arranged, and carrying fine blooms. Mr. J. R. Rhoden, gr. to J. Vavaiseur, Esq., Rothbury, Blackheath Park, was the winner of the 2nd prize.

Mr. A. Tomalin was 1st for a group of miscellaneous plants, lightly arranged.

Table plants were numerous and excellent, and Mr. C. Lane, gr. to E. H. Coles, Esq., Burntwood, Caterham, had the best.

BRIGHTON AND HOVE.

NOVEMBER 3, 4.—Taken as an all-round exhibition, this annual gathering was one of great excellence, as was apparent in the classes for cut bloom, in which competition was keen, and in those for plants, which were well-filled. The plants were

not abnormally large, and the greater number were in the best condition. The groups to be seen at this show are amongst the best to be found anywhere. In three classes for groups, there were sixteen entries; for cut blooms in the large class, there were eight, and others mostly in proportion. The unfavourable weather for several weeks past did not appear to have had any ill-effect—at least, not on the flowers observed at this show.

Cut Blooms.—For forty-eight cut blooms, Japanese and incurved in equal proportions, Mr. Neville, gr. to F. W. Flight, Esq., Cornstiles, Winchester, was 1st, in a close competition. The uniform quality of this exhibit had great weight with the judges, and the Certificate of Merit of the National Chrysanthemum Society was awarded, in addition to the 1st prize. The second award went to Mr. Penfold, gr. to Sir F. Fitzwilliam, Leigh Park, Havant; the Japanese were equal to, if not better than in the 1st prize, but the incurved were rather weaker.

For twenty-four Japanese, Mr. Glen, gr. to Mrs. Montefiore, Worth Park, Crawley, was 1st, with a splendid lot of blooms, very fresh, in good variety, and many of extra large size. The 2nd prize went to Mr. Phillips, gr. to Dr. Baber, The Deodara, Meopham, Kent.

In the class for twenty-four incurved varieties, Mr. Phillips was easily 1st, with a fine even lot of blooms.

For twelve incurved varieties, Mr. Jupp, gr. to G. Boulton, Esq., Eastbourne, was a good 1st, the blooms of extra size and good quality, without any overdressing; Mr. Emery, gr. to M. G. Megan, Esq., Avoca, Eastbourne, took 2nd place, with good blooms.

For twelve Japanese, Mr. Emery was 1st, showing fine blooms of the usual varieties; Mr. Fowler, gr. to Mrs. Hall, Barrow Hill, Henfield, was a close 2nd.

Mr. Phillips was 1st for Anemones, with splendid flowers; he also taking 1st for reflexed.

For six blooms of any one kind of incurved, Mr. Russell, gr. to Dr. Lewis, Henfield, was 1st with Violet Tomlin; Mr. Snow, gr. to C. and A. de Muriette, Esqrs., Wadhurst Park, being a good 2nd, with W. G. Droyer, of the Queen type.

For six blooms of Japanese, Mr. Glen was placed 1st with extra large and fresh blooms of Avalanche; Mr. Emery following him very closely indeed with large and richly coloured Edwin Molyneux; Mr. Fowler being 3rd in this, an extra strong class, with Thunberg, large and fine.

With Pompons, Mr. Russell was 1st.

Messrs. Perkins & Son, Coventry, were 1st, for a bouquet of Chrysanthemums with a pretty combination. Mr. G. Miles, Victoria Nursery, Dyke Road, Brighton, 2nd. The judges might have reversed the order without much difficulty; in these exhibits they were very close.

For a single stand, Mr. Brockway, gr. to A. S. Culley, Esq., Burgess Hill, was 1st, with a beautiful arrangement of Source d'Or.

Plants: Groups.—In the class for a group of thirty plants, not less than fifteen varieties, Mr. Miles, Bristol Nurseries, Kemp Town, Brighton, was an easy winner, the plants were individually good specimens, with an average of over twenty-four flowers of good quality upon each plant; Mr. Hill, gr. to M. Wallis, Esq., Withdeane, was 2nd, with freely-grown plants of the best varieties.

In the next class, Mr. James Thorpe, West Hill Road, Brighton, was 1st in a strong competition. The variety in this group, with the extra fine quality, were its strong points, combined with the finish as a whole; Mr. Collis, gr. to J. Barnes, Esq., Alexander Villas, Brighton, came a good 2nd, consisting chiefly of the larger-flowering kinds, Japanese in particular, being strong.

In the following class, for twelve plants stood upon the floor with an undergrowth of foliage plants, Mr. Fry, gr. to C. W. Catt, Esq., Brighton, was 1st, with well-grown plants effectively arranged. Mr. House, gr. to F. Mewatt, Esq., Withdeane Hill, was a good 2nd, the variety not so fine. This kind of grouping, combining good cultural display with effect, is worthy of encouragement.

The class for four dwarf-grown plants contained some of the best plants in the show. The 1st prize lot from Mr. Scutt, gr. to Mrs. Jenkins, Burgess Hill, would have been an ornament to any exhibition, and very hard to beat. They were Maiden's Blush (very fine indeed), Madame de Sevin, Peter the Great, and Hiver Fleuri. The National Chrysanthemum Society's Certificate was also awarded here; these plants averaged 4 feet diameter. Mr. Hill was a good 2nd, Source d'Or being shown remarkably well.

Decorative plants in small pots made a good display, the best coming from Mr. Fairs, gr. to R. Clowe, Esq., Hassoeks.

Mr. Scutt was also 1st for four standards, with profusely-bloomed plants, the heads large, the best being Bertha Rendatler and Maiden's Blush; Mr. Hill following again very closely with similar plants; and he also took 1st for four pyramids, Roseum superbum being one of his best, Elaine also good. The best single specimens were from Messrs. Scutt and Hill in respective classes.

Mr. Scutt was again successful for six plants of Pompons, with dwarf-grown examples, very pretty, and not over-trained.

Cyclamens were best from Mr. House, whose plants were equal to those seen at our best shows in the spring time.

Double Primulas were very superior, the best twelve coming from Messrs. W. Miles & Co., West Brighton Nurseries; and the best six from Mr. House.

The classes for single Primulas were very well filled, the most successful prize-takers being Messrs. Hill and Collis, each showing in respective classes freely-flowered plants of good strains.

The show of fruit was an excellent one in all classes. For black Grapes, Mr. Kemp, gr. to Scrase Dickens, Esq., Coolhurst, Horsham, was 1st, with very fine Lady Down's Seedling; and Mr. Glen in the same position, with Muscat of Alexandria, well kept and coloured. Mr. Glen was also 1st for four dishes of culinary Apples, and the same of dessert Pears; amongst the latter were very fine fruits of Belle de Bruxelles and Doyenné du Comice.

Mr. Duncan was 1st for dessert Apples, with standard kinds, finely coloured. The competition in the fruit classes, and, in fact, throughout the entire show, was unusually good. No doubt, greater encouragement is given by offering 4th prizes in all chief classes.

Of the newer Chrysanthemums, Louis Boeber was to the fore in several stands, whilst there were a few good blooms of Mrs. Alpheus Hardy. Mr. Wells showed his sport W. Wells, which was shown at the last Royal Horticultural Society's meeting. He had also a very promising seedling single variety, of the colour of Cullingfordii. Mr. Owen had several seedlings, the best being one from reflexed Putney George, a fine and distinct flower.

BRIXTON, STREATHAM, AND CLAPHAM HORTICULTURAL.

NOVEMBER 3, 4.—Very diverse generally is the exhibition of this society from that of ordinary Chrysanthemum societies, because Chrysanthemums form only an ordinary part of the general body of exhibits. The show was held in the Streatham Town Hall, and was, perhaps, the first of the suburban winter exhibitions. It was also a very bright charming show, full of meritorious objects, the fine hall being used to its utmost capacity.

Orchids.—Specially attractive were these for the time of year, some two and a half dozens of excellent pieces in good bloom being staged in the competitions. Mr. Ranson, gr. to J. F. Gabriel, Esq., had the best six, in capital *Cattleyas aurea* and *Warocqueana*, *Vanda cœrulea*, *Ocidioides tigrinum*, *Calanthe vestita rubra*, and *Cypripedium Spicerianum*. *Dendrobium formosum giganteum*, *Cypripedium Harriaianum*, *Odontoglossum grande*, and *Pleione maculata* were excellent in other collections. A very fine *Cypripedium insigne*, from Mr. Ranson, was the best single specimen; and Mr. Wiggins, gr. to O. von der Meden, Esq., had the best three plants in *Odontoglossum Rogersii*, *O. grande*, and *Dendrobium formosum giganteum*.

Foliage plants were very largely shown. The best four were fine *Alocasias metallica* and *crystallina*. A good *Dracœna* and a Palm came from Mr. Hall, gr. to J. A. Ryder, Esq.

Ferns also were very numerous and good, the best four plants being staged by Mr. Wright, gr. to A. Whitehead, Esq. *Platycerium grande*, *Gymnogramma Laucheana gigantea*, *G. peruviana*, and *Adiantum Farleyense* were first-rate. A beautiful plant of *Gymnogramma schizophylla gloriosa* was included in other collections. There were some stove and greenhouse plants in bloom shown; the best three from Mr. Hill were *Pancreatium fragrans*, *Allamanda Hendersoni*, and *Bouvardia Alfred Newnea*. Chinese Primulas were very good also. Mr. Murrell, gr. to Mrs. Burton, had twelve very fine plants, capitally flowered. There were table plants, epergnes, floral-baskets, bouquets, &c. in great variety. The most effective group of Chrysanthemums was set up by Mr. Poulton, gr. to C. T.

Cayley, Esq. Mr. Weston, gr. to D. Marbucar, Esq., had the best six trained Japanese plants, Elaine and Mons. Jacotot being specially good. Mr. Cherry had the best six incurved trained plants of the usual varieties; and Mr. R. Clarke the best three. Mr. Austin also had the finest six trained Pompons, all good plants. In the chief classes for cut blooms, Mr. Howe, gr. to H. Tate, Esq., had the

FIG. 76.—*BEGONIA TUBEROSA VITTATA*: WITH STRIPED BLOSSOMS.

best twenty-four incurved, Alfred Lyne, Violet Tomlin, Princess of Wales, and Lord Wolsley, being particularly good. Mr. Murrell had the best twenty-four Japanese, having Mrs. Clarke, of inordinate size. Mr. Howe had the best twelve Japanese, showing some beautiful blooms. Other classes for cut blooms were well filled. A class for twelve Japanese on tall stems brought seven

FIG. 77.—*GAILLARDIA, LORENZ'S PERFECTION*.

exhibits, but were much too crowded to produce any good effect.

Grapes were capital. Mr. Howe was 1st, with three bunches of Alicante in two classes for blacks, and with Muscat of Alexandria in a class for whites, all being first-rate.

Apples and Pears were abundant and good, so also were vegetables in two classes, all shown admirably in large flat baskets. Messrs. J. Peed & Sons showed a good collection of Apples; Messrs. Canoll & Sons twelve fine blooms of Louis Boeber Chrysanthemums; and Mr. W. Roupell, the Hon. Sec., a fine basket of Grapes.

WATFORD CHRYSANTHEMUM.

THE sixth annual exhibition of the above was held in the Agricultural Hall, Watford, on Tuesday and Wednesday, November 3 and 4, and proved, as in former years, a great success, the attendance being very large on both days. The entries greatly exceeded expectation, no fewer than 1300 cut blooms being entered. The splendid group of miscellaneous plants sent by the President (the Earl of Clarendon), was a striking feature in the show; the whole consisting of many fine plants of the best of Chrysanthemums, relieved with Palms, &c.

The principal prizewinner in all the classes was H. H. Gibbs, Esq., M.P., Aldenham House (gr., Mr. E. Neve). This gentleman was 1st for a miscellaneous group of plants, the principal varieties of cut blooms, and several of the prizes for vegetables (one for the best exhibit in the show); also prizes for Grapes.

Mr. C. R. Humbert, Hon. Sec. of the Society, was successful in carrying off the 1st prize, for a group of Chrysanthemums, on a space not exceeding 50 feet, in the open class. He was also awarded an aneroid barometer, for the best group in the show.

Mr. C. Van Raalte, Mr. J. Trotter, Mr. T. F. Blackwell, Mr. G. Sturman, and Mr. P. Bosanquet shared the greater part of the remaining awards for cut blooms. Mr. Robins won the prize offered by the Society to members for the best group of Chrysanthemums (50 square feet); Lord Esher being 2nd, with a prettily arranged group. Mr. A. Scrivener, florist, of Watford, was 1st for a wreath, two bouquets, and crosses of mixed flowers.

Among the various varieties shown was a splendid group of zonal Pelargoniums, Anemone and Pompon Chrysanthemums, Chinese Primulas, Cyclamens, and table plants. *A Correspondent.*

CONTINENTAL NOVELTIES.

We are enabled, by the kindness of M. E. Benary, seed merchant and grower, of Erfurt, to offer our readers an illustration (fig. 76) of a new striped *Begonia tuberosa vittata*, raised by him. So far as we know, our raisers of new Begonias have not been so fortunate as their Continental brethren in obtaining varieties with similar markings. The seed is said to produce 40 per cent. of striped or rayed flowers. The flowers sent to us were considerably larger than those here figured.

The other novelty (fig. 77), which we figure from a block kindly lent us by Herrn C. Lorenz, seed grower, Erfurt, is *Gaillardia Lorenz's Perfection*. It is an improvement on his *G. picta Lorenziana*, raised by him some eight years ago. The quilled petals are produced in great numbers, and form a globular bloom, not flattish, as in *G. P. Lorenziana*. It is a fine subject for bouquets.

SCOTLAND.

NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.

THE monthly meeting of the North of Scotland Horticultural Association was held on October 21 in the Upper Hall of the Young Men's Christian Institute, Aberdeen, Mr. D. M. Smith, retiring President, in the chair. A proposal to admit apprentice gardeners to the Association at an annual subscription of 1s. was adopted. Mr. C. S. France, the newly-elected President, then took the chair, and proceeded to deliver his opening presidential address. He thought they ought to make their programme a little more varied and comprehensive. He impressed upon them the advantage of careful observation of every freak of Nature that might come under their notice, and advised them to bring such matters before the Association for discussion, and if possible solution. In regard to what he had suggested with reference to the widening of the scope of the Society, what he particularly advised was, that papers should occasionally be given on such subjects as botany, vegetable physiology, geology, mineralogy, the nature and quality of soils, chemistry, entomology, and meteorology; he also directed their attention to

the importance of landscape gardening. A paper was also read by Mr. R. Farquhar, late of Fyvie Castle, on "Some Impressions of America," for which the thanks of the Association were also accorded. The meeting then terminated.

LAW NOTES.

THE LAW WITH REGARD TO BEES.

A CASE of interest to beekeepers was heard before Judge Prentice at the Bow County Court on October 5. Mr. W. J. Sheppard sued Mr. Alfred Cottage, builder, of Chelmsford Road, Woodford, for the value of two swarms of Ligurian bees, destroyed by him and his son on July 10 and 11. Mr. Simmonds, for plaintiff, said his client was honorary District Secretary to the Essex Beekeepers' Association, and the case was of the greatest interest to every keeper of bees. Plaintiff's premises adjoined defendant's, and it was held by Blackstone that if a swarm of bees escaped from the owner's premises, they remained his property whilst he kept them in sight, and he was legally justified in following the bees on to any other person's land, with a view of recovering them. Mrs. Sheppard deposed that on July 10 last she saw a swarm leave one of her husband's hives, and go on to a tree in Mr. Cottage's paddock. Defendant and his son came up with a pan filled with tar or something of the kind, which they lighted, and placed under the bees. They shook the bough, and the bees dropped into the fire, and were burned. Another swarm issued the next day, when she saw the same thing done. By Mr. Haynes (for the defendant): I heard a complaint from a Mrs. Stubbings, living close by, respecting bees, which she said were ours, spoiling some wine she was making. (His Honour: I don't place my wine in my garden. I should expect bees to get in it I did.) I did not hear defendant complain that our bees had stung his nurse. None of the bees came back to the hives.

Walter Debuam, of Chelmsford, expert to the Essex Beekeepers' Association, was next called, and said he had had several years' experience of bees, and got his living amongst them. Witness said it was the custom all over Essex, and indeed throughout the kingdom, when bees swarmed on to another person's premises, for the owner to go and take them. Mr. Haynes: But we never refused their coming on to our premises for them. Mr. Debuam: It is the custom to allow the bees half an hour or so to settle before asking leave to take them away. The defendant killed the bees before they were properly settled.

His honour suggested that the parties should settle the matter between them, but the plaintiff would not agree.

Mr. Haynes said that for years the plaintiff's bees had damaged his client's fruit trees. Still he did not press for a counter-claim. His honour: How could they damage his trees?

Ultimately, judgment was given for plaintiff (by consent) for five shillings, with costs, as from £5 to £10; the defendant, if he wished, having leave to appeal.

A BAD CROP OF ONIONS.

At Romford, James M. Manning, farmer, of Ashwells, Brentwood, sued Messrs. James Carter & Co., seedsmen, of High Holborn, for £2 6s., for loss alleged to have been sustained by the defendants supplying him with inferior Onion seed. He had in court a sample of the Onions represented to have been grown from the seed, and they had a very withered appearance, and were apparently worthless. The plaintiff said he ordered 1 1/2 lb. of the very best Onion seed they had. He received the seed and sowed it. A copy of the invoice was put in, and this bore the printed notice: "We guarantee our seeds according to the quality purchased to be of the highest average standard of vitality of the season, and it is open to the purchaser to confirm this by submitting samples to professional analysis at his

own expense. We cannot, however, be in any way responsible for the produce of the seeds sold under this guarantee or for errors of description, and it must, therefore, be clearly understood our responsibility ceases upon the final acceptance of the goods." His Honour: Whether that is a reasonable condition I cannot say. Mr. Robinson: It has been held so. His Honour: Then I should say he took the seed upon these terms. I shall hold that the plaintiff bought the seed on these terms, because he had the option of rejecting. His Honour then gave judgment for the defendants with costs. Mr. Robinson: I must say, in justice to my clients, that all their seeds are tested before being sent out.

VARIORUM.

THE FLORA OF DIAMOND ISLAND.—Diamond Island is situated at the mouth of the Bassem River, in the Indian Ocean, about 5 miles from Pagoda Point, and 8 miles from Cape Negrais, and in about 16° N. lat. It is of sandstone formation, somewhat exceeds a square mile in area, being about twice as long as broad, and the central part is a kind of plateau 60 feet or so above the level of the sea. With the exception of a small clearing for a telegraph station, the island is densely wooded down to the sea, but there is no Mangrove belt on any part of the sandy coast, unless it be considered as represented by a few patches of *Avicennia officinalis*. Thus is the island described, though in greater detail, by Dr. T. PRAIN, Curator of the Herbarium of the Royal Botanic Garden, Calcutta, who has visited the island in H.M. Indian Marine Survey steamer "Investigator," commanded by R. F. Hoskyn, R.N. Dr. PRAIN has published an elaborate analytical account of the flora in the Journal of the Asiatic Society of Bengal. He collected eighty-six species of flowering plants, three Ferns, and four funguses, among which there was not a single novelty. The enumeration includes a number of cultivated plants, among them the Coconut Palm; but these are all of recent introduction. It is supposed that the island was not previously inhabited, and therefore that the vegetation of the dense wood overspreading the island is quite natural. The most interesting fact brought out is the evident affinity with the somewhat distant Andaman flora, pointing to a former connection. The Report is also valuable to the student of plant-distribution, for the details it contains of the habitats and relative frequency of the component species of the vegetation.—*W. Botting Hemsley, in "Nature."*

TRADE NOTICE.

Mr. GEORGE BLADES, late gardener at Fern Grove, Grimsby, has taken the Humber Nurseries, Thorold Street, New Cleve, Grimsby, which were until lately in the occupation of Mr. J. Smith.

MARKETS.

COVENT GARDEN, November 5.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Trade slow, with shorter supplies. *James Webber, Wholesale Apple Market.*

Owing to the better weather, Potatoes are arriving in larger quantities, although values on the whole are fairly maintained. Magnum, 65s. to 80s.; Imperators, 75s. to 85s.; Hebrons, 70s. to 80s.; Giants, 75s. to 90s.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 3.—Quotations:—English Apples, 3s. to 6s. per bushel; American do., 10s. to 20s. per barrel; Pears, 1s. to 2s. per sieve; Plums, 3s. to 3s. 6d. per half-sieve; Damsons, 3s. 6d. to 4s. do.; Bullaces, 1s. to 1s. 6d. do.; Tomatos, 4s. 6d. to 7s. per peck; foreign do., 1s. to 2s. per box; Seakale, 1s. to 1s. 6d. per punnet; Cabbages, 1s. to 2s. per tally; Savoys, 2s. to 3s. do.; Radishes, 2s. to 3s. 6d. do.; Greens, 1s. to 1s. 6d. per doz. bun.; Tarrops, 1s. 6d. to 2s. do.; Carrots, 1s. to 2s. 6d. do.; Onions, 2s. to 2s. 6d. do.; Parsley, 1s. 6d. to 2s. 6d. do.; Beetroots, 2s. to 2s. 6d. do.; Spinach, 1s. to 1s. 6d. per bushel; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Parsnips, 4d. to 6d. per score; Cos Lettuce, 6d. to 9d. per score; Cabbage do., 3d. to 4d. do.; Cauliflowers, 1s. to 1s. 6d. per doz.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 4s. 6d. to 5s. cwt.; Belgian do., 3s. to 3s. 3d. per bag of 100 lb.; Dutch do., 3s. to 3s. 6d. do.; Spanish do., 6s. to 6s. 6d. per case; Celery, 6d. to 1s. per bundle; Horseradish, 1s. to 1s. 1d. do.; frame Cucumbers, 1s. 6d. to 2s. per dozen.

BOROUGH: Nov. 3.—Quotations:—Cabbages, 2s. 6d. to 4s. per tally; Marrows, 2s. to 4s. do.; Broccoli, 3s. to 5s. do.; Turnips, 1s. to 1s. 6d. per dozen bunches; Carrots, 1s. to 1s. 9d. do.; English Onions, 4s. to 5s. per cwt.; Pears, 2s. 6d. to 7s. per bushel; Canadian Apples, 12s. to 15s. per barrel.

STRATFORD: Nov. 4.—There has been an abundant supply of vegetables and fruits at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. to 3s. per tally; Savoys, 2s. 6d. to 4s. 6d. do.; Greens, 1s. to 1s. 6d. per dozen bunches; do., 4s. to 5s. per tally; Cauliflowers, 9d. to 1s. 3d. per dozen; do., 3s. to 5s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 35s. to 45s. do.; do., cattle-feeding, 24s. to 32s. do.; Parsnips, 60s. to 70s. do.; Mangels, 15s. to 20s. do.; Swedes, 20s. to 25s. do.; Onions, English, 100s. to 115s. do.; do., Dutch, 3s. 6d. to 4s. 3d. per bag; do., Oporto, 6s. to 6s. 6d. per case; Apples, English, 2s. to 6s. per bushel; do., American, 12s. to 20s. per barrel; Collards, 1s. 6d. to 2s. 6d. per tally; Celery, 8d. to 1s. per roll.

SEEDS.

LONDON, Nov. 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that a better and stronger feeling prevails for red Clover seed; the run of late has been more particularly upon choice yearling samples, for which considerably enhanced terms are now asked. There is no change in either Alsike, white, or Trefoil. Winter Tares are now temptingly cheap. Rye is firmer. Blue Peas are in limited supply, growers are gratified with the prices at

present obtainable in London for fine blues. White Runner Beans continue in brisk request. The low rates ruling for Haricot Beans attract attention. Bird seeds keep firm. Linseed goes against the buyer.

POTATOS.

SPITALFIELDS: Nov. 3.—Quotations:—Magnums, 60s. to 80s.; Regents, 60s. to 70s.; Champions, 50s. to 75s.; Imperators, 60s. to 80s.; Hebrons, 55s. to 80s.; Early Rose, 50s. to 70s.; Snowdrops, 60s. to 80s. per ton.

BOROUGH: Nov. 3.—Quotations:—Hebrons and Elephants, 70s. to 85s.; Imperators, 60s. to 75s.; Bruces and Magnums, 60s. to 80s. per ton.

STRAFORD: Nov. 4.—Quotations:—Magnums, 60s. to 80s.; Imperators, 60s. to 80s.; Elephants, 65s. to 75s.; Snowdrops, 65s. to 80s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Oct. 31, and for the corresponding period in the previous year:—1891, Wheat, 35s. 11d.; Barley, 30s. 7d.; Oats, 19s. 5d. 1890, Wheat, 31s. 6d.; Barley, 29s. 7d.; Oats, 17s. 5d. Difference: Wheat, +4s. 5d.; Barley, +1s.; Oats, +2s.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.			
	ACCUMULATED.					Ins.	No. of Rainy Days since Jan. 4, 1891.	Total fall since Jan. 4, 1891.	Percentage of possible Duration for the Week.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 31, is furnished from the Meteorological Office:—

"The weather has been finer and drier than for a long while past, especially over the more northern parts of the Kingdom, where scarcely any rain has fallen. Fog or mist has, however, prevailed in various parts of the Kingdom.

"The temperature has been a little below the mean in all but the eastern and southern parts of England, the deficiency being greatest (about 3°) in Ireland and Scotland. The highest reading, which occurred on very various dates, ranged between 55° and 57° in most districts; but in England, S., the thermometer reached 58°, and in the 'Channel Islands' it rose to 61°. The lowest values were recorded on one or other of the three concluding days, when sharp frost was experienced in most districts. In the north and east of Scotland the thermometer fell to 20° or 21°, and in the 'Midland Counties' and 'Ireland, N.'

to 24°; in the 'Channel Islands' the lowest reading was 39°.

"The rainfall has amounted to about half the average in the eastern, central, and southern parts of England, but in all the more northern districts, the fall has been quite unappreciable, and at many stations there has been absolutely none.

"The bright sunshine has been considerably more than the mean in all districts excepting 'England, E.' The percentage of the possible duration has exceeded 40 in most parts of the Kingdom, and has exceeded 50 in 'Ireland,' the north-west of 'England,' the north of 'Scotland,' and the 'Channel Islands,' the highest value of all (64) being in 'England, N.W.,' where the amount of sunshine has been three times as much as the normal."

NOTICES TO CORRESPONDENTS.

BOOKS: Propagation of Soft-wooded Plants (Auguste Reiser); Thomson's Handy-book of the Flower-Garden, 4th Edition (W. Blackwood & Sons, Edinburgh and London).—T. Hacking. 1. The Journal of the Royal Horticultural Society. Apply to Mr. J. Weathers, assistant-secretary at the office of the Society, 117, Victoria Street, Westminster; 2. Thomson's Handy-book of the Flower-Garden (Blackwood & Sons, Edinburgh and London).—R. H. B. Handy Book of the Flower Garden, by David Thomson (Blackwood & Son); Select Stove and Greenhouse Plants, by B. S. Williams & Son, Victoria Nursery, Upper Holloway, N. It you want merely a list of garden plants, any good nursery list would answer your purpose.—Floral Decorations: E. P. Miss Hassard's book may be bought at the second-hand booksellers for a few pence.

CENTIPEDS: C. E. P. The creatures prefer decaying vegetable matter. They are not likely to injure the bulbs, but it is possible they might take a fancy to the roots if there was not sufficient decaying matter available.

CHRYSANTHEMUM BLOOMS: E. W. There are few of these that do not require dressing more or less, and all of them should be cut with stems about 6 inches longer than the tubes they will be shown in. Japanese, with drooping florets, should have stems long enough to just keep the tips of these from touching the table.

COINAGE OF POPULAR NAMES: A. While always availing ourselves of established popular names, we think it preferable not to coin new ones, except under certain circumstances. The canon adopted at the Paris Nomenclature Congress, art. 68, says:—"Every friend of science should resist the introduction into a modern language of names of plants, which had no previous existence therein, unless they are derived from Latin botanical names, or slight modifications." Thus it is allowable, and indeed preferable to say, Conifers instead of Coniferae, and so far as we are concerned, we should prefer the term Conifera to that of "Cone-bearing trees and shrubs."

CORRECTION.—In our report of the Royal Horticultural Society in our last issue, p. 529, the name of Mr. Holford's gardener, Westonbirt, Tetbury, was printed Quarterman instead of Chapman.

CUCUMBER ROOTS: E. W. The swellings on the roots of your plant are due to eel-worms, so often described and figured in these columns. You must turn out your plants, and burn both them and the soil, and start afresh another season with fresh soil.

EPIDENDRUM: A. A. Yes; please send another flower when it opens. Accidents will happen, in spite of our best endeavours to avert them.

LECTURES ON HORTICULTURE: A. M. M. See the leading article in the Gardeners' Chronicle for October 31, and select your twelve lectures from that.

NAMES OF FRUITS: H. J. Z. 1, Reineette du Canada; 2, Emperor Alexander; 3, not recognised; 4, Court of Wick; 5, Damelow's Seedling; 6, Golden Pippin; 8, Beurré d'Amanlis; 9, Autumn Bergamot.—A. K. 1, Duke of Beaufort; 2, Cox's Orange Pippin; 4, Alfriston; 6, Claygate Pearmain.—A. C. 1, Hacon's Incomparable; 2, Beurré Bosc; 3, Swan's Egg; 4, Marie Louise d'Uccle; 5, British Queen; 6, Jersey Gratioti.—E. C. 1, Marie Louise; 2, Bergamot d'Esperen; 3, Louise Bonne of Jersey; 4, Beurré Diel; 5, Cellini; 6, Hambleton Deux ans.—W. Parker. 1, Louise

Bonne of Jersey; 2, Beurré Bosc; 3, Vicar of Winkfield; 4, Beurré de Capiaumont; 5, Black Worcester; 6, Comte de Lamy.—Carter, Page & Co. 1, not known; 2, St. Germain; 3, not recognised; 5, Bergamot d'Esperen; 6, a small Marie Louise; 7, Urbaniste.—G. M. Pear: King Edward; 1, Queen Caroline; 2, King of the Pippins; 3, Adams' Pearmain.—Twed. Your specimens are so very small, it is almost impossible to identify them—we do our best. 1, King of the Pippins; 2, Betty Greson; 3, Lord Derby; 5, Cox's Orange Pippin; 6, Golden Noble; 7, Cellini, or small Emperor Alexander.—H. T. 1, Rymer; 2, Bess Pool; 3, Colonel Vaughan; 4, Reineette du Canada; 5, Beurré Bosc; 6, Van Mons. Léon Leclerc.—W. H. S. 1, Golden Reineette; 2, King of the Pippins; 4, Pomme de Neige; 5, Worcester Pearmain; 6, Gravenstein.—Enfield. 1, Scarlet Nonpareil; 2, 3, Fearn's Pippin; 4, Mère de Méage; 5, Golden Noble; 6, Waltham Abbey Seedling; 7, Winter Pearmain; 8, Blenheim Orange. Pears: 8, Josephine de Malines; 9, Colmar d'Éré; 10, Beurré Bosc; 11, Thompson's; 12, Autumn Bergamot; 14, Glou Morcean. The number far exceeds our limit of six.—In Dutch bulb bags—no letter. 1, Beurré Diel; 2, Gansel's Bergamot; 3, Flemish Beauty; 5, Josephine de Malines; 6, Paradis d'Autonne; 7, Eyewood; 8, Bergamot d'Esperen.—J. P. 1, Grenadier; 2, Beauty of Kent; 3, Brownlee's Russet; 3, Lord Suffield; 4, French Crab; 5, Cockle Pippin; 6, Braddick's Nonpareil; 7, Brabant Bellefleur; 9, Manx Codlin; 10, Lord Derby; 12, Pine Golden Pippin. We cannot name more at this time—six is our limit. The Pears must wait.—G. S. T. 1, Annie Elizabeth; 2, Jolly Beggar; 3, Golden Noble; 4, Manx Codlin; 5, Golden Noble; 7, Cellini.—Leamington. Your Apple is Warner's King.—D. R. P. 1, Passe Colmar; 2 and 4, not recognised; 3, Duchesse d'Angoulême.—W. Russell. Your Seedling Apple seems to be quite distinct, and is a large and very handsome fruit, well worthy of extended culture.—T. S. 1, Lane's Prince Albert; 2, Lord Grosvenor.—G. G. 1, Maréchal de la Cour; 2, Louise Bonne of Jersey; 3, Beurré d'Amanlis; 4, Uvedale's St. Germain; 5, Beurré Hardy; 7, Colmar d'Éré; 8, Beurré Diel. Apple: Hawthornden.—Herbert Gray. Beurré de Capiaumont.

NAMES OF PLANTS: Helen. 1, Juniperus sinensis; 2, a form of the Douglas Fir; 3, Retinospora pisifera; 4, Juniperus, perhaps communis; 5, Cephalotaxus pedunculata var. fastigiata; 6, Platanna var. orientalis.—M. S. T. Probably the Black Italian Poplar, Populus monilifera.—W. S. 1, Lobelia siphilitica; 2, Aster Novi-Belgii.—P. S. Cupressus funebris, a most interesting and beautiful species, introduced from China by Fortune; see Gardeners' Chronicle, 1850, p. 439. It is hardy in the southern counties. A warm conservatory would be needlessly warm.—T. E. S. Cypridium insigne. The Abutilon we do not know.—E. W. G. Crataegus Crus-galli.—E. M. Calceolaria pinnata.—A. C. E. Salvia Horminum.

PRINCE OF WALES PEACH: P. S. A large well-flavoured variety, ripening on the open wall in mid-September. It is scarcely so good a fruit as Prince of Wales, which ripens at the end of the same month.

THE DOUGLAS FIR: A. We had thought that the technical name this tree should bear was settled according to the spirit of the Paris Nomenclature Congress, see art. 64; but, some of our transatlantic friends think otherwise. The question is purely one for the botanists to settle. In the meantime we recommend you to use the English name, which has remained, and probably will remain unaltered, whatever changes may take place in botanical nomenclature.

VINE LEAF: Munches. Your leaf from Grenoble is remarkably rich in colour, but unknown to us.

WEED-KILLER: A Subscriber. At this season, selecting a dry day for its application. It is better when applied in September.

COME AT ONCE, COME EVERYBODY,

And see the **Finest Plant House in London** (30 ft. by 10 ft.), fitted with

TOOPE'S PATENT FOG ANNIHILATING AND VENTILATING SYSTEM,

Filled with choice Orchids and other plants, all happy and blooming, situated directly beneath a large steam boiler, the smoke and fumes from which, and other factories, including chemical works (also near the Commercial Gas Company's Works), fill the surrounding atmosphere with everything detrimental to Plant, and more especially Orchid life.

The house is heated with our well-known Patent

CHAMPION and PERFECTION BOILERS.

All who wish to learn a SURE system of growing the choicest plants in smoky cities and foggy districts, are cordially invited to inspect the system; also, all who are about to select Heating Apparatus, should call and see ours in operation, before making a selection.

WE CAN SATISFY EVERYBODY, AND GUARANTEE ALL WE SELL.

Hundreds of First-class Unsolicited Testimonials.

ILLUSTRATED CATALOGUE of NOVELTIES, three stamps.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by

DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.**

"Nothing Succeeds like Success."

HUGHES' (SOLUBLE) INSECTICIDE FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsman & Chemists, 1/6, 2/6, & 4/6; $\frac{1}{2}$ -gallon 7/6, 1-gallon 12/6, or less in larger quantities.

A Treatise on FIR-TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to

E. GRIFFITHS HUGHES, Victoria-st., Manchester.

WHOLESALE from all the London Seed Merchants and Patent Medicine Houses.

NEW YORK—A. ROLKER & SONS.

GISHURST COMPOUND used since 1859

for Red Spider, Mildew, Thrips, Greenfly and other blight, 20 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. NOTICE TO ADVERTISERS.—In many instances

Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 6s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE MONEY ORDER.**

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the **PUBLISHER.**

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

FARMS, ESTATES, RESIDENCES.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS, on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for terms. SPECIMEN FREE. Price 2d. Published Friday for Saturday.

TO SALESMEN.—Situation wanted by a young man, age 21; to get knowledge of a Salesman's business.—X. Y. Z., 20, High Street, Lynn.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the respiratory organs. In common colds and influenza, the Pills taken internally, and the Ointment rubbed over the chest and throat are exceedingly efficacious. When influenza is epidemic, this treatment is the easiest, safest, and surest. Holloway's Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the over-gorged air-tubes, and render respiration free, without relaxing the strength irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints, by which the health of so many is seriously and permanently injured in most countries.

TO THE TRADE.

STREPTOCARPUS, NEW HYBRIDS. VEITCH'S STRAIN.

*Award of Merit for the Strain, Royal Horticultural Society's Exhibition, May 29, 1891.
Four Certificates of Merit, Royal Botanic Society's Exhibition, April 22, 1891.*

JAMES VEITCH & SONS

Beg to direct special attention to this **STERLING NOVELTY**:—

The above illustration is taken from the photograph of a plant growing in our Chelsea Nursery.

THIS beautiful new race of STREPTOCARPUS originated at the Royal Gardens, Kew, where Mr. Watson crossed *S. Rexii* and *S. parviflorus* with *S. Dunnii*, and raised several charming new varieties.

From the numerous complimentary letters which reach us respecting the very satisfactory results obtained from the seed distributed last season, and the favourable comments of the Horticultural Press, we feel sure that these hybrids have a splendid future. The results of last year's work upon these has been to give us larger and more expanded flowers, and a considerably increased proportion of the rarer and the brighter colours, particularly among the rose, rosy-purple, reddish, and magenta shades; and from the seed now offered, which has been further hybridised, many entirely new and striking varieties may be confidently expected.

The plant is a greenhouse perennial, of dwarf, neat habit, growing about 9 inches high, with rather long, narrow, arched and recurved stemless leaves.

These new hybrids are remarkable for their abundance of bloom, and the continuous succession in which the flowers are produced for about four months in the summer and early autumn, and also for the long time the individual flowers last in perfection.

The flowers, which are very graceful in form, are trumpet-shaped, widely open, and slightly recurved at the mouth, and measure about $1\frac{3}{4}$ inch in length. They are generally produced in a horizontal or semi-upright position, thus displaying their full beauty.

The variation of colours in these new hybrids is very striking, scarcely two plants being exactly the same, and the colours range from pure white, through pale lavender, lavender-blue, lilac-blue, light mauve, purple, violet, bright rose, and red to rich rosy-purple, with all the intermediate tints, and in all the flowers the throat and three lower segments are more or less marked or splashed with long blotches or spots of various shades of purple, generally shaded and relieved with white, which greatly enhances the effect, and affords a pleasing contrast of colour.

If seed is sown the end of January and February, the plants come into bloom the following June and July, and continue flowering freely until the end of September and October.

Per Packet, 2s. 6d.

PRICE TO THE TRADE ON APPLICATION.

MESSRS. PROTHEROE AND MORRIS will
SELL on FRIDAY, November 20, at their Central Sale
Rooms, 67 and 68, Cheapside, London, E.C., by ORDER of
Mr. F. SANDER—

CECLOGYNE DAYANA GRANDIS.

The GARLAND ORCHID,

bigger and longer than Ceclogyne Dayana.

Offered for the first time.

Flower-spikes up to 5 feet, with nearly 100 flowers on
each spike.

GRAND PLANTS IN PANS and BASKETS, BREAKING
FREELY.

Friday Next.

BROUGHTONIA SANGUINEA.

Splendid leafy masses of this beautiful and rare rich crimson
Orchid, which blooms in spring, and lasts three or four
months. The plant is very difficult to import, and the
plants offered are in grand condition.

ONCIDIUM TRIQUETUM.

A pretty dwarf species, with elegant sprays of white and
blood-red flowers.

MESSRS. PROTHEROE AND MORRIS will
include the above in their SALE of ORCHIDS on
FRIDAY NEXT, November 20.

On view morning of Sale, and Catalogues had.

Friday Next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL by order of Mr. F. SANDER,

A GIANT CATELEYA.

GIANTIC MASSES. GIANTIC FOLDS.

GIANTIC FLOWERS. GIANTIC CONSIGNMENT.

Probably the most magnificent lot of Cattleyas ever intro-
duced into Europe.

And the only consignment that will be received.

Friday next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL by order of Mr. F. SANDER,
2,000 CATELEYA LABIATA (LINDLEY),
fine consignment just to hand.

The true old autumn-flowering Cattleya labiata from the Rio
Pinto, Swainson's hunting-ground, the only locality for the
true old plant. Re-imported by F. SANDER.
It is the Queen of Cattleyas.

It is guaranteed true.

Many plants in sheath will also be included in this sale.

Friday Next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL by order of Mr. F. SANDER,
SPATHOGLOTTIS ERICSONII,
A new and grand variety.

Friday Next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL, by order of Mr. F. SANDER,
A grand lot of
DENDROBIUM AUREUM ZELANICUM.
The true Ceylon variety. It is by far the grandest yellow
Dendrobe of the aureum section, and is a magnificent species.
It is now very rare.

Friday Next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL, by order of Mr. F. SANDER,
a fine lot of a CATELEYA found growing in the OLD
LABIATA district on the upper Rio Pinto.
The plants much resemble C. Schotteliana in appearance,
but the flowers are described as being white, while the lip is
crimson.

Friday Next, November 20.

MESSRS. PROTHEROE AND MORRIS
will SELL, by order of Mr. F. SANDER,
CYPRIPEDIUM INSIGNE, ALL UNFLOWERED.
These plants were collected from exactly the same locality
whence the lovely
CYPRIPEDIUM INSIGNE SANDERE
originated. This I guarantee.
Particular attention is called to this batch of Cypripedes.

Friday next, November 20.

MESSRS. PROTHEROE AND MORRIS will
SELL, by order of Mr. F. SANDER,
a remarkable-looking EPIDENDRUM from the old LABIATA
district;
also a fine-looking BURLINGTONIA from the same region.

Friday Next, November 20.

New Apple, Chelmsford Wonder.
SALT MARSH AND SON,
 The Nurseries, Chelmsford, are now sending out this
 splendid NEW KITCHEN APPLE, which, after receiving an
 Award of Merit in March last, has had an additional award of
 a First-class Certificate at the meeting of the Fruit Committee
 of the Royal Horticultural Society on November 10.
 It is a firm, handsome Apple, of large size, a good keeper,
 great bearer, and of superior flavour when cooked. It was
 favoured with a well executed illustration, together with a
 faithful description, in the *Gardener's Magazine* of April 11,
 copies of which may be had on application.
 Strong Maiden Trees are now ready at 5s. each, with the
 usual discount to the Trade.

Special Offers made, and Contracts drawn up, on Short Notice.

CHRYSANTHEMUMS.

Our whole aim and exertion is to grow and supply plants and cuttings in the highest possible condition, so that they succeed everywhere. It would gladden the heart of every veteran grower to see our houses filled with the finest stools, full of vigour (these were cut down six weeks ago, when out in the open ground), now throwing up the loveliest cuttings ever supplied, in perfect health and full of colour. It is really extremely important, however many cuttings exhibitors may have on their overfed exhausted plants, to have all they want for next season from our grandly-prepared stock, and 12,000 plants in pots specially prepared in the same manner for foreign transit. See following Testimonials of the great results from our importation to the furthestmost parts of the globe, and which have made us the largest exporters of these and all other plants and seeds:—

Mr. T. SPAULDING, Importer of Chrysanthemums, Orange, N.J., U.S.A., August 18, 1891.

Gentlemen.—The Chrysanthemums came to hand in fine shape; in fact, better than any ever received. I do not think I shall lose one.

Messrs. D. HAY AND SONS, Montpellier Nursery, Auckland, N.Z., September 11, 1891.

Dear Sirs.—We have very much pleasure in informing you that the plants arrived in the best possible condition. We are delighted, and thank you.

Mr. EDWIN HESKETH, Bank Buildings, Auckland, N.Z., June 20, 1891.

Dear Sirs.—I have to offer you my best thanks for the plants. They all reached me in grand condition, nothing could have been better. This will be sure to bring its reward. I shall ask your valuable assistance again.

Send for ours, the finest and most correct ILLUSTRATED and DESCRIPTIVE CATALOGUE of the best kept Collection in the World.

FRIDAY NEXT, November 20.

THE GARLAND CŒLOGYNE

Bigger and longer than
CŒLOGYNE DAYANA.
NEW VARIETY.
NEW DISCOVERY.

THE LONGEST INFLORESCENCE KNOWN.

Flower-spikes 5 feet, with nearly
100 flowers on a spike.

**CŒLOGYNE DAYANA
GRANDIS (Sander).**

THE GARLAND CŒLOGYNE,
Offered for the first time.

Collector writes, "that nothing in Nature can exceed the elegance, grace, and beauty of this Orchid, clothed with its immense long spikes. The profusion of nankeen-yellow, chocolate, and white blossoms literally hid the branches of a tree from view. Each flower $2\frac{1}{2}$ inches and more in diameter. Thirty spikes were seen on a plant, many 5 feet long."

It is an Orchid of easy culture, and Amateurs will remember the wonderfully-grown plant of Cœlogyne Dayana, with five flower-spikes, shown by Baron Schroder last year.

SPATHOGLOTTIS ERICSSONI,

New and magnificent **CATTLEYAS** and other **ORCHIDS**, probably quite new, from the Upper Rio Pinto, locality indicated in Swainson's correspondence.

MESSRS. PROTHEROE & MORRIS

Will **SELL** the above grand Consignments, at their Rooms,

67 & 68, Cheapside, on Friday Next, November 20,

By Order of

Mr. F. SANDER, ST. ALBANS.

A GIANT CATTLEYA.

Gigantic Masses,
Gigantic Bulbs,
Gigantic Flowers,
Gigantic Consignment.

This is probably the finest importation of any Cattleya ever imported into Europe, and the only consignment we shall receive.

**DENDROBIUM
AUREUM ZEYLANICUM.**

The finest golden-yellow Dendrobe of the aureum section, and a magnificent species. The true variety from Ceylon. Very extra and very rare.

2000

CATTLEYA LABIATA

(TRUE).

Fine consignment, just to hand, of the true **OLD AUTUMN-FLOWERING C. LABIATA**, from Rio Pinto, Swainson's hunting-ground, the only locality for the true old plant. Re-imported by **F. SANDER**.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 14, 1891.

CHRYSANTHEMUM SPORTS.

[A paper read at the Conference of the National Chrysanthemum Society, November 10.]

THE Secretary has done me the honour to ask me to say something about Chrysanthemum sports from the botanical point of view. I had much hesitation in acceding to his request, on the ground that I knew but little about them; but as I was aware that botanists, as a rule, are equally in the dark, I ventured to accept the responsibility, with the hope of gaining information, if I was unable to impart much of any importance.

Of course, what we all want to know is, what are the causes which bring them about? The answers to this question are at present little more than guesses, but they would be extremely valuable practically if we knew them. Thus, Dr Masters writes:—"Whoever will investigate the cause of these sudden outbursts of local variation must, of course, sedulously examine each case for himself, according to the measure of his ability and of his opportunity. The circumstances, the history, the progress, the anatomy, of each particular sport must be investigated, both absolutely, and in relation to similar outgrowths in other plants. Until this is done, and it has not been done yet, any explanation as to the cause of the phenomenon must be a matter of speculation."* The only way likely to lead to an interpretation of the origin of sports is by means of such careful observations as Dr. Masters suggests, and by experiments. Unfortunately, this is just the means which florists and practical cultivators of all sorts apparently have no time for carrying out. It requires great patience, and in the end any particular series of experiments may lead to no practical results. The experimenter must work in faith, and be in nowise disheartened if no result immediately follow. However, it often happens that while one is investigating with one end in view, something quite unexpectedly turns up, which may prove to be of great practical value in some quite different way. For example, while experimenting at Chiswick on the Jensenian method of moulding-up Potatos, in order to protect the tubers from the spores of the *Phytophthora*, the confirmation was furnished that whole Potatos used as seed gave vastly better results as a crop than when cut portions were employed.

With reference to our special subject to-day, such observations as have been recorded upon the appearance of sports in Chrysanthemums are suggestive of one or two practical questions, which may or may not be useful, which I will mention as occasion requires.

* Bad Variations or Sports, *Gardeners' Chronicle*, January 10, 17, 24, and February 21, 1891.

Chrysanthemum sports may be grouped under the two heads of Colour and Form. First, with regard to colours. Botanists are pretty well agreed in their belief that yellow was the primitive colour of true flowers, which were first evolved in the missing links between Gymnosperms, *i.e.*, Firs and their allies, and Angiosperms, which includes all other flowering plants. When, therefore, a coloured or white Chrysanthemum sports to yellow, which is frequently the case, it may be regarded as a reversion to the typical or original colour indicated by the name Chrysanthemum or Golden-flower. Hence, it is not surprising to find such reversions to be common; but Mr. Davis remarks that a yellow never sports to a white.*

The nearest approach to this that I am acquainted with, is Madame Desgranges (introduced by Mr. Ware in 1882). The flowers open of a sulphur colour, but change to pure or nearly pure white.†

Another writer, Mr. Forsyth, states:—"It appears that Lilac flowers are the most sportive, and that they frequently change to yellow . . . also that nearly all the colours are capable of sporting into white . . . It may be pretty safely said that any colour is capable of sporting to any other colour that is within the range of colours proper to the Chrysanthemum."

Similar experiences were met with abroad. M. Carrière records the fact that in 1864 the white-flowered Vesta produced yellow flowers. In 1856, Surprise, with rosy flesh-coloured flowers sported to a deep rosy-lilac called Gain of the Museum. He also mentions that in 1862, this sport bore on one branch pure white flowers, on another flowers which were half-rose and half-white. Both varieties were permanently retained by budding. This last case is interesting, as it has been thought that such sports as the last mentioned could not be fixed.

A white variety may be called a lapse from some coloured condition. The power to reproduce the colour may often, perhaps always, in white varieties raised by cultivation, be retained in the blood, so to say; so that, it is not surprising as a rule, to find seedlings from white varieties of many kinds of flowers in general, to revert to the parent colour, or else be very various in their tints.

Besides seedlings, a whole plant may suddenly lose the colour of its flowers by transplantation, and appear white-flowered in the next season. Thus, blue Violets transferred from the Isle of Wight to a bed of red sand in Sussex, became white in the following year. In two years' time, however, they reverted to blue again. As another instance, a white variety of the Everlasting Pea was transplanted from one garden in St. Albans to another, in which it permanently reverted to the common red type. *Orchis pyramidalis* is very common in Malta, and has white flowers till May; those that subsequently open are red. Lastly, a blue-flowered Hydrangea, growing at Southampton, became red when transported to Bedford.

As instances in Chrysanthemum sports, it will be sufficient to add the case of Cedo Nalli (white), which gave rise to yellow, lilac, brown, and white sports; while Queen of England (blush) has sported into six different colours, as well as white, namely, two golds, two bronzes, a rose, and a primrose.

Regarding yellow as the primitive colour, and white as the neutralisation of all colour, we can understand how any other may revert to yellow, and all may lapse into white.

Now, the colours of flowers are due to chemical substances, which are, in the main, undoubtedly organised products—*i.e.*, made by the plant itself.

Nevertheless, as high or low nutrition, prolonged and clear sunlight, as well as temperatures, have marked influences upon the colours of flowers, if he cannot alter the sunlight, the florist has one means, at least, at his disposal—namely, the ingredients of the soil.

As an example of marked atmospheric influences is the well-known fact of the greater brilliancy of flowers in high latitudes and altitudes. MM. Bonnier and Flabault have shown that this is indirectly due to the enhanced assimilative powers of the foliage in consequence of the prolonged sunlight, by means of which the flower-making and flower-colouring materials are increased.

Oxidisation under the action of light has been thought to be another cause of change in colour, as in the case of the changeable Hibiscus, which is white in the morning, pink at noon, and bright red by sundown. Again, a species of Phlox with pink flowers, is of a light blue colour at first at 5 A.M., but by 9 or 10 A.M. acquires its proper colour. The clump which catches the sun's rays first being the first to change, as is also the case with Chrysanthemums. Thus one of the early varieties, called the Changeable Bull, introduced by Reeves in 1824, commences yellow, but passes into a pinky-orange as the flower expands. Again, the magnificent Etoile de Lyon bears two kinds of flowers, the crown or single buds being nearly a pure white, while terminal buds are described as a lilac-rose. One cannot as yet assign any definite cause to account for these differences, but can only suggest that they may be due to some obscure differences in nutrition.

Mr. Lowe describes Titania as a sport from the white Pompon Modèle. It has blooms which are white at first, and then become pink, with the centre of the bloom remaining white.* Again, Mr. Buss speaks of Lady Dorothy as being of a pretty tint of fawn flushed with pink. When grown for late flowering, and with all its flower buds left on, it comes more of a yellow colour than fawn, apparently indicating a tendency to reversion.

That climatal conditions, over which one has no control, may bring about sports has been suspected, from the well-known fact that sports often appear simultaneously at various places and in the same season. Thus, the lilac-purple Baronne de Prailley threw a fine brownish-orange sport (Carew Underwood) at two or three places simultaneously, and in the same form.† Mr. Molyneux supplies another illustration, in the case of Boule d'Or, which produced a chestnut-coloured sport both in Hants and Lancashire.

The suggestion at once arises that such simultaneous sporting may sometimes, at least, be due to the common practice of florists "sending out" a large batch of a new variety, all over the country and abroad, in one season. And, if such individual plants sported immediately afterwards, one might suspect that the power was inherent in the parent from which all the cuttings sent out had been derived; but as Mr. Davis observes, "a variety may pass many years without showing any inclination to sport, and then, all at once, sports appear in all directions."‡ When such is the case, the above idea seems to be negatived. So that this fact certainly suggests the sport to be due to some climatal conditions prevailing uniformly over the various districts where the sports occurred.

It has also been observed by Mr. Payne that nearly all the early imported varieties from China were much more inclined to sport than the majority of those since raised from seed. The old purple, the expanded light purple, the quilled light purple, the curled lilac, and the buff, seem to have been those most sportive in olden times.

Now, if the above facts warrant one in regarding climate as an inciter to sporting, we have an obvious means of encouraging, if not of actually producing them, by frequently introducing plants from as different a climate as possible from our own—say, Jersey, Portugal, South of France, Italy, and America, in which countries our more stable sorts

will, perhaps, reward the florists of those countries by sporting with them in return.

I remarked that the colours of flowers are due to chemical substances organised by the plant itself; and Professor Sachs has come to the conclusion that it is the ultra violet rays of the solar spectrum which have some special power in making flower-substances. We know very little about these particular rays in their relation to plant life; but judging from the fact that flowers so often fail to be produced in even very moderate shade, coupled with the intensity of colours in high alpine flowers, which enjoy a clear uninterrupted atmosphere, we can at once realise the importance of bright and prolonged sunlight. It must be remembered, however, that light itself has little to do with the actual making of the flowers. This depends entirely on the foliage; so that for fine flowers you must see that the foliage can do its work to perfection; especially that the surface of the leaf is not begrimed with soot, &c., but well cleansed, if necessary, with soap-and-water. G. Henslow, M.A., F.L.S.

(To be continued.)

NEW OR NOTEWORTHY PLANT.

NERINE PANCRATIODES, Baker, n. sp.*

This is a very distinct and interesting new species of Nerine, which has just been imported from Natal by Mr. James O'Brien. The structural peculiarity which it shows, is having small square bifid scales between each of the filaments, as in *Coburgia* or *Pancratium*. It is this peculiarity which has suggested the specific name. Its horticultural characters are middle-sized, pure white flowers, with uncrisped segments, and very slender, nearly terete leaves. My description is taken from material kindly sent by Mr. R. A. Todd, of Honeyden, Foot's Cray.

Leaves contemporary with the flowers, bright green, 15 to 18 inches long, $\frac{1}{10}$ to $\frac{1}{12}$ inch diameter, subterete in the lower half, nearly flattened towards the tip, glabrous. Scape robust, 2 feet long. Umbel 12 to 20-flowered, centripetal; spathe-valves two, small, lanceolate; pedicels stiffly erect, very pubescent, 1 to $1\frac{1}{2}$ inch long. Perianth pure white, $\frac{3}{4}$ to 1 inch long; segments oblanceolate, not crisp, $\frac{1}{4}$ inch broad. Stamens scarcely half as long as the perianth, slightly declinate; filaments tinged pink, alternating with bifid square scales; anthers small, oblong, black. Ovary $\frac{1}{8}$ inch diameter, pubescent, deeply 3 lobed. Style very short when the anthers are bursting J. G. Baker.

THE "JAM CROP" OF 1891.

INTERESTING and profitable as are the tables annually published in these pages in connection with the fruit crops of Great Britain and Ireland, they would probably be of still greater value could they be supplemented by such returns as that noted above, the "jam crop;" but, to obtain these, manufacturers would have to be consulted, and we are very well aware that most of them object to the publication of that, which, as they put it, "the benefit of which to themselves they do not see." Perhaps they are right—possibly they are wrong; at any rate, what we have termed the jam crop of the present year must be a very large one, and in humble life will run margarine very closely in the race for economic food supply. The taste is a growing one, and extends with the population. London adds 60,000 souls to its great total every year: given four in a family, then $60,000 \div 4 = 15,000$ families. Suppose these consume 1 lb. of jam per

* *Nerine pancratioides*, Baker, n. sp.—Folius synanthus sesquipedalibus viridibus angustissimis dorsum subteretibus sursum subplanis; scapo robusto bipedali; umbellis centripetalibus 12–20 floris; spathe valvis parvis lanceolatis; pedicellis longis strictis dense pubescentibus; perianthio albo submetallicis segmentis oblanceolatis planis; staminibus perianthio duplo brevioribus, antheris parvis oblongis nigris, filamentis squamis quadratis bifidis alternantibus; stylo brevi.

* *Gardeners' Chronicle*, January 12, 1889.

† See the above was written, Mr. Owen informs me he has experienced this exceptional phenomenon.

‡ *Gardeners' Magazine*, April 20, 1872.

* *Gardeners' Chronicle*, 1873, p. 242.

† R. D., *Gardeners' Chronicle*, December 7, 1889, p. 656.

‡ *Gardeners' Chronicle*, 1889, p. 40.

week, then the consumption for the twelvemonth is represented by 785,000 lb. = (say) 350 tons per annum. The consumption per week for each family is admittedly low—but even at this figure what an enormous mass of wholesome sweetness must enter into the food bill of 5,000,000 men, women, and children—a million and a quarter one pound jars per week, or, roughly 625,000 tons a year! You can do much with figures. Quite an enormous sale of "bread and jam" made in all the busy quarters of London—in the immediate neighbourhood of factories and workshops. The keeper of one little "general" shop informed the

persons, young and old, for various terms; and have used nearly 58,000 glass bottles and jars in getting this jam ready for market. How the genial countenance of the once-famous tenant of Tiptree Hall, "Alderman and Sheriff" Meehi, would brighten at such an enumeration as this, and how he would have lectured his brother agriculturists on jam as his theme! But not only this "sweetness" is manufactured by this young and enterprising company; as with nearly all other fruit preservers, some dozen other commodities are put upon the market—not all the eggs being put in one basket. But it would be waste of space to occupy attention further with this

Its flowers are "of one uniform purple tinged with violet, with some rich crimson veins on the lip. . . . The excessive lobing of the petals and lip, and the comparatively small size of the latter," distinguish it from *Cattleya labiata*. Ten years after its first publication, Reichenbach described the same plant under the name of *Lælia Boothiana*, it has also been known as *L. Rivieri* of Carrière, and as *Bletia Boothiana*; whilst in Messrs. Veitch's indispensable *Manual*, from which we take some of these particulars, it is named *Lælia lobata*. Messrs. Veitch tells us that it grows in the neighbourhood of Rio, high up on a bare rock facing the sea, and in full sunshine from morning till night, a fact of which cultivators should take note, as this species, though often growing vigorously under the usual cultural treatment of *Cattleyas* and *Lælias*, often fails to flower. Messrs. Veitch consider it to be a near ally of *L. crispata*. Its season of blooming is April and May.

FIG. 78.—*LÆLIA BOOTHIANA*: FLOWERS, PURPLE.

writer the other day that she sold over 500 slices of jam every day—there were plenty of margarine slices as well, but the "jam" was preferred. It would appear then that the supply can hardly be overdone—as yet, and the amount of labour called into use in the manufacture and marketing is very great. There are the regular field and orchard workers, those concerned in harvesting and manufacturing, in the manufacture of glass and earthenware bottles and jars, in fancy printing and packing-cases, and in a lot of other industries. Here is a little item worth noting, as giving point to our remarks all round. The Britannia Fruit Preserving Company at the world-renowned Tiptree, in Essex, have this year harvested over 200 tons of fruit—have made 100 tons of jam, in which they have used 50 tons of sugar; in producing all this have employed 400

matter at present; the reader, landowner, grower, manufacturer, speculator, vendor—whichever he may be—can readily read for himself the lesson sought to be inculcated by us in thus noting the "jam crop" of the present year.

LÆLIA BOOTHIANA.

Now that the Orchidic world is excited over the re-discovery of the long-lost *Cattleya labiata*, it may be of interest to call attention to another Brazilian form which is evidently allied to the true *labiata*, though technically a *Lælia*, and which is nearly as great a stranger to our collections as that species was until lately. The plant was originally introduced in 1840 from Brazil by Messrs. Loddiges, and described by Lindley as *Cattleya lobata*.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM AT ST. ALBANS.

ONE hundred and fifty spikes of flowers of this plant are now to be seen at Messrs. F. Sander & Co.'s, and they make a brave show. The flowering specimens of this coveted plant previously in the country might be counted on the fingers of one hand; yet a large number of them may now be seen arranged with other choice and showy Orchids in one of the long houses. As was indicated by the life-sized drawing shown when the plant was offered for sale at Messrs. Protheroe & Morris' Rooms, there is a great range of colour in the blooms of this species, and even the flowers of the first batch of plants exceed the promise in this direction, for the Elephant Moth *Dendrobium* exhibits as much variation as even the favourite *Odontoglossum Alexandræ*, and, like it, it will probably have a long run of popularity.

First, it may be as well to say that it proves to be the true plant, and not *D. P. Statterianum*, which always has narrower sepals, narrower and longer lip, devoid of that broad square formation at the upper part of the front lobe; indeed, there are characters so well marked as to render the two botanically distinct. The rich sprays of this plant represent it in every shade and combination, from white to dark crimson, and always in such beauty as to render the task of selecting the best variety a difficult matter. Here is the typical rosy-petalled form of Baron Schroder's original plant, and beside it a still richer coloured form with fifteen flowers on a spike; and glancing along the bank a few of the leading types may be selected. The first to catch the eye is a large pure white form, the only colour which can be observed on closer inspection being some delicate pink veining in the lip; this will be one of the cardinal types. Then comes a delicate variety, with blush sepals and blush petals, veined with rose, and a rose-coloured lip, with crimson centre, the crimson extending in delicately-traced lines to the front lobe of the lip; passing on we find one with flowers richly coloured all over, calling to mind the colours of a fine *Cattleya Bowringiana*, and then we find in contrast a large-flowered form which may be called a pure white, with only the outer halves of the segments delicately tinged with pale lilac. Another has white sepals marbled with rose, and bright rosy-crimson petals with dark crimson lip. One of the prettiest has very delicate white flowers with a pale rose-flush over them; and, indeed, although there are some highly-coloured forms, it is likely that the light and white varieties will be the favourites—but where there is such a wide range all tastes will be satisfied. The plant increases very freely, so much so, that the supposed eyeless pieces, set aside when the importation was unpacked, are now breaking freely along the pseudobulbs, after the manner which seems to be habitual to it.

With the above-mentioned also came, as a single

specimen it is feared, another new Dendrobe, which is now flowering at St. Albans. It is a very beautiful species, with pseudobulbs about 3 feet, and elegant sprays of flowers, each about 2 inches across. The sepals are like those of *D. phalaenopsis*, white freckled with rose. The petals, which are as narrow as the sepals, are bright rosy crimson, the handsomely-formed lip greenish at the base, and with the front and side lobes of a rich rosy-crimson, and down the lip runs several very distinct wavy ridges. It is a very handsome species.

Also arranged with the new Dendrobe, the whole forming a splendid sight, may be mentioned a specimen of the beautiful *Cymbidium cyperifolium*, a very rare species, with yellowish sepals and petals lined with reddish-brown, and a large pure white lip, with purple lines on the side lobes, and purple spots on the front. Flowering also for the first time are many plants of a new form of *Calanthe vestita*, with the stout habit of *C. v. gigantea*, or *igneo-oculata*, but with flowers $2\frac{1}{2}$ inches across, pure white, with lemon-yellow eye, very distinct, and a grand flower for cutting. The St. Albans importation of *Vanda coerulesa* is also producing some fine things, which are very effective in the display. One is probably the best and richest-coloured variety yet flowered. Its flowers are large, and nearly circular, dark blue, closely chequered, and with only white spotting showing through, and the reverse side of the flower is as richly coloured as the front. Among their importation of *Cypripedium insignemontanum* many fine things have flowered, and at present there are four quite distinct, and these, with some plants of the showy *C. Maynardii superbum* ×, some good *C. Spicerianum*, among which the form that Mr. Sander distributed as *C. S. magnificum*, is the best. The new and distinct *C. Malyanum* ×, a very singular and pretty form of *C. Lecanum* ×, and other *Cypripediums* aid the show, together with some *Lycastes*, white and coloured, and many other handsome things. In their quarters, suspended over the rock, are some scores of specimens of the white form of *Laelia anceps*, covered with spikes.

CATLEYA LABIATA, Lindl.

A collector of Messrs. F. Sander & Co., of St. Albans, has sent home some well-dried flowers from the locality whence the recent importations have been sent, one of which has been presented to Kew, and the others I have examined. They are precisely identical with those which have been mentioned in these columns on several occasions recently, and it is therefore evident that this useful autumn-flowering *Cattleya* will soon be as common in cultivation as formerly it was rare. Viewed in the light of recent events, one cannot cease from wondering how it has eluded the search of so many collectors for so long a period. *R. A. R.*

ORCHIDS AT BLETCHLEY PARK.

While in the district of Bletchley a week or two ago, I made a special visit to Bletchley Park, the magnificent country seat of H. Leon, Esq., M.P. Through the kindness of the gardener, Mr. Hyslop, I was permitted to inspect the collection of plants. As I have a weakness for Orchids, my attention was naturally directed to these plants in a special degree. We are all well aware that the present season of the year is a dull one for Orchid bloom, and, what with the boisterous weather to which we have been subjected of late, it renders it doubly hard to get anything like a good display. I was not disappointed by any means, and what I saw I was delighted with, because it was of a fine quality. My attention was specially fixed on a batch of *Cattleya Dowiana aurea*, several of which were in flower; most gardeners will agree with me, I fancy, when I say that this Orchid is by no means an easy one to flower, it is so much apt to run away into new growth as soon as a bulb is completed. Mr. Hyslop has devised artificial means, however (which he imparted to me as a secret, and which I am consequently bound to respect as such), to make the

plants flower regularly every season. The process by no means injures the plants; on the contrary, it has a tendency to strengthen them, and make them produce flowers of much finer quality than any I have hitherto seen. The colour, form, and marking of these flowers were superb, and I have one of them on the table now as I write, though cut fourteen days ago. Mr. Hyslop is particularly successful with his *Cattleyas*, and I saw several good forms of *Cattleya Gaskelliana* flowering at this late period. A fine collection of *Cypripedium insigne* cannot fail to attract a good deal of notice; there are several huge specimens about 3 feet in diameter, and each one literally covered with unexpanded buds, and giving promise of a very fine display when fully expanded. Some people are fortunate in getting cheap Orchids, Mr. Hyslop informs me that he got all those lovely *Cypripedes* for the proverbial "old song." There is a fine healthy lot of *Odontoglossums* in a cool house—they grow well here, and flower regularly; broad flat growths are to be seen on these plants, indicating vigour and distinctness. *Dendrobiums* are also well looked after, and many fine specimens of *D. Wardianum*, *crassinode*, *nobile*, and more rare varieties, are now undergoing the ripening process preparatory to flowering. A very good form of *Cypripedium Curtisii* is in this collection; it is particularly well marked, and the petals are quite pendulous, and almost fold themselves around the base of the pouch; a distinction not often met with. Mr. Hyslop has effected many interesting crosses among his Orchids, and we must not be surprised if the Orchid world will be shortly startled by some of the wonders of Bletchley Park. Much could be written on the fruit garden and arboretum, but that I will leave to his experienced hands. *Weathercock.*

THE STRUGGLE FOR LIFE IN THE GUIANAN FOREST.

ORCHIDS AT HOME.—Far above our heads are the representatives of Shakespeare's "long purples" and the other temperate Orchids which decorate the English meadows. There they sit, 100 to 150 feet above our heads, "born to blush unseen," as far as the human eye is concerned. Nevertheless they live, and perhaps enjoy life, doing their work, and doing it admirably. They do not elbow their neighbours, nor do they smother, strangle, or suck them, but simply make use of the topmost branches of the forest giants, as resting places. The Orchid grasps its support in a loving manner, holding it tightly, but not like the parasite, to get fat at its expense. No, the Orchid has succeeded in making itself almost independent. It is satisfied with a little light; so there is no necessity for interfering with its host. Having as it were, succeeded in getting out of the turmoil of the fight, it decorates the brawny limbs of the forest giant with its brilliant flowers, and invites the bees and butterflies to come to its nuptials.

Although it apparently takes things very easy, the Orchid is by no means idle, while its position to-day represents the outcome of generations of steady work. Having no connection with the soil, it has to gather its food from the air, rain, and dew, and not only to collect, but also to store it. Although rains are frequent enough, still there are dry seasons, when, under the tropical heat, a plant in such a position must wither and die, unless some provision were made for these contingencies. Like the plants of the desert, the Orchid stores its food in anticipation of a drought; but every family, and almost every species, do this in a different manner. Some, like *Oncidium lanceanum*, lay up their store in thick leathery leaves, so that they can enjoy plenty of sunlight without injury. Others, like the *Cattleya*, have thick leaves and a swollen stem, which latter is one of the forms of the pseudo-bulb, and is peculiar to the Orchid family. Where the leaves are thin the pseudo-bulbs are often very large, so that if every leaf should be dried up, the plant still retains its vitality. In some cases the store of food is laid up in cylindrical leaves, some resembling porcupine's quills, others like yard lengths of thick twine; in

others there is a plump fleshy stem, which answers the same purpose. A few species have no leaves or pseudo-bulbs; in such cases, their aerial roots perform all the functions of both.

Beyond the fringe of rampant vegetation, nothing can be seen from the river, but by pushing aside the branches and Creepers, so as to get behind the veil, Orchids may be seen growing luxuriantly in great numbers. Here live those species that delight in plenty of moisture, and that cannot endure the drier atmosphere which is met with in the "high woods." This is the home of *Zygopetalum rostratum*, which is enabled to flourish and produce its beautiful white flowers in more gloomy recesses than most of the others. It has developed a creeping habit, by which it seems to derive benefit, being able by this means to grow upwards on a branch as the tree extends itself. When this species is plentiful, it forms quite a pretty decoration to the rugged branches.

The places where Orchids are seen to advantage are not, however, on the banks of the great rivers, but rather on those that are wide enough to allow a moderate quantity of light to penetrate. Not having sufficient sunlight to produce rampant vegetation, such places are very congenial to a great number of species. High above the water rise the giant Moras and other immense timber trees, while here and there a great trunk leans across the creek, its upper surface decorated with creeping Ferns, *Peperomias*, and the smaller species of Orchids, such as *Pleurothallis* and *Dichaea*. In some of the larger forks, grow immense masses of *Oncidium altissimum*—often 3 or 4 feet across—their elegant flower-stems being 10 or 12 feet high, hanging or curving gracefully over, and loaded with hundreds of pretty yellow flowers. *Brassias* are also very common, while here and there *Stauhepa eburnea* perfumes the air with its large ivory-white pendulous blossoms. As the creek twists and turns about, a new vista is opened at intervals, every short reach, from the different degrees of light, showing some diversity in its forms of vegetation. Now, as the creek narrows, the canoe is paddled through a gloomy cavern almost as dark as night, from which the exit appears at a distance like the termination of a tunnel. Then comes a wide bay, where the sun shines in all its brilliancy. Here a mass of vegetation chokes the passage, and the cutlass has to be used freely; while, a little further, a forest tree has fallen right across the stream, giving, perhaps, an hour's hard work with the axe before the canoe can be pushed through, hauled over, or drawn under.

On leaning trunks or projecting branches the *Catasetums* are generally plentiful. There are several species, which live under entirely different conditions, and taken altogether, this genus is perhaps the best example of adaptation to circumstances in the Orchid family. On the borders of the swamps, where only the *Eta Palm* will grow, *Catasetum longifolium* finds a congenial home among its lower fronds. There the Orchid hangs downward, and waves its long grass-like leaves in the wind. *Catasetum discolor*, as a contrast, has come down to the ground, and on the sand-reef, where the forest trees find it hard to live, this species revels in the poorest soil. Being provided with large pseudo-bulbs, the *Catasetum* endures the change of seasons without injury. Although its leaves are generally thin, and are liable to be dried up during a drought, this does not injure it, as the reservoir of food enables it to wait patiently, and even flower, under such conditions as might be fatal to many other Orchids. As if this were not enough, several species have developed a faculty which is almost unique in plants, although well-known in the case of bees, that of producing male or female according to circumstances. In the case of *Catasetum tridentatum*, there are three distinct shapes of flowers, which differ so much from each other that, until Schomburgk found them growing on the same plant, they were described not only as separate species, but even different genera. The male was known as *Myanthis barbatus*, the female as *Monachanthus viridia*; while the third form, which appears to be hermaphrodite, went by what is now the name

of the species, *Catasetum tridentatum*. When this plant has plenty of food, it produces a spike of female or hermaphrodite flowers, which are thick and fleshy, resembling in shape an old-fashioned woman's cap or sun-bonnet. These flowers and their attendant capsules, require a special effort, and can only be satisfactorily produced when the plant is in good condition. During a drought, when the plant is half-starved, it would be unable to support such a strain, therefore a few lighter and more elegant male flowers are produced, and as there will always be some stronger plants able to produce those of the opposite sex, the work of the weaker is not lost.

If one passes under one of these plants, when in flower, a swarm of yellow and black bumble bees (*Eulema dimidiata*) are seen hovering in its neighbourhood, and flying from flower to flower. Except in this locality, not a single bee is to be seen, and perhaps a collector might search for miles without

means of a sticky disk, with which they are provided, they adhere to the back of the insect, and are carried to another flower. Here the pollen masses come in contact with the stigma, and the flower is fertilised.

Hanging from a Creeper or branch may be seen here and there an oval bag-like mass of aerial roots, something like one of the nests of the tropicinals so common on the silk-cotton tree, above which are the pseudo-bulbs and leaves of that wonderful Orchid the *Coryanthes*. After throwing out two or three roots to attach itself to its support, it develops an interlacing network all round, in a way almost peculiar to the genus. At first sight it would be hard to say what purpose could be served by such a contrivance, but strike or shake the plant and it will be seen that it is nothing less than a veritable ant's nest. The Orchid is, like other plants, subject to the attacks of many foes, such as cockroaches and larvæ, which are particularly fond of the aerial

FIG. 79.—RIPENING STAGES FOR IRIS IN PROFESSOR M. FOSTER'S GARDEN, SHEFFORD.

finding a specimen. But when the *Catasetum* opens, whether it is hidden in the fork of a tree, perched far up among the foliage of the *Éta*, or on sand thrown up from a charcoal pit, the insect is sure to find it out. The flowers are not generally brilliant or showy, neither have they, like the *Stanhopeas*, any strong perfume, but, nevertheless, the bees discover them at once. Even in Georgetown, where many Orchids do not find their fertilising agents, and consequently remain barren, no sooner does the spike of flowers open, than the bees swarm around it. However it may be obstructed by foliage, or hidden in some out-of-the-way corner, the buzzing is heard in the early morning, telling anyone who has his eyes open that a *Catasetum* is flowering. Having succeeded in attracting the bee from a distance in some unaccountable way, a feast is provided in the shape of a little reservoir of nectar, to procure a sip of which the bee has to bring its head in contact with a pair of incurved antennæ, one of which is very sensitive. Immediately on touching this, the cover of the little case containing the pollen-masses flies off, and, like a skip-jack, these spring out, when, by

roots. To protect itself against these, the *Coryanthes* has chosen to provide a comfortable nest wherein a garrison of carnivorous ants find shelter, they, in return for the accommodation being ready to come out and fight at the first alarm of an enemy. Other Orchids, which live in the tree tops, are not so subject to crawling insects as those nearer the ground, and for that reason it appears that they have never seen the necessity for this special protection. *Epidendrum* (*Diacrium*) *bicornutum* has obviously felt this need, and set to work in its own way to accommodate a garrison. Being provided with long cylindrical pseudo-bulbs, it has left these hollow, and, for a doorway, allowed the shell to split for about a quarter of an inch at the base. In these well-protected homes the ants live and thrive, and in return for their lodging, like those of the *Coryanthes*, are a standing terror to evil-doers. Other Orchids, such as *Gongora*, provide a half-shelter for ants, but their efforts in that way are of little importance as compared with *Coryanthes* and *Diacrium*. *James Rodway, F.L.S., in "Timber."*

(To be continued.)

VIEWS IN PROF. M. FOSTER'S GARDEN, THE NINE WELLS.

IN vol. vi, u.s., p. 5, of the *Gardeners' Chronicle*, will be found a short description of Prof. Foster's garden at Shelford, near Cambridge, and the illustrations on this and page 585, will supply readers of the *Gardeners' Chronicle* with further information relating to the garden of this devoted cultivator of the family Iridæ. Visitors to The Nine Wells must not expect to find the Irises grouped altogether, but to find here a terrace and there an enclosed spot containing many rare and scarce species and varieties. The view (fig. 79) where the lights are shown, represents one of these sheltered spots, and the lights have been placed over those which have gone out of flower, so that they may be protected from wet, and thoroughly ripened; and to this system the Professor claims that he owes no small share of his success in growing and flowering many of the choicer and shy blooming Irises. No man, perhaps, knows more of the details of the genus *Iris* than Prof. Foster, and if he could but be induced to give a few articles in these pages upon his experience in cultivating these lovely flowers, it could have no other effect than assisting to make the family more generally cultivated than is the case at the present time.

There is one drawback in ordering plants of a certain species from a catalogue, as some of them possess so many varieties of all grades of quality; the consequence is, that a person might see some kind at an exhibition or elsewhere of particular merit, and order the same from his nurserymen, which would turn out, when in flower, altogether different, and perhaps inferior, to the one he based his purchase upon.

The Professor in some parts of his garden can point out variety after variety of the same species, some with great merit, and others much removed from the standard of perfection. The unfortunate point is, that *Iris* cultivation has not become so popular as that of *Narcissus* or *Orchids*, where, as soon as one deviates from another, we get a name of some kind to distinguish the variety.

Last summer *Iris Gatesi* was flowering in these gardens. This is one of those flowers which one only needs to see and a craving to possess it is at once induced. *I. Iberia* was also in flower, and this species one does not often have the pleasure of seeing in bloom. Upon enquiry, I was told that the former is not so free a flowerer as the latter.

The gardens are not wholly devoted to the *Iris*, but the visitor will find many choice rock plants, as will be seen in the photograph showing the house (fig. 80), and many other fine herbaceous plants in the borders.

Professor Foster gives a good piece of advice to all who manage gardens. "The first thing," says he, "that a gardener requires to find out, is what his garden will grow, and be content with it." It is impossible to visit these gardens, go when you may, without finding something in flower to greet one's senses.

In speaking of *Iris* seeds and sowing, he is particular in impressing upon the tyro the virtue of patience; as for example, he says "that he received from Persia some seeds of *Iris* in 1884, and the first year after sowing, one seed germinated (which a greedy slug devoured), and in the year 1890 he was rewarded for his patience by six other seeds germinating." *W. Harrou, Sheffield Botanic Garden.*

THE BRITISH FRUIT GROWERS' ASSOCIATION.

(Continued from p. 455.)

THE PHILOSOPHY OF PRUNING.—This was the substance of an address by Mr. J. Wright.

Mr. Wright did not prepare a paper, but spoke from short notes, making reference to a number of diagrams, and thus taught through the eye as well as the ear.—He said he was aware he had amongst his audience men as capable as himself in growing and pruning fruit trees; some of them could, no doubt, teach him something on the subject, and he should

be at least as pleased to learn from them as he was willing to try and teach others who had less education in the school of experience. Hundreds, indeed thousands, of persons were endeavouring to grow their own fruit, and all would wish them success. They needed instruction in pruning fruit trees and bushes, as did many young men who had taken the charge of gardens after gaining most of their experience under glass.

After describing the objects of pruning, namely, the production of fruitful trees in required forms adapted to certain positions, also the different kinds of pruning—summer and winter, root and branch—the lecturer said that both symmetrical garden trees, also informal standards and dwarf bushes, could be made essentially fruitful in character. They could not be made to bear full crops of fruit unfaithfully, because gardeners could not control the weather and prevent frost destroying the blossom; but if the trees were brought into the best condition of fruitfulness by correct management and methods of pruning, those who had brought them into that state had done their duty. Fruitful examples were shown in diagrams of the different forms of trees—pyramid and bush—from sketches made at Chiswick, and a thrifty, fruitful, open standard, as grown at Cardiff Castle, the methods of pruning adopted in producing such trees being shown in each case.

Crowding trees with a thicket of growths in summer to be cut out in winter, a too common habit, was strongly condemned. A sturdy framework was advocated by shortening the branches of young trees for two or three years, then having the main branches so thinly disposed that the sun should shine between them, and directly on the leaves, not near the tips of the shoots only, for that was of small service, but on the leaves near the base, for rendering them structurally perfect for performing their important functions of [forming and] storing nutrient matter in the stems, and so becoming spur and blossom formers and fruit manufacturers. With healthy root action in good soil, a due balance of force between roots and branches, leaves of the best character by the direct action of light and air on their surfaces, blossom-buds were bound to form and fruit to follow, weather being favourable to its setting and development.

Particular attention was asked to the following statement:—"No matter what kind of trees were in question—restricted and formal, or large and free—all pruning must be based on this fundamental fact—namely, the roots of a tree are part of the stem, the hidden counterparts of the visible branches, and one part cannot be manipulated—weakened or strengthened—without influencing the other." "That," he went on to say, "is the concrete condition on which all action in pruning must be based. The cultivator must not induce by mistaken practice a great preponderating power of roots over branches or branches over roots; he should, in fact, regard roots as what they are—underground stems, and be able to form a clear conception of the parts of a tree within the ground from a critical inspection of the parts above it, shoots and leaves; and until a man can do that he cannot be regarded as a competent safe, profitable pruner." The lecturer said he had found that a large number of successful fruit growers were distinctly of opinion that as much fruit was prevented by the abuse of the knife as was produced by its use, but he did not call that pruning but butchering. "A butcher," he said, "can cut off limbs, and destroy life in doing so; a surgeon amputates and prolongs life by the operation. The butcher's work is physical mainly, the surgeon's intellectual, scientific; and we want intellectual pruning in gardens, not butchering; producers of fruitful trees, not preventers of crops of fruit."

Right and wrong methods of pruning were illustrated; roots were shown as influenced by branch growth, and *vice versa*; both fruitless and fruitful wood were portrayed; the causes that produced certain effects demonstrated, and remedies for obvious evils pointed out. Waste of material was made clear in the form of a dense thicket of summer growths, rampant roots and no fruit on one side of

a tree; spur formation, fruit production with corresponding fibrous roots on the other—the latter the natural outcome of rational pruning. This, it was stated, "consists in disbudding and thinning to prevent overcrowding instead of shortening branches, yet letting the roots extend to create it, encouraging the roots of weakly trees and shortening the branches to promote necessary vigour; but when trees grow too luxuriantly in summer, cutting back the shoots in winter is simply followed by more and stronger growths. It is a case of man fighting against Nature, and the combat may go on for a generation, Nature inevitably winning in forcing growth. If man must conquer, he must use his brains and change his tactics. The branches of a strong-rooted tree, if kept thin and not shortened, will in time counteract the root power, form blossom-buds, and bear fruit, weather permitting; but if for special reasons the growth must be arrested and restricted within certain bounds, the roots must be shortened to a greater extent than the branches, especially strong roots that strike deep down in the subsoil; then, with otherwise good cultural attention, trees hitherto practically barren will produce valuable crops of fruit."

APPLE SCAB.

FUSICLADIUM DENDRITICUM.—The fungus appears to be retarded by the heat of summer. Its most rapid growth takes place during moist, cool weather, such as we have had prevailing for a long time. On the treatment of this pest the report in question states:—"The fungus of the Apple scab does not penetrate into the tissues of the host, and very early in its development it is wholly exposed to any application which may be made to destroy it. It appears, however, that the vegetative portion, or plant body, of this as well as of many other fungi, is very resistant to the action of chemical reagents, quite as much, or more so, than are the tissues of the leaf or Apple upon which it grows. We can scarcely hope, therefore, to accomplish its destruction, unless it be the growths infesting the young shoots and the scales of buds. Before the latter expand in the spring, much stronger solutions can be applied than it is possible to use later in the season, and it is at this period that the warfare against this fungus should begin. It has been observed that the germination of the spores is wholly prevented in very dilute solutions of copper, and our chief dependence in combating this disease appears to rest upon this fact—the possibility of preventing the germination of the spores where they can do harm. A practical treatment has been discovered by which we may prevent the germination of the spores of the downy mildew of the Grape Vine, by applying various solutions of sulphate of copper to the surface of the leaves upon which the spores of the fungus fall. It is doubtless equally practical to accomplish by a similar treatment a like result in the case of the Fusicladium of the Apple. Experiments already made with the sulphate of copper solutions indicate that they will, when properly applied, at once check the 'scab.' Farther and more systematically-conducted experiments are required in order to determine what preparation is most efficacious, at what season it is best to make the application, and the strength to which the solutions must be limited. Where *eau celeste*, prepared according to the original formula, has been tried, it has severely burned and injured the foliage. This preparation may be rendered less caustic by the addition of ordinary carbonate of soda.

"Another and more simple modification of the *eau celeste* is prepared by dissolving in 1 quart of liquid ammonia, 4 to 6 oz. of carbonate of copper, then dilute with water to 25 gallons. The ammonia and carbonate of copper solution may be kept in a bottle, and diluted when required for use at the rate of about 1 oz. of the solution to the gallon of water. Those who have used this preparation on the Grape Vine, say it is perfectly harmless to the foliage, and is as efficient against mildew as *eau celeste*.

"Simple solutions of sulphate of copper should not be employed during the growing season, as their use is almost certain to result in injury to the foliage. The Bordeaux Mixture may be used at any time without fear of injury. In using one or other of these preparations, the following course of treatment is suggested:—

"(1). In early spring, before the buds have commenced to expand, spray the trees thoroughly with a solution of sulphate of iron, using four pounds of the iron sulphate to four gallons of water.

"(2). As soon as the fruit has set, apply the Bordeaux Mixture or one of the modified preparations of *eau celeste*.

"(3). If the weather should be such as to favour the development of the 'scab' fungus, a third application should be made two or three weeks after the second, using the same materials.

"In addition to the effect that these applications may have on the development of the fungus, they will doubtless serve to keep off many insect pests.

"In storing the fruit for the winter, especial care should be taken to separate all the Apples showing any signs of the scab from those which are smooth and healthy, and they should all be kept in rooms or cellars free from moisture."

These are the sum total of the recommendations which have been made, but we have no positive information as to the practical results. "*Grevillea*."

A PLANT OF ILL-REPUTE.

Two very different plants, the Meadow Saffron and the Saffron, have been sometimes confounded. As a frequent visitor at Saffron Walden, which derives its name from the latter plant, I have long been acquainted with the harmless character of *Crocus sativus* saffron, which was cultivated at Saffron Walden, for domestic use, from the time of Edward III, till the last century, when Saffron for colouring purposes in cookery fell out of use, and which is still found wild in this neighbourhood. But Meadow Saffron (*Colchicum autumnale*), had never fallen under my observation till lately. It is a plant which farmers ought to know, and do know, in the districts where it prevails, not because it yields a potent remedy for gout, which those who lead an out-door life are not specially liable to, but because it kills their cattle. It is, in fact, an exceedingly dangerous plant, every part of it being poisonous at one period of the year or another. Owing to much intercourse with farmers, and some knowledge of the land and of cattle, I should probably have known this conspicuous plant if it had grown at all commonly in the East or South of England, or in the Midlands.

It is commonly stated that *Colchicum autumnale* grows in the pastures of the North-west of England, and I have lately met with it blossoming in the pastures of Herefordshire and other counties bordering on Wales. About 2 acres of one field were thickly covered with its beautiful lilac-coloured and vase-shaped blossoms; but, as a rule, the patches of this plant of ill-repute were of much less extent. It happened that I was visiting a gentleman who owns a very valuable herd of Hereford cattle, and at this time of year animals worth hundreds of pounds each may be seen grazing among the *Colchicum* blossoms without suffering injury. One almost pities the handsome white-faced cattle for the danger they seem to incur. But it does not appear that in point of fact, they run any risk; the blossoms are poisonous, but they are eschewed by the cattle, and no cases of poisoning have been reported at the period of flowering. Botanists will need no reminder that the plant in question bears its leaves and its flowers at different seasons of the year; and, unlike the Coltsfoot, which produces flowers early in the year, and leaves later on, the Meadow Saffron bears its leaves in spring, and its flowers in September. I noticed the blossoms in meadows from which the hay had been removed much later than usual this year, and the blossoms probably would have appeared in August,

if the hay had been carted at the usual season. It is said that children have been poisoned by eating only a few of the attractive-looking petals; they would not be likely to eat many, on account of their strong acrid taste. The leaves, too, are of ill-flavour; but, in the spring, when cattle are first turned into the pastures, they eat the scanty green food greedily, and are sometimes poisoned by swallowing the leaves of *Colchicum* with those of grass. Farmers have a wholesome dread of the plant, which, they say, can only be eradicated by spudding-up the bulbs. Possibly, some dressing might prove effective for its destruction. Meanwhile, its blossoms ornament the pastures of the West, just as the several varieties of *Crocus* do the turf of St. James's Park or elsewhere. The *Crocus* springs in pastures in several places, not as a native wildling, but as a plant escaped from culture; as when old gardens have been turfed over, and the bulbs of *Crocus* and *Narcissus* have continued their reproduction years afterwards. As a poet has said:—

"Long years ago, it might befall,

When all the garden flowers were trim,

The grave old gardener prided him

Of these the most of all." *H. E.*

[By constantly pulling up the leaves during summer, and spudding up the bulbs (although this is difficult, owing to their great depth in the hard soil), the plants become weakened, and gradually die out. But this kind of extirpation of *Colchicum autumnale* is heartbreaking work, and it would in the end cost less to trench or steam-plough the land, and collect the bulbs. When land foul with *Colchicum* is mown for hay, the first job after cutting should be to send youngsters into the field to collect all the leaves and stems of the plants; the dried leaves being productive of illness and death amongst the cattle fed with them. *Ep*]

FORESTRY.

LARCH CULTURE.—The advantage of planting Larch upon ground that cannot be utilised for tillage, is illustrated in a variety of ways, but perhaps in none more so than by an example which came under my notice a short time ago in Ireland. The plantation which I refer to was planted, under my direction, thirty years ago, and consists principally of Larch and Scots Fir, planted at a distance apart of about 3½ feet, or, in round numbers, at the rate of about 3500 plants per imperial acre, the plants being mixed in an even and uniform manner as the work proceeded. The soil consists of clay and gravelly loam, resting upon a gritty subsoil of clay that required draining. The ground had been under a state of tillage for many years, but had never been properly cultivated, so that the surface was principally clothed with noxious weeds, and in consequence of which the tenant was unable to pay his rent. Under such circumstances, the proprietor had no alternative but either to plant the ground, or allow it to lie unoccupied. All the plants grew remarkably well, and by the time they required thinning, it was evident that the Larch in all probability would be the best crop for profit and utility, so that the Scotch Firs were gradually cut out in the course of thinning, to allow space for the full and healthy development of the Larch. The trees now stand at a distance apart of about 8½ feet, or at the rate of about 600 trees per acre, and as each tree is worth on an average 5s., the present value per acre amounts to £150, which is by no means an extravagant estimate. Now, had the landlord received an annual payment of 20s. per acre, the amount received during thirty years of course would have amounted to £30, which shows a balance in favour of tree-planting to the amount of £100 during the above period of time. The cash realised for thinnings did more than cover the expense of the formation and working expenses, as well as the interest for the capital employed. In Ireland small thinnings are always in demand by farmers and others, and fetch from 1s. to 5s. per dozen, according to size and

quality. But although the present value of this plantation is highly encouraging, yet I believe the prospective value would be much more so, as the trees are in the best of health and making rapid progress, not the least appearance of ulceration or larch disease of any kind, such as we are accustomed to see in many parts of England and Scotland. Another point in favour of Larch culture is, that the tree being deciduous the ground is coated with its leaves every autumn, which fall as regularly and even on the surface as a shower of snow, and as these get fixed to the spot and are not apt to be blown away by the wind they soon rot and decay, and thus leave a rich deposit on the surface which promotes the growth of natural grasses close to the stems of the trees, and as these soon form a close green sward on the surface, it makes excellent pasture for sheep and cattle. This plantation affords a remarkable example of this, as the principal weeds and surface scrub has disappeared, and been supplanted by nutritious pasture plants and natural grasses, which are very valuable. But in recommending the planting of trees on waste land, we must not overlook the utility of shelter, as I consider good shelter for animals to stand next in importance to that of a proper supply of nutritious food.

Great Britain is a mining country, and the quantity of timber which we require for mining purposes is something enormous, the greater portion of which comes from Sweden; and as the quantity required is still increasing, surely that ought to act as a stimulus to owners of waste lands to have them planted and turned to better account. But the quantity of timber required for mining purposes in this country is but an item by itself, after all, for when we contemplate the quantity of wood required in the formation and maintenance of our railways, telegraphs, and other purposes, the stuff required soon swells to colossal dimensions. In a paper before me, which bears upon this subject, I gather the following statement:—“The exports from Sweden of matches are on the increase, and amounted, during the first half of the present year, to 6404 tons, against 5816 tons in the first half of 1890, 6253 tons in the same period of 1889, and 5951 tons in the same period of 1888.” Owing to our geographical position, we cannot grow timber of a similar size as what we get from America and other places, for particular purposes; but I have no hesitation in saying that we can grow timber of a suitable size and quality for mining and manufacturing purposes, including matches.

Keeping in view the increasing demand for timber of all shapes and sizes, from the mere sapling up to trees of large size and matured growth, which, as I have shown, can be grown upon ground unsuitable for tillage, we may well be amazed that men of capital and enterprise have not turned their waste lands to better account long ago. By planting marsh and mountain-ground, many millions of money might be kept at home annually in place of being drained out of the country; many thousands of able-bodied men could find employment at home in place of emigrating to foreign parts to procure a livelihood. Much has been said and written of late about the utility of establishing a school of forestry in this country, and I wish it every success; although at the same time, I would strongly advise all who wish to acquire a knowledge of tree culture to take their lessons at first-hand from God's book of Nature to man. The trees, the earth, the herbs, the rocks, and the insects, can all teach us much in every-day life if we would only condescend to study them.

WHAT TO PLANT.

Now that the planting season is at hand, foresters will require to exercise their judgment as to the selection of trees for different soils and situations, and in doing so, there is no better guide than past experience and observation. In the *Gardeners' Chronicle*, Oct. 17, p. 458, I see an interesting article on coniferous trees of recent introduction, and in which Mr. Malcolm Dunn, gardener, Dalketh, considers *Cupressus macrocarpa* one of

the best trees for the afforesting of Ireland. Mr. Dunn, it appears, gathered his experience of tree-planting in Ireland, at Lord Powerscourt's estate, co. Wicklow, and as a great part of this county is hilly, and in a marine situation, the tree in question thrives very well, and justifies Mr. Dunn's recommendation. But co. Wicklow is but a small portion of Ireland, and to recommend *C. macrocarpa* as one of the best trees for afforesting that country is by far too sweeping a nature. In inland situations in the north of Ireland the hardness of this tree cannot be depended upon. In the Lough Neagh district, co. Armagh, I had this tree planted in quantity as forest trees, and after they had attained a height of some 8 feet they were all killed by frost in 1861-2; others in inland parts of the country shared the same fate. *C. macrocarpa* can only be planted with safety in the south of Ireland; and in the north, a few miles inland from the seashore. Some time ago, when overhauling and renovating Lord Carysfort's ornamental plantations at Glenart Castle, in the Vale of Avoca, I found *C. macrocarpa* to be in excellent health, and very ornamental, but as a timber tree for utility and profit, it cannot be compared with some other species of conifer of recent introduction, inasmuch as the timber of young trees is of a soft texture, and wanting in resinous matter.

About eighteen years ago, I gave directions for thinning a series of young plantations in co. Tyrone. The trees at that time appeared to me to be about ten or twelve years old, and had never been thinned before. I again inspected these plantations in the month of September this present year, and found them in a thriving condition, and making rapid progress, and the following is the girths of the stems of a few species taken at 3 feet from the ground, and will furnish a pretty good index as to their growth and utility:—Common Spruce, 2 feet 2 inches; common Silver Fir, 3 feet 9 inches; Scotch Fir, 2 feet 9 inches; Larch, 2 feet 9 inches; Pinaster, 3 feet; *P. austriaca*, 2 feet 11 inches; *P. Cembra*, 1 foot 10 inches; *Cupressus Lawsoniana*, 3 feet 6 inches; *P. excelsa*, 3 feet 4 inches; *Abies Douglasii*, 3 feet 6 inches; *Wellingtonia gigantea*, 7 feet 6 inches; *Cedrus atlantica*, 2 feet 6 inches. *Cupressus macrocarpa* and *Pinus insignis* had disappeared altogether, probably they had died out, or been killed by frost. The soil here is of a free, open texture, about 30 miles towards from the sea, and about 200 feet above the level of the same, aspect south. Many years ago, I directed the attention of planters to the merits of *Thuja gigantea* (Lobbi) as a probable substitute for Larch, and I am glad to see that other planters can recommend the tree after a fair trial. This species is capable of growing on stiff adhesive soil on exposed situations, as well as on reclaimed peat bog in marsh and mountain.

In the *Gardeners' Chronicle*, October 10 (p. 425), there is an article on the naturalisation of exotic forest trees in Prussia, in which we are told that the Douglas Fir does not thrive in low peaty swamps. The reason of this is, that the peat or moss-ground had not been properly prepared by draining previous to planting, as this Fir is very impatient of wet at the roots, but when the moss is properly drained, and allowed time to drip and cleanse itself from any impurity before planting the trees, they soon take to the ground and make rapid progress. At Churchill, Verner's Bridge, Ireland, I planted some of these Firs many years ago, on flat peat bog about 30 feet deep; the bog was well-drained and in an advanced state of decomposition previous to planting. The trees were planted in spring, which is the best season of the year for planting this class of ground, as the antiseptic properties of peat are apt to damage the roots of trees planted during autumn and winter, but after the roots take to the ground no danger need be apprehended. At the time of planting the trees, a small quantity of earth or pulverised clay was mixed with the staple at the spots where the trees were planted. These trees established themselves in the ground at once, made rapid progress, and are now magnificent specimens. The ground here is sheltered by other trees

in the vicinity of which, I have no doubt, was favourable to the growth of the trees, as the Douglas Fir is very impatient of wind. The only drawback which the trees exhibit here is that they cannot raise their heads above the tops of their hardy neighbours; as soon as they feel the full sweep of the wind on their tops they lose their leader and form a bushy top. On Heather ground and wind-swept districts of Ireland, no better tree can be planted for profit and utility than the Larch, and as two-year seedling plants can be planted by the notch system of planting at the rate of about 40s. per acre, that of itself is a great recommendation. Another point in favour of Larch planting in Ireland is, that I have never found a single tree in that country affected by ulceration or Larch disease proper. The Larch is naturally a tree of the misty mountain, and when planted on such places it can live and attain a profitable size where many other trees would perish. *J. B. Webster.*

ROSERY.

AUTUMN IN THE ROSE GARDEN.

WHEN Tom Moore wrote about—

"The last Rose of summer left blooming alone,
When its loveliest companions are faded and gone,"

it was not the days of hybrid perpetuals and Teas, but of the old Provence and Gallica Roses which filled our gardens with beauty and perfume in June, which was then emphatically the month of Roses, and we can just see the poor survivor of the heats of early July shaking on its long shoot until its petals dropped; but now all that is altered, our Roses do not come in so early, unless we grow some specially for that purpose. July, not June, is now decidedly the month of Roses, but in September we get a new flush of beauty, and in a cool season like the past, grand blooms were to be had of many H.P.'s, while Teas everywhere caught the eye, and gladdened us with their soft and delicate beauty. There is doubtless a capriciousness about the H.P.; some bloom but sparingly, but there comes a season (why we cannot tell) when the same plant comes out strongly as an autumn bloomer, while others seem, for one reason or another, to refuse in certain localities to give a second crop of blooms. Thus, there is one Rose which is very despairingly spoken of as an autumn bloomer—

Madame Gabriel Luizet, yet I have always found it giving me good blooms in September, and this year I had not a plant which did not flower, while with two or three there was literally a profusion of bloom. I do not think that in any pink Roses we have anything so lovely as this Rose when at the height of its beauty; and it most certainly enhances its value, when we find it blooming so well in the autumn. There can be no doubt, however, that it is capricious in this respect, as so many complain of it as being only a summer Rose—mine are cutbacks on the Manetti of some years' standing.

Gloire de Margottin.—This is another capital autumn bloomer, a not very full Rose, and I believe with a good deal of the *Gloire des Rosomanes* blood in it, and therefore very brilliant in colour. Its growth is somewhat straggling, suggesting a pillar Rose, it is therefore vigorous, and its bright flowers are distinguishable at a distance.

Gloire Lyonnaise.—This, which was described as a yellow hybrid perpetual, is in reality a hybrid Tea, having the very faintest suspicion of yellow at the base of the petals. It is an excellent garden flower, and blooms well in the autumn, when the yellow tint is a little more pronounced. The wood is stout, and the substance of the flowers good.

Mrs. John Laing.—The very best Rose I think that the late Mr. Henry Bennett ever sent out, and well deserved the Gold Medal of the National Rose Society, which it obtained. It is of a soft delicate rose colour, beautiful in shape, and of good substance; to which may be added, that it is one of the very best autumn-blooming Roses that we have.

Gustave Piganeau, said by some to be a sport from Paul Neyron, by others from Antoine Ducher; if from the former, it retains one of those qualities for which it is so great a favourite in and about Paris, its free autumn-blooming character, for the most abundant Rose at that season in the bouquetists' shops, is this huge coarse flower. In the autumn-time it loses a good deal of its size and coarseness. *Gustave Piganeau* is unquestionably a good autumn bloomer, of a fresh, lively colour—light carmine.

Margaret Haywood.—A very pretty light pink Rose, sweet-scented, of good form, and, so far as my experience goes, likely to prove a good autumnal flower. There is another flower by the same raisers (Paul & Son), which I have seen, but not grown, which I think promises to be a good autumn flower—Bruce Findlay, very bright, somewhat in the style of *Gloire de Margottin*.

The greater proportion of flowers in the garden is, however, furnished at this season by the Teas, which do not indeed equal the hybrid perpetuals in brightness of colouring, but are always favourites from their extreme delicacy, refinement and delicious perfume (although I have found people who dislike it). I do not know to whom we are indebted for the absurd term "hybrid perpetual." The French, from whom we first received the Roses, gave them a much better name—"second-flowering" (*remontant*)—thus clearly distinguishing them from the summer Roses, whose young shoots never support a flowering-bud. The Teas continue to bloom up to the time when frost holds them in its iron grip, and nearly all of them are very generous in giving us blooms in the autumn. Perhaps the two most remarkable in this respect are *Marie Van Houtte* and *Madame Lambard*, the former with its beautiful creamy-white flowers, edged in autumn with pink, and the latter of all colours. I have at this season of the year, gathered blooms, off the same plant, of a bright red, and others of a creamy-yellow tint. It has one fault, when gathered the colour is apt to fly, and the centre to become confused, but as a garden Rose it has few rivals. Of the new varieties I have found—

Souvenir de S. A. Prince, very free, as is the Rose from which it is a sport, *Souvenir de mon Ami*. During the last season it has increased the estimation in which it has been held, and will, no doubt, in the future be a greater favourite still.

Somewhat allied to the Teas are the little dwarf Polyantha Roses, and these are very fine and constant bloomers. The little *Perle d'Or* and *Mignonette* are very charming just now.

Single Roses, of course, are not to be expected at this season of this year, but how very delightful are—

Rosa rugosa and *lingosa alba*, for not only do they give an occasional bloom, but they are loaded with their handsome and large hips, brilliant in colour, and set in the midst of very handsome foliage. These are beloved of birds, and hence, and for their density, they are coming much into favour for covers; but they are very beautiful in the garden, requiring, however, to be kept in check, or they will soon overrun other things. Another single, or sometimes semi-double, Rose is—

Rosa Passardii.—This with me in October, flowered in great profusion. I do not know whether this is unusual or not. The flower is pure white, small, with yellow stamens, and is frequently semi-double, although more beautiful in its single state.

It would not be fair to omit the *Noisette* or *Tra-Noisette* Roses, which are now giving us many pretty blooms of the more rampant-growing ones of the *Gloire de Dijon* race. The most satisfactory in the autumn blooming are *Belle Lyonnaise* and *Bouquet d'Or*, the former especially, is giving many very beautiful blooms, and does not come so quartered in autumn as in summer. Now those charming Roses, *William Allen Richardson* and *L'Idéal* are giving variety and depth of colouring to the bouquet, which, even in so small a garden as mine may now be gathered; and although I do not exhibit, yet the greater portion of my Roses are exhibition Roses. I do not confine myself to them; the single Roses charm me quite as much, and I know nothing more

exquisitely beautiful, in its way, than the common wild Briar of our hedges and woods, and I think lovers of Roses do themselves wrong when they do not find a place for *Polyantha simplex*, *Macrantha lucida*, and such beauties; but, at the same time, I hope that their admirers will not look with pitying contempt on those who can also admire a *Marie Baumann*, or *Charles Lefebvre*. *Wild Rose.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

BANKSIAN ROSES.—These popular climbing Roses should be given a warm situation, and allowed plenty of room to develop, and show off to the best advantage their small globular white and yellow flowers and long shining leaves. The varieties are:—*R. Fortunei*, white, large-sized flowers; *Jaune Serin*, very rich yellow, with fine foliage; *Alba*, or white (the old variety), small white flowers; *Lutea*, or yellow (the old variety), fine yellow flowers, small and full.

MINIATURE, OR FAIRY ROSES.—The productions of these diminutive Roses as staged by Messrs. George Cooling & Sons at the Bath Rose shows, have served to demonstrate their suitability and great utility for decorative purposes. In a cut state the flowers are useful for vases and nice in bouquets, and the plants are admirably adapted for pot-culture, or as edgings for Rose beds, &c. The best varieties are:—*Anne-Marie de Montravel*, flowers very small, of the purest white, a perfect "fairy Rose," and deliciously scented; *Lawrenciana rubra*, the old double red tary, free flowering, and very pretty; *Mignonette*, soft rose changing into white, very beautiful; *Paquerette*, pure white, very continuous and pretty; *Perle d'Or*, yellow with orange centre, flowering in large clusters, novel and distinct, and very pretty in the bud state; *The Pet*, double white, protuse bloomer, and one of the prettiest little Roses in cultivation.

CLIMBING EVERGREEN ROSE.—To be accurate, the so-called evergreen Roses, which have originated from *Rosa sempervirens*, are only sub-evergreen, retaining their leaves till the approach of spring. They are well adapted for covering pillars, arches, and banks, being vigorous growers and free-bloomers; the large clusters of small variously-coloured flowers being very telling in effect. The shoots should be well thinned in pruning, and left nearly their full length, merely cutting off the weak points of the individual reserved growths. The varieties here recommended are:—*Adelaide d'Orleans*, white; *Banksiaeflora*, white, centre pale yellow, small flowers; *Dona Maria*, pure white, small; *Félicité-Perpétue*, creamy white, flowers small, full, and beautiful; *Leopoldine d'Orleans*, white, shaded with rose; *Princess Mary*, reddish pink; *Princess Louise*, blush; *Spectabilis*, rosy lilac, large, and double.

PLANTING TREES AND SHRUBS.—Where the making of beds and borders for ornamental trees and shrubs is contemplated, the work should be pushed forward quickly, with a view to getting the planting done before frost sets in. The borders, if new, should be slightly or boldly irregular in outline, according to the size of them, and beds should be of a simple shape, irregularly but gracefully curved. The land should be trenched or dug two spits deep, and if it be of good quality, the bottom may be brought to the top; where the soil is shallow and poor, leaf-mould, road-scrappings, and such like should be added after it is dug, mixing these materials with the staple whilst planting. In the case of the natural soil being still and heavy, wood and coal-ashes may be applied in addition to the other substances, which render it more congenial to the requirements of the rose. I may here remark that *Rhododendrons* and *Azaleas* will do fairly well in the latter description of soil, and still better if a few shovelfuls of peaty soil be placed about their roots in planting them. If leaf-soil be plentiful, and peat less so, it may be used instead of the latter. *H. W. Ward, Longford Castle, Salisbury.*

FRUITS UNDER GLASS.

THE ORCHARD HOUSE.—The trees being now at rest, should be stood in the open, the pots plunged in Cocoa-nut fibre or coal-ashes, and the house cleaned, repaired, and painted if necessary, and everything got in readiness for a start at the new year. If the trees have been repotted or top-dressed, and are now

in the open air, care must be taken to ensure their not suffering from excessive rainfall, but at the same time do not so protect them that they will become dry at the roots. The trees should stand on a bottom impervious to worms, which would soon spoil the drainage. Fruit-houses at this season are often filled with *Chrysanthemum* plants, and the borders are apt to get more water than is good for the trees, besides the atmosphere being kept close to hasten the flowering of the plants, or to keep out the frost, and in some instances these conditions tend to bud-dropping. Any trees late in ripening the wood should now be repotted or top-dressed, and the shoots painted with Gishurst Soap after being washed with warm water; if scale or mealy-bug be present, a stronger insecticide should be used.

CUCUMBERS.—With the absence of bright sunshine, it will have been necessary to use fire-heat freely, but I would advise affording the plants a few degrees lower temperature on sunless days, in preference to hard firing, and to keep a supply of sweet fermenting material in the house to assist in keeping up the warmth. With a lower day temperature, the night warmth must be made to correspond, and 65° will be sufficient, the glass being covered at night with mats or dressed canvas, which will make from 6° to 9° difference in the temperature of the house, and prevents sudden changes in variable weather. The day temperature will be much influenced by the weather; on cold days without sun, it may reach 70°, with a rise of 10° or 15° when the sun shines. Avoid heating the hot-water pipes much in the morning, and injuring the tender foliage. Watering will also need care, so that canker may be avoided; and what watering is required should be done early in the day, and the stems kept dry at the surface; heavy syringing should now cease. Continue to entice new roots to the surface by small top-dressings of rich compost, and see that the fresh soil is of the same temperature as the bed, and make it firm, so that the new roots may get a hold, and thus favour a sturdy growth. The plants will show an abundance of fruit, but these must be removed if fruits are wanted in quantity after the new year. Continue to train the bine, stopping it as required. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

CELERY.—Celery for late supply should be earthed-up before it gets injured by frost. Soil itself affords the best protection against frost and moisture, but if it should be of a very heavy nature, dry Fern or light stable litter should be placed on each side of the rows during hard weather, instead of almost covering the plants with soil. But where the soil is light, that alone forms the best kind of protection, and the plants should be earthed-up when dry, only the tips of their leaves being visible. In very wet or very heavy soils, the better plan is to plant Celery on the level, or but a slight depth below ground, the necessary soil for moulding the plants being obtained in the usual manner.

ASPARAGUS.—The beds should now be cleared of dead stems and weeds, and evenly top-dressed with rotted manure, or in places with access to the seashore, with sea-weed. Then mark out the beds anew, and if the look of manure be objected to, a little of the soil from out of the alleys may be strewn over it, and the alleys lightly forked over. This mode of treatment applies only to beds on dry soils; on heavy ones I advise covering the beds with dry leaves, over which a thatch of straw or bracken should be placed, and no manure made use of, alleys being dug to the depth of 1 foot or 1½ foot below the top of the beds in order to secure good drainage, and the top-dressing applied in the spring in the form of artificial manure in preference to stable or farmyard dung. Plants which will be needed for forcing should be covered with litter to keep out frost. Seedlings or young plants in beds on light land should be cut down, and the ground dressed with half-rotted manure; this will protect the roots and crowns which are near to the surface.

CARDOONS.—Those plants which have been blanchet by means of wrappings of brown paper or hay-bands, before hard frost, should be lifted with soil and roots, and placed in a cool, frost-proof shed, or laid in upright, packing the roots round with cocoa-nut fibre or leaf-mould, in which way they can be kept fit for use for a long time.

BROAD BEANS.—These may on warm, dry soils, be planted from the present time till the end of the month, but on heavy ones it is a waste of seed and labour to show at this season. A warm border or other piece of ground should be chosen for this sow-

ing, and it should have been well tilled and manured for some other earlier crop, and in that case no manure will be required, the plants standing the winter better when the soil is not very rich. Make the soil at the bottom of the drills moderately firm by treading it before sowing, and let them be drawn 2½ feet apart, and about 2½ inches deep. The varieties to sow at this season are Mazagan, Minster Longpod, and Dwarf Cluster.

PEAS.—On a light, well-drained sunny border, sow about November 15, any of the First Earlies—William I., Ringleader, or Veitch's Extra Early. The ground being well tilled, and only lightly manured. The drills may be placed as much as 7 or 8 feet apart to allow of early Potatos or Cauliflowers being planted between them; or they may be 3 feet apart. Make the drills as for Beans. Sow thickly, making them safe from the ravages of mice, slugs, and sparrows. After the rows are well filled in, cover them with fine soil and a layer of coal-ashes of about 1 inch thick. In the colder parts of the country, out of doors, early sowings of Peas are not to be advised. *C. J. Waite, Glenhurst, Esher.*

PLANTS AND THEIR CULTURE.

HARD-WOODED PLANTS OF THE GREENHOUSE.—At this season attention should be paid to the training of hard-wooded plants, care being taken to place very few sticks in the pots of plants with hair-like roots, such as Cape Heaths, and many of the New Holland plants, great injury resulting from the practice of putting a large number of them into the balls. In training specimen plants, only as many ties should be afforded as will keep the plants in form. On the other hand, plants which are grown mostly for supplying flowers for cutting will not require many sticks, and in some instances no training is necessary, as, by cutting the flowers, the plants are kept sufficiently in good shape. Look frequently over all the hard-wooded Heaths, and on the first signs of mildew, dust affected parts with flowers-of-sulphur. *Azalea indica* should be frequently examined, and if thrips are present, fumigation, or washing with an insecticide, should be resorted to. Admit air on all favourable occasions, but at the same time avoid admitting draughts of cold air in direct contact with the plants.

STATICES.—Plants of these are liable to be infested with thrips and red-spider, so the plants may be sponged at intervals, which is preferable to overhead syringing at this season. Let the night temperature during the winter fluctuate between 45° and 50°, affording a rise of 10° or 15° by day, according to the state of the outside temperature and the amount of ventilation that is afforded, as, if the temperature falls below the former point, the plants are liable to become stunted in growth. Less water will now be required and during the winter, but care should be taken not to allow the soil to become so dry as to cause injury.

CYCLAMENS.—These plants are now coming into flower, and they need to be kept well up to the light in a low pit or house, where fire-heat can be obtained when required, that is, to keep the temperature at night at about 45°, and by day 55° to 60°. Any plants still in cold frames should be taken to the greenhouse or pit without further delay.

MIGNONETTE.—Plants which have had their final shift and are well rooted should be assisted with weak dung-water, or some well-ried fertilizer, occasionally; and as the plants show for flower, steady them by putting a few neat sticks into each pot, and a girde of bast passed round these. The later batch of Mignonette plants should be kept well up to the glass, to prevent drawing.

EUCCHARIS AMAZONICA.—Plants which were broken up and divided, or repotted without disturbance of the roots in the spring or early summer, and have been grown in a brisk temperature, will now be showing flower freely, and at no other season are they more appreciated than now and during the winter. Every care should be taken of them, and the flowers saved from injury; keep the foliage clean by sponging it occasionally with clean water, the blooms showing to greater advantage when the foliage is glossy and clean. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

THE EAST INDIA-HOUSE.—With the month of November, *Cypripedium Spicerianum*, that gem amongst the gems, comes into flower. Time was when the price asked for this plant was excessive,

but now it may be bought for almost as many pence as pounds were formerly asked for it, and it seems in some degree to be losing the position which its beauty once commanded. Like many *Cypripeds*, it is of free growth, so long as plenty of heat and water are given it, it maturing little what kind of compost the plant was placed in. The best materials in which to grow it consist of fibrous peat chopped fine, turfy loam of equal quantities, and some coarse silver-sand. When watering this plant, which is needed almost every day, the water should be poured over the foliage of the plant; no fear need be felt of the centre rotting, or young growth either, if ventilation and artificial warmth are given in a proper manner. The above treatment will be found to suit the greater proportion of *Cypripediums*, except those of the *C. barbatum* section, which do not like loam or peat, but sphagnum moss alone, the roots of this section being large and fleshy. Any *Cypripediums* in need of repotting, may be done at any season; indeed, I make it a practice to repot almost everything as soon as may be after it comes under my charge, as by doing this, I know what state the plant is in, and how to treat it. Now that so little is to be done in repotting, the opportunity should be taken to clean all the plants with the sponge and brush, using soft-soapy water for the work, not neglecting to cleanse also the walls, stages, pots, and floors. Again, in the re-arrangement of the plants, they should be staged in such a manner as best suits their several requirements. Plants set up in banks upon the stages, the large plants behind in rows followed by smaller ones, and of necessity removed from the light, are not likely to do well. Some plants have a preference for a shady place, and these should be placed under larger plants that may require more light than those, and *vice versa*; some need more air than others, and some again delight in moisture. If the air be foggy and damp outside, a moderate amount only should be admitted, and a little extra heat kept up in the hot water-pipes. The temperature of the East India-house should now range about 63°; 60° for *Cattleyas*; 55° for the intermediate-house; and 45° to 50° for the *Odontoglossums*. *A. G. Cull, Parkfield, Hollow.*

THE HARDY FRUIT GARDEN.

The busy time in the fruit garden has arrived, and those who make the best use of the present month for pushing forward with all kinds of work therein will reap their reward.

RASPBERRIES.—These plants often occupy the same plot of ground for so long a time, and instead of heavy crops of fruit, the produce is lessened year by year. New plantations may now be made, and in such a way that the fruit can be easily protected from birds. The soil should be well manured with half-decayed dung, deeply dug; but as the Raspberry is a surface-rooter, the larger proportion of the manure should not be buried deeply. Break the subsoil, if at all impervious to water, but heavy soils may be rendered more porous and easy in working by mixing in plenty of road-sweepings, leaves, or half-decayed dung during the digging.

If suckers were lifted early in summer, planted, and attended to as regards watering in dry weather, they will have made good canes, which may be transplanted at this season in clumps of three at 6 inches apart, and at a distance of 4 or 5 feet from clump to clump. In the open quarters, I prefer clumps to rows closely planted. In spring, after all danger from frost is past, cut these canes back to half their length, or more if they are weak. These clumps will need no stakes to support them, the weight of the fruit bending them outwards and clear of the new canes. For plants in lines at 1 foot apart, 5 feet between the lines, is not too much. These canes are usually fastened to a wire espalier. No fruit should be allowed the first year after planting. New plantations made with nursery canes, or canes dug up at this season, should be cut down to the ground in early spring. Red Antwerp, Baumforth Seedling, and Superlative, with Belle de Fontenay as an autumn fruiter, are good varieties to grow.

STRAWBERRY BEDS.—These should be put in order for the season, mulching with manure, which should be close round each plant, especially the tender varieties, as Sir C. Napier. Young plants that were rooted early in pots or on turves, and planted out in August on well-prepared beds, will by this date have made grand fruiting crowns, and should, when the soil is moderately dry, be thoroughly trodden tight in the soil. *H. Markham, Merceorth Castle, Maudstone.*

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &C., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY,	Nov. 19—	Lincoln.
		SHOWS.
TUESDAY,	Nov. 17—	Twickenham (two days). Liverpool.
WEDNESDAY,	Nov. 18—	{ Ancient York Florists' (three days). Hull and East-Riding (two days). Spalding (two days). Cardiff (two days).
THURSDAY,	Nov. 19—	{ Scottish Horticultural Association (three days). Norwich (two days). York Chrysanthemum.
FRIDAY,	Nov. 20—	{ Stockport (two days). Chorley (two days).

SALES.

MONDAY	Nov. 16—	{ Large Importations of Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 17—	{ 9000 Liliun auratum, and other Hardy Bulbs and Plants, at Pro- theroe & Morris' Rooms.
WEDNESDAY,	Nov. 18—	{ Dutch Bulbs, Roses, Border Plants, at Stevens' Rooms. Azaleas, Ferns, Bulbs, &c., at Pro- theroe & Morris' Rooms. Nursery Stock, at the Kingston Hill Nursery, by Protheroe & Morris.
THURSDAY,	Nov. 19—	{ Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 20—	{ Important Sale of Orchids, at Pro- theroe & Morris' Rooms
SATURDAY,	Nov. 21—	{ Evergreens, as Laurels, Conifers, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°·9.

A PAMPHLET recently published by Mr. W. H. (BULLOCK) HALL, at the Cambridge University Press, gives some account of an experiment made by that gentleman, which does credit to his sagacity as well as to his benevolence. Believing that accessories like fruit-farming and market-gardening are indispensable to the success of small holdings, especially in Ireland, where the farms are so greatly sub-divided, he advocated in a letter to the then Lord-Lieutenant, the promotion of the cultivation of vegetables and bush fruit, especially in the south-west of that country. Soft fruits, choice vegetables, early Potatos, and flowers for market might, owing to the climatal conditions, readily be grown in that district. But correspondence with a Lord-Lieutenant is slow in producing results, so that Mr. HALL eventually adopted the plan of distributing among the school-masters, station-masters, and post-masters of the south-coast of the county of Cork, a number of fruit trees, with directions for planting and pruning them. One hundred and seventeen applicants, including seventy-three National School teachers, were thus provided with fruit trees at Mr. HALL's expense. With a view of inspecting the trees presented by him, Mr. HALL recently visited Ireland for the

sixth time. On this occasion he was accompanied by Mr. RIVERS, who availed himself of the opportunity to give some sound practical advice to the assembled tenants.

The neighbourhood of Youghal was generally admitted, both by its soil and climate, to be eminently adapted to the culture of fruit and vegetables. It is relatively sheltered, there is abundance of seaweed—furnishing potash, whilst Cork and Queenstown are within about an hour's journey by rail, and furnish a convenient market for the disposal of the produce both to the towns-people and to the numerous steamships which put into Queenstown on their way to and from the United States. We cannot follow the track of the travellers on their useful mission. It is evident, however, that Mr. HALL does not allow his enthusiasm to outrun his discretion. The evidence he lays before the reader amply confirms the propositions he lays down. In the Fingal district, south of Drogheda, an acre of ground is cultivated by the post-master, the fruit being represented by two-fifths of Raspberries, the same proportion of Gooseberries, and one-fifth currants and miscellaneous subjects, together with Potatos and Cabbages. The wife of the proprietor here exclaimed, "The fruit is a great paying business." The husband, however, adding that the Irish small farmers "are not refined to this business yet;" and then the significant note follows that the inhabitants of the prosperous Fingal district, where fruit cultivation is carried on to a considerable extent, are of Danish descent.

Near Skibbereen, Mr. FORTUNE, a post-master, sold Cabbage and Broccoli, the produce of one-eighth of an acre, for £4, the inhabitants holding up their hands in astonishment at the size of his Broccoli. Glandore, it is added, should become a centre for the production of early flowers, vegetables, and fruit, some of which might, it is said, be three weeks earlier in the market than the produce of the gardens near Dublin or Belfast. On his way home, Mr. HALL visited the Dublin fruit market, there to find English Plums and French Pears being sold by auction, but of Irish-grown fruit absolutely none. Mr. COLE, a fruit salesman, believes that the Irish peasant, now "entering for the first time into possession of his inheritance—the soil of Ireland, will, like the French after their Revolution, show the world what he can make of it." Mr. COLE advocates a system of small Government loans, to be guaranteed by the County Councils, to assist small farmers to start in fruit-growing. We cannot say anything about the political aspects of the case, but all parties must rejoice at the favourable prospects which appear to be opening out for the Irish peasantry and small farmers.

"I know," says Mr. HALL, in conclusion, "no nation more susceptible of refining influences than the Irish, and none where the women and children are more inherently gentle. They seem eminently suited to deal with fruits and flowers needing delicate handling. It is because I have been so painfully struck with the absence of such humanising settings as orchards and gardens round Irish homesteads, that I am contributing in a small way to supply the defect." By making the fact known, we believe Mr. HALL has taken the most effective means of inducing others to follow his example.

THE QUEEN has graciously consented to become patron of the International Fruit Show now being promoted by an influential body of horticulturists, of whom Sir JAMES WHITEHEAD is the chair-

man. The Exhibition will be held in London next year.

THE LINNEAN SOCIETY.—An evening meeting of this society will be held on November 19, at 8 P.M., when the following papers will be read:—1. "Notes on the original Portraits of Linnæus, made during a recent visit to Sweden," by Mr. W. CARRUTHERS, F.R.S. 2. "On a new Fossil Plant from the Lower Coal Measures," by Mr. T. HICK.

"BOTANICAL MAGAZINE."—The plants figured in the November number are the following:—

Dryophloeus appendiculata, t. 7202.—A remarkable Palm, native of New Guinea, with a slender ringed stem, and a terminal crown of pinnate leaves, the segments of which are wedge-shaped at the base, dividing at the apex into shallow triangular lobes; margins finely dentate; panicles issuing from the stem below the leaves. The flowers are greenish-white. The analyses show that the floral axis is raised above the sepals, and bears from its sides the petals and the numerous stamens as well as the ovary. Kew.

Pinguicula lutea, t. 7203.—A species with nearly regular yellow spurred flowers. Native of the Southern States of North America. Kew.

Angræcum fastuosum, t. 7204.—The Madagascar species described in the *Gardeners' Chronicle*, 1881, and again in 1885, part i., p. 533, fig. 96. Kew.

Cercus procumbens, t. 7205.—A Mexican species with spreading 4 to 5-angled stems, with tufts of spines, the central spine being much the longest. The flowers are 4 inches across, rose-coloured, with a greenish centre. Kew.

Disa tripetaloides, t. 7206.—The species described in the *Gardeners' Chronicle*, 1889, vol. i., p. 360; and figured in 1890, vol. i., p. 766, f. 127. Introduced from the Cape by Mr. J. O'BRIEN. The plant is very hardy, having been frozen hard in a cold frame without injury.

HORTICULTURAL INSTRUCTION.—It is with great pleasure that we are enabled to report that Mr. LEWIS CASTLE, one of the members of the staff of the *Journal of Horticulture*, and the Hon. Secretary of the British Fruit Growers' Association, has been appointed chief instructor in horticulture to the County Council of Hampshire. For us, who for so many years past, have advocated some such scheme as that now adopted, it is a great matter for satisfaction that such men as Mr. FISH, Messrs. WRIGHT and CASTLE are among those selected to carry out the provisions of the Technical Education Act. In so doing, almost everything depends upon the men employed in the work, but if, following in the steps of our Belgian and French friends, the authorities appoint men like those we have named, we have no doubt but that in a short time after a period of experiment, and perhaps some failures, a large measure of success will be arrived at. The important step taken by the County Council of Kent is alluded to in another column.

A NEW POISON IN CONIUM MACULATUM.—Chemists are always on the look-out for new substances by the discovery of which they may gain fame amongst their *confères*. If when found, they can manage to saddle it with a name extending over many syllables, and occupying a considerable period of time in its pronunciation, so much the better; is it not more glorious! Within the past four years a number of remarkable poisons belonging to the class of alkaloids have been discovered by enterprising chemists who have deserted the synthetic methods of the laboratory for the examination of plants. In doing this they are performing good services, as all know, and we have no doubt but that in a short time after a period of experiment, and perhaps some failures, a large measure of success will be arrived at. The important step taken by the County Council of Kent is alluded to in another column.

by its discoverer, Herr A. LADENBERG, who, it must be admitted, has shown great moderation in his choice of a name, considering the chances that were open to him of selecting a long one.

CHERRIES IN SEPTEMBER.—Mr. J. C. SCHMIDT, of Erfurt, writes as follows:—"I take the liberty of calling attention to a very late-ripening Cherry, called 'Hochgenuss von Erfurt' [Great satisfaction from Erfurt]. This Cherry is a very remarkable one, as the fruits begin to ripen when all other Cherries are over, namely, in the month of

ripe, half-ripe, and unripe fruits at the same time, because the fruits do not all ripen at the same time. The fruit itself is of a dark-red colour, of good size, and has a fine sourish-vinous taste. The history of this new sort of late-ripening Cherry tree is this: It is now some years ago that Mr. HEINRICH SCHMIDT, the former proprietor of the establishment, J. C. SCHMIDT, at Erfurt, found in a neglected nursery garden a wild Cherry tree, which, cultivated by him, became a nice, well-grown tree of very good appearance, and having the remarkable peculiarity of bearing in great number ripe fruits in

vigorous Groundsel in flower growing on a piece of old sponge that had been lain aside, and which furnished the requisite moisture, and a little more. It is astonishing how small a proportion of solid matter is extracted from the soil by plants in proportion to their bulk. Air and Water, Light and Heat, are each and all more potent factors in the growth of plants than is soil.

CUNONIA CAPENSIS.—Mr. BURBIDGE recently favoured us with a specimen of this effective greenhouse shrub, which, though an old inhabitant of

FIG. 80.—PROFESSOR M. TOSTER'S GARDEN AT SPELFORDS, CAMBRIDGE. (SEE P. 579.)

September. It is an agreeable and surprising sight for every lover of Cherries to see a tree in September laden with ripe and delicious fruits. The first ripe fruits are seen in the early days of September, while there are many fruits remain until the 15th or 20th of October. It is a well-known fact that fruits offered and brought to market at a time when nobody expects to find them there realise high prices, and, I think, in every case better than fruits which are offered when the market is full of them. It will, therefore, be profitable to the nurseryman and farmer to grow the 'Hochgenuss von Erfurt.' During the whole time of the ripening of the fruits, we find on the tree

September and October. The firm, J. C. SCHMIDT, has now a good stock of 'Hochgenuss von Erfurt' ready for distribution." Mr. SCHMIDT's letter was accompanied by a woodcut bearing out his statements, and taken from a photograph executed on September 12.

CULTURE ON SPONGE.—We have all heard, and many have practised, the cultivation of Mustard and Cress upon moistened flannel, and we know from experiment that the growth can be prolonged beyond the germination stage for a much longer period than could be anticipated. We were reminded of this the other day on the receipt from Mr. BURBIDGE of a

botanic gardens, is rarely seen out of them. This is to be regretted, for it is decidedly a handsome plant, with bold pinnate foliage, and long dense spikes of white flowers. The stipules are remarkable, being broad and leafy, and forming a flat case, at the bottom of which the young leaves are snugly enconced out of harm's way. Another peculiarity we observed in Mr. BURBIDGE'S specimen, is the presence of a resinous or milky juice, which exudes freely from the inner side of the base of the stipules, which appears to be provided also with numerous tubercles, perhaps of a glandular nature. We have not been able to examine the microscopical appearances, but we com-

mend them to some of the biological students of Trinity College as a promising subject for examination. *Cunonia* is not far off from *Escallonia*, which yields a coloured resinous juice.

MAIZE CULTURE.—The past summer was not such that one would have deemed propitious to the growth of Maize. Mr. LEACH, the gardener to the Duke of NORTHUMBERLAND, at Albury, near Guildford, is one of those who, recognising the significance of the old saying, that "one does not know till one tries," forthwith proceeds to try. The result as shown us recently was decidedly satisfactory, so much so, that in Mr. LEACH'S opinion Maize would form a profitable crop, the grain being used for cattle or poultry feeding.

ORCHIDS IN BRUSSELS.—Our correspondent notes that in the collection of Mr. PETERS there are now several fine forms of *Cattleya labiata* var. *autumnalis* in flower, part of an importation of some thousands of plants, while a second lot is expected shortly. Poor *C. labiata*! there will not be very much of it left before long. In the same establishment is a specimen of *Vanda cœrulea* with ten spikes, and very large flowers; a *Cymbidium giganteum* with five spikes, a fine *Cypripedium Sallieri* Hyeaenum of a translucent golden yellow, a specimen of *Cypripedium superbium* var. *Demidoff*, &c.

CHRYSANTHEMUMS IN BELGIUM.—Never have so many of these flowers been seen as this autumn. The little towns and villages vie with the large cities in their culture of the Chrysanthemum.

HOLLAND.—A society for the promotion of the study of the diseases of plants has been established at Amsterdam. M. J. H. KRELAG, of Haarlem, is the President; Dr. RITZEMA BOS, of Wagenengen, and Dr. H. W. HEINSIUS, of Amersfoort, act as Secretaries; and to one or other of them all communications should be addressed. Among the committee we also note the names of Professor HUGO DE VRIES and Dr. J. H. WAKKER, so that the Society starts under promising auspices.

L'ORCHIDÉENNE SOCIETY OF BRUSSELS.—A special feature of the exhibition of this Society on November 8 was the number of forms of *Cattleya Warocqueana*, the most striking collection being that of Mr. WAROCQUÉ, who showed twenty-six plants, almost all different in colouring, and comprising the fine varieties which attracted so much attention in Brussels and London last year. A variety *Ame-thystina* had flowers nearly 9 inches wide and 6 inches long; width of anterior lobe of lip 3 inches; width of petals, about 3½ inches. An authentic example of the old variety *Cattleya labiata rubra-Pescatorei*, exhibited by Mr. VAN IMSCHOOT—afforded a most interesting comparison—being absolutely identical with the beautiful forms of *Warocqueana*, but it was much inferior to the fine forms exhibited by Mr. WAROCQUÉ, to whom a special Gold Medal was unanimously awarded for his exhibition as a whole. To a specimen in the same lot, having one hundred pseudobulbs, eighty leaves, and forty-eight flowers, a Cultural Certificate was unanimously awarded. Amongst other exhibits may be mentioned, *Odontoglossum Inseayi splendens*, *Oncidium phalenopsis* and others, from Mr. A. VAN IMSCHOOT; the curious *Cypripedium Lindenii*, from Mr. PAWELS; *Cypripedium Moulmeinense*, and many others from Mr. DALLIÈRE; two fine *Cattleyas Warocqueana*, and the *Cypripedium albo-purpureum*, from Dr. CAUWELAERT; *Cattleya El Dorado* var. *Crocata*, from Mr. MARTIN CAHUZAC; *Dendrobium bigibbum*, from Dr. CAPART; a fine *Brassia finetiana*, a new species, with very attractive colours; *Cypripedium Rodigasianum* × *Burlingtonia granadensis-rosea*, delicate rose colour; a rare *Odontoglossum* var. *striatum*, with spots of dull red; *Dendrobium phalenopsis*, *Cypripedium tonsum*, and *C. Harrisianum*; *C. superbum*, from Mr. LINDEN, and lastly, a beautiful *Cattleya virginalis* from Mr. H. SCHMITZ.

CLIMBING NIPHETOS ROSE.—A German correspondent, advertising to an article on this subject at p. 424, says that, having procured plants from various nurseries (not specified), purporting to be of climbing habit, he has always found them destitute of that characteristic; and one German nurseryman is reported to have declined to execute an order, as he found no difference between the so-called climber and the ordinary form. This is a serious allegation, but one which demands the notice of Rose growers. It may well be that the climbing habit is not assumed at first.

PICEA PUNGENS AND P. ELGELMANNI: A CORRECTION.—By an unfortunate oversight we last week suffered a misprint to pass unnoticed, and one which completely misrepresented our meaning. *P. pungens*, especially in its glaucous forms, is greatly superior to *P. Engelmanni* for cultivation in this country.

THE EFFECTS OF ARTIFICIAL MANURING.—In some experiments by W. VON KNIEREIN on the effects of artificial manuring, which are reported in *Beidermann's Centralblatt*, the following substances were used, namely, gypsum, lime, potash, superphosphate, bone-meal, potash and superphosphate mixed, superphosphate and ammonium sulphate mixed. Compared with plots of similar soil, which were not treated with any manure, the plots that were so treated gave much more produce. In every case, except where superphosphate was used alone, the beneficial action of the manure extended to the second year's crop.

ASSIMILATION IN LICHENS.—Under favourable conditions of light, humidity, and season, all Lichens can decompose the carbonic acid of the atmosphere so energetically, that the quantity decomposed exceeds that evolved by the Lichen doing the process of respiration, and consequently the organism gains in carbon. The intensity of the assimilation of Lichens varies enormously, however, with the species, and is relatively strong with such Lichens as *Cladonia* or *Parmelia*, but is very feeble in the case of such Lichens as *Lecidea*, for instance. When all other conditions are equal, direct sunlight is much more favourable to the assimilation of carbon in these plants than is diffused light. These observations are due to Mons. H. JUELLE, who recently read a paper upon the subject before the Paris Academy of Science.

VANDA CÆRULEA, SANDERS' VAR. Ordinary *V. cœrulea* appears as a white flower, with veining and flushing of blue, but this grand variety reverses that order of things, and appears as a perfectly-formed, large, rather deep-blue flower, with a little spotting of white showing between the bright dark-lilac chequering, so clearly are the bars of colouring placed. One reason for the unusual predominance of blue in this over other forms is, that the reverse sides of the flowers are as dark and as brightly coloured as the front. The lip is violet coloured, with the upper part of the keels at the base white. The flowers are almost circular, 4½ inches across, the petals being 1½ inch in width. I have never seen anything like this variety for form and richness of colouring combined. It is now in flower with Messrs. F. SANDER & Co., writes Mr. JAMES O'BRIEN.

CYPRIPEDIUM INSIGNE BOHNHOPIANUM, NEW VAR.—In advancing this unique form, one has not to contend with the endless complication which arises among those with crimson spots, viz., those of the *Maulei* group. The chaste and lovely thing is entirely different. The labellum and petals have little to mark them from an ordinary *C. insigne*, except that the yellowish body-colour is suffused with a purplish-brown instead of the usual markings, and the staminate is rich yellow, with purple hairs at the back. But the sepals are the extraordinary features, and especially the upper one. The lower sepal is ovate oblong, and larger or longer than in the type. The dorsal sepal is large, flat,

and well displayed. The lower half has a circular area of pale purplish-brown; this, in its turn, is encircled by a ¼-inch wide band of emerald-green, and the remaining upper portion of the sepal is pure white, the white extending and narrowing downwards even to the base. There are no spots anywhere about the flower. It will be highly prized by some collectors of *Cypripedia*, and justly so, for it is handsome and distinct.

CHRYSANTHEMUM AND FRUIT EXHIBITION AT EDINBURGH.—The winter exhibition of the Scottish Horticultural Association, which is now looked forward to as one of the most attractive events of the year in Edinburgh, will be held in the Waverley Market from the 19th to the 21st inst., and promises to equal, if it does not surpass, all previous shows of Chrysanthemums. The fruit section will be a source of the greatest interest and attraction to our pomologists, as the Government of the United States have intimated through Mr. H. E. VAN DEWAN, the State pomologist, their intention to exhibit a collection of the fruits of the United States. As this is believed to be the first occasion on which such an interesting exhibit has appeared at any horticultural exhibition in Britain, it will be examined and criticised by pomologists and fruit growers with great care and zest, and will be an object of much attraction to the multitude who consume fruit. Intimation has also been received from the government of Nova Scotia, through Dr. GEORGE LAWSON, Secretary for Agriculture, to exhibit one of their splendid displays of the Apples for which that enterprising colony is so famed, and which of late years have been so well exhibited at the Edinburgh fruit shows. The fruit grown in the British Isles and the Channel Islands is also to be present in considerable force, so that to fruit growers and consumers the show is likely to afford a rare treat.

CONTINENTAL NOVELTIES.

ZINNIA DOUBLE-STRIPED PERFECTION.

THROUGH the kindness of M. C. LORENZ, seed grower, of Erfurt, we are enabled to afford our readers a figure (p. 587) of a very fine *Zinnia* of a distinct character. Hitherto, *Zinnias* have been "sells" in the sense of the flowers possessing but one colour, although in the colours of the varieties, there was much diversity. We have in the novelty figured a large and faultlessly-shaped flower, of a pure golden-yellow colour, elegantly striped with bright scarlet. The mixture of these two colours is very effective, and makes this a valuable variety for decorative purposes. About 70 per cent. come true from seed.

DOUBLE-FRINGED PETUNIA SUNSET.

ANOTHER of M. C. LORENZ'S novelties is the so-called double-fringed *Petunia Sunset*, a flower of carmine-rose colour, a distinct new colour of value for decoration purposes (see p. 589). The plant grows about 2 feet in height, and produces a great profusion of prettily-fringed flowers. During the sojourn of their Imperial Majesties the Emperor and Empress of Germany at Erfurt in September last, M. LORENZ decorated the imperial pavilion with this new variety, which excited much admiration.

HOME CORRESPONDENCE.

CHRYSANTHEMUM PROSPECTS AT WOOD-HATCH.—Having had occasion lately to visit these gardens, some account of the prospects for the coming season of so well-known a grower as Mr. Salter may interest many of your readers. The prevalent dampness in the air has, of course, affected the plants very much; this is especially seen in the flowers of the incurved varieties, but by unremitting care and attention, the affected blooms are being gradually got healthy again. The damp has not affected the *Anemone*-flowered varieties so much, and Mons. C. Lebosqz was bearing some magnificent blooms. Prominent varieties in the Woodhatch

collection are Mr. C. Orbard, John Lambert, E. Molyneux, Criterion, Casar Costa, Cullingfordi, Gloire de Rocher, Maiden's Blush, Etoile de Lyon, Val d'Andorre, M. R. Bahaunt, Refulgens, Count de Germiny. Of the new ones, W. H. Lincoln and Madame Prunard seemed the best. The bad weather has not affected the Pompons so much, and whoever beats Mr. Salter in these will have to be far above the average, some of the blooms of Black Douglas, Prince of Orange, and Rubra perfecta being as good as they can possibly be grown. *Vagabond*.

IRON v. WOOD IN GLASS-HOUSES.—In the last issue of your paper, I notice, under "Home Correspondence," an article on "Iron v. Wood Green-houses." Will you kindly allow us to draw attention to the fact, that to obviate the difficulty of radiation, &c., in iron-houses, as they used to be built years ago, which were entirely of iron, with sash-burs about 4 inches apart, ours are made with bars 18 inches apart, or about one-fourth the old number; and the woodwork is of the best red seasoned deal, unless otherwise ordered, which is completely covered

to condemn Mont Blanc rockeries. "H. E." has no doubt seen how well the little gems grow on the Alps, Pyrenees, and Apennines, where they can be seen in hundreds in almost every crevice. Surely this is a good lesson for us all. Why not imitate Nature as far as we can? why not make the garden picturesque with rockwork as well as alpine plants? In a well-arranged rockery, in the dead of winter, you can roam about without the assistance of a ladder such as "H. E." refers to. Then, again, you can have your Mont Blanc beautifully arranged with small evergreen shrubs and foliage plants, which will give your rockery a lively appearance in winter, when the alpine are mostly gone to rest; whereas, on "H. E.'s" principle, there would be nothing to look at but a cemetery. And I am afraid many ladies would object to ascend the heights of a ladder to look at a small plant in flower. About three years ago I had the pleasure of making a rockery for a gentleman on the Mont Blanc system, which has given every satisfaction. I mention this rockery in particular, because previously the gentleman had had one of his own construction, upon which he could never

result had they been planted in pockets or behind a slab? You can never see the beauty of a plant until it is fully developed, and develop the plant cannot in a small pocket. I might mention in conclusion, that the Saponaria to which I refer is planted behind the summit of a rock about 3 feet deep. Now the plant nearly covers the rock to the bottom, forming one mass of brilliant colour. Adjoining is *Lithospermum prostratum*, which covers with blossom a stone about the same size. Such features as these you can never expect to see where alpine are grown on "H. E.'s" principle. *W. A. C., York*.

SUBJECTS OF STUDY FOR GARDENERS.—I have been reading with interest the notes referring to the "subjects of study for young gardeners," and I thought that a few lines from a young gardener would not be out of place. It is needless to say, that if young gardeners wish to follow the footsteps of the best gardeners past and present, it is absolutely necessary to devote much of our spare time to study. We, too, have gardeners who set us good examples—a fact which Mr. F. W. Burbidge has commented upon. I think if young men would only take to the study of the various subjects relating to gardening, reading their *Gardeners' Chronicle* regularly and intelligently, they would acquire a still greater liking for it, and feel more eager to embrace every opportunity afforded them to such study. I can speak from experience, that evening study on topics relating to gardening is a pleasurable pastime, and when one's profession becomes a pleasure to them (as it ought to be), they are more likely to give satisfaction to the head gardener, and pay every attention to their duties, and consequently the head gardener can conscientiously recommend them to a worthier position. If we, as young gardeners, ever wish to attain a position where it may fall to our lot to have the management of extensive places, where a succession of fruit, flowers, and vegetables of high-class quality are demanded, as well as a well-kept pleasure-ground and flower garden, I feel sure we ought to waste but little time. Much can be learnt from this valuable paper by following it regularly, there being always something of interest brought to their notice, as well as a Calendar of operations for the week. I do not think too much can be said in favour of Cassell's *Popular Educator*, there being much matter in it of great value to gardeners, and written in a simple and clear way, so that if any one has a desire to learn at all, he cannot fail to do so. I think, too, it would help us young bothy men if space could be spared from week to week in this paper where we could discuss different gardening topics, or if papers on different subjects were allowed to be sent by young gardeners occasionally, and small prizes awarded for the best. It would be encouraging. *Bothnian*.

FIG. 81.—ZINNIA, DOUBLE-STRIPED PERFECTION: SCARLET AND GOLD. (SEE P. 586)

by the galvanised bars and glass, and thoroughly protected from weather, thus minimising radiation, &c., almost as well as in houses entirely of wood. This is really an important feature, and one apparently lost sight of in your correspondent's letter. *E. Newton & Co.*

ROCKERIES—I should have thought "H. E." would have been the last man in the world to condemn the so-called Mont Blanc system of rockwork. As "H. E." no doubt is well aware, there are many ways of constructing a rockery to grow alpine really well. I could mention several rockeries on the Mont Blanc system where plants will not grow, for the simple reason that the construction has been wrong. That is the commonest fault, and the reason why so many plants fail to grow. If the work has been done by a practical man, there is no fear but what the plants will do well, because every plant is in its proper position. If "H. E." wants to go in for quantity, why not grow them in pots and elevate them, in accordance with his views; they could be grown thus with far less labour than with the hideous-looking slabs, which resemble a churchyard far more than a flower garden. I think "H. E." is going away from Nature altogether when he tries

get anything to live longer than, on an average, about twelve months (I may mention that the gentleman's rockery was built on "H. E.'s" principle), for the simple reason that the pockets were not large enough to admit soil enough to keep a plant alive longer than that period. My experience is, give a plant room to grow, good soil and drainage, and the plant will overcome every trouble, and do well. There are more plants lost with too much nursing and coddling than in any other way. If people had to treat alpine as alpine, and not as half-hardy plants, they would find out much to their advantage in growing these little gems. I could give scores of instances to prove the truth of my statement. I might mention another piece of rockwork which was made this spring, and planted in May with plants, such as *Androsace carnea eximia*, *A. vitaliana*, *Anthyllis montana rubra*, *Saponaria ocyroides splendidissima*, *Arenaria Huteri*, and *Erodium guttatum* (the four last-named new plants were offered for the first time this year by James Backhouse & Son, York), *Polemonium confertum*, *Hypericum cuneatum*, *H. reptans*, *Lithospermum Gastoni*, and several other rare alpine. Most of the above covered a space of from 18 to 21 square inches with this summer's growth. What would have been the

This is a subject which has attracted my attention for several years past, and it has again been excited by the article on p. 489. If I may be permitted to express an opinion, I should say that any scheme which is not for the benefit of the present generation of gardeners, will eventually come in competition with them. With this in view, I should be in favour of lectures at local centres, with an examining body in London, organised and carried out on the lines of the Science and Art Department, as indicated in the *Principles of Agriculture*. I believe a large number of gardeners would avail themselves of such means of study, and the local centres might be in connection with, or in places where gardeners' mutual improvement societies already exist; and for text-books, some of the science primers recommended by Mr. Burbidge would be found very useful if there was some one appointed to explain how they link together, and to teach the principles of agri-horticulture. Until such time as lectures on gardening topics are given, I advise young gardeners who can attend lectures on the principles of agriculture to do so, in order to acquire an insight into the composition of soils, and the action of manures. *C. F.*

STREPTOCARPUS, NEW HYBRIDS.—I should like to say a word in favour of these pretty and interesting plants. I purchased a packet of seeds, and they were duly sown as directed on the cover, but they positively refused to germinate, either in a stove or intermediate house. But, after placing them in a hotbed, they came up, as gardeners say, "as thick as hail," and in due time they were placed in thumb pots, and the largest in 3 inch pots. Since the beginning of July, they have been flowering very freely, their *Gloxinia*-like blooms are very pleasing. The colours range from pure white through the various

shades of blue to red, and they are most useful for decoration in small vases. I have had flowers last quite three weeks in water. Lovers of interesting and pretty things could not do better than procure some seed. These *Streptocarpus* hybrids are of the easiest possible culture. *Walter Grace, Bickton, Fordingbridge.*

DAHURICUS—Mr. Baker has kindly explained to me the reason of this geographical specific name of plants, about which I asked a question last week, only because the name of the country which it denotes seems to have become obsolete in English atlases. The botanist Ledebour divided the Russian empire into ten botanical districts, of which Dauria, Davuria, or Dahuria is one. It lies to the east of Lake Baikal, extending to the frontier of the empire of China, say from 110° to 130° east longitude, and from 50° to 55° north latitude, the latitude thus corresponding with the southern portion of Great Britain. Though comparatively small, Mr. Baker remarks it is very rich botanically. *C. Wolley Dod, Edge Hall, Malpas.*

LILIUM OCHROLEUCUM.—In your last issue, Mr. Baker asks where Dr. Wallich described this Lily as "dull yellow." If he will refer to the *Gardeners' Chronicle* for August 25, 1855, p. 564, he will find a note respecting *L. nepalense*, with a reference to Wallich's *Plant. As. Rar.*, vol. iii, t. 291, under which figure Mr. Baker stated that Wallich included his *L. ochroleucum*. Dr. Lindley there wrote, doubtless on good authority, "According to Dr. Wallich, the flowers are dull yellow," adding, however, that it did not agree with the Lily then under notice, which was manifestly, from the description given of it, neither *L. nepalense* nor *L. ochroleucum*, but *L. polyphyllum*. I have not the privilege of being able to refer to Wallich's *Plant. As. Rar.*, so should esteem it a favour if Mr. Baker will kindly answer the inquiry made in my last communication, viz., whether the figure of the Lily in the above work, t. 291, bears more resemblance to the true *nepalense*, as figured in the *Garden*, than does the drawing of *nepalense* given in Mr. Elwes' *Monograph*, which was drawn by Mr. Fitch from the specimen of *L. ochroleucum*, Wallich? I would also call Mr. Baker's attention to the page illustration at p. 77 of the *Gardeners' Chronicle*, July 17, 1880; it is given as *L. nepalense*, but is really a very excellent figure of what Mr. Baker has named *Wallichianum superbum*. Perhaps the editor could inform us from what material the woodcut in question was produced. *J. M.* [It is too far back to trace. The drawing was by Mr. Fitch.]

COLOUR OF GRASS.—Wind-blown grass with a silvery hue is to me a fine sight; it is a finer quality than mere brilliancy of colour—but this appearance is not to be found in all grasses. How is this? I notice it chiefly, almost entirely, on clay soils; is this because special varieties grow there, or would the same species differ in this particular when grown on sandy or clay soils? *S. James.* [The colour would depend probably on the number and distribution of the stomata, and these again would vary according to the conditions under which the plant was growing. *Ed.*]

A GOOD CROP OF ONIONS.—I have grown at my place this year thirty-five bushels of Onions on 8 rods, and quite half the number of bulbs were fully 12 inches round, the largest coming off the lightest ground; and yet they say in most gardening books, give heavy soil for Onions to grow in. I suppose this is what may be called a good crop. I found it quite difficult to harvest them this year—nothing but wet weather week after week. *F. S. Fletcher, The Maples, Ottershaw, Chertsey.* [The crop amounted to 1 bushel of bulbs on each 7 square yards of land—a very good crop indeed. *Ed.*]

JERUSALEM ARTICHOKE.—Mr. Dod (p. 526) does not tell us who the botanists are who have long since corrected the error as to the native country of the Jerusalem Artichoke, nor where that country is. He also differs from De Candolle, Caspar Bauhin, Lindley, Loudon, Paxton, Steudel, Wood, and other American botanists as to its being a native of Brazil. All these say it is, but he says there is no *Helianthus* native of Brazil, and the two or three found in Peru are all of fruticose habit. Where is the fruticose habit of *Helianthus annuus*, a native of Peru? On the page indicated (590) of vol. v., De Candolle's *Prodromus*, the two fruticose plants there mentioned are neither of them natives of Peru, as Mr. D. would lead us to suppose, and sp. No. 36 (*H. tuberosus*) is there stated as a native of

Brazil, and has no synonym, either of Asa Gray or any other authority. Sp. No. 13 (*H. dromioides*) has three synonyms, none of which is *H. tuberosus*; and sp. No. 33 (*H. giganteus*) is also quoted by De Candolle as a distinct species, which it would be a serious libel upon Asa Gray to say that he made either of these non-tuberosus plants synonymous with *H. tuberosus*, if even their nationality would allow it. The *Helianthus*, as a genus, came over to Europe from America, and probably took their name Girasol to Italy. The Jerusalem Artichoke brought its Spanish name with it from Brazil, and it may be that it acquired the name Artichoki on the Continent before it came to our shores. It would be a mistake to take up your columns with what can be obtained from books, therefore Mr. Dod must refer to Pryor on popular names of plants for an answer to his questions, where he can be satisfied in the most of them, excepting, of course, Jerusalem Gourd, which Mr. Dod must say more about, before I say anything in disparagement of what I believe is a very old friend in disguise. I hope shortly to prove that the Jerusalem Artichoke was known to all the old Spanish writers on Peru as well as to Columbus, and I believe it to be mentioned by T. Hariot as a vegetable in Virginia, and possibly prove its greater right to the name of Potato than *Solanum tuberosum* with which it came to America, and being harder travelled further north into Canada. All American botanists (Asa Gray, of course, included), say the Jerusalem Artichoke is naturalised in hedge-rows and ends of fields, really escaped from cultivation, but all, except A. Gray, pledge themselves to Brazil as the native country; and probably he thought with me that Peru was nearer the mark. I was sanguine myself at one time, that they should be proved natives of Canada, and would gladly hail evidence of this, but the weight is so much against it. The earliest representation of the plant that I have seen is a subfruticose plant from Peru, but a very different part of South America than that to which Mr. Dod drew my attention at p. 590 of De Candolle's fifth volume of the *Prodromus*. May I ask also where the quotation at the end of my paper (p. 482), which was taken from the *Gardeners' Chronicle*, December 15, 1888, has been contradicted? *Wm. Etherington Dixon, November 3.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

CHRYSANTHEMUMS formed the subject of the great autumn competition and fete of the National Chrysanthemum Society opened on Tuesday last at the Royal Aquarium, Westminster, and, notwithstanding the past unfavourable season, there was a capital display of bloom. The cut flowers were not, as a whole, so large as those exhibited on previous occasions, although some very creditable examples were staged, while the groups showed a slight improvement on those of last year. It is to be regretted, however, that a more suitable place cannot be found for such a fine display, for in many parts of the building it was utterly impossible to discern the true colours of the flowers, so bad was the light. Apart from this, too, the incessant noise caused by the numerous other entertainments was by no means conducive to that pleasant quietude which should characterise all floral exhibitions.

THE SOCIETIES' COMPETITION.

This class, being open to Chrysanthemum and horticultural societies of the United Kingdom, is usually of an interesting character, although the entries on this occasion were not so numerous as might have been expected. The stipulations are, that forty-eight blooms, twenty-four Japanese, and the same number of incurves, shall be staged, the flowers to have been grown by members of the societies exhibiting. The leading prize, which consists of a Challenge Trophy and £10, the former to be held for the year by the President of the winning Society, was awarded to the Havant Chrysanthemum Society, the growers of the blooms being Mr. J. Agate, Mr. N. Fuller, Mr. C. Penford, Mr. C. Hoskins, and Mr. A. Payne. In this collection some of the flowers were very fine, particularly the Japanese, although a few of them had weak centres. Among the best were Sunflower, E. Molyneux, Mons. Berard,

Ralph Brocklebank, Madame J. Laing, G. W. Clarke, W. W. Coles, Gloriosum, Vivand Morel, and W. H. Lincoln. The incurved blooms were smaller than usual, but very solid, the best shown being Lord Wolseley, Empress of India, Princess of Teck, Queen of England, Violet Tomlin, Miss Haggas, Jeanne d'Arc, Hero of Stoke Newington, and Mr. Shipman. The 2nd prize was awarded the St. Neots Chrysanthemum Society, which won the leading honours last year, for a very creditable collection of blooms. In this exhibit some capital blooms of Etoile de Lyon, Boule d'Or, Florence Davis, Mons. Bernard, Lilian Bird, Vivand Morel, and Violet Rose, were noticeable among the Japanese varieties; while of the incurved kinds Violet Tomlin, Alfred Salter, Princess of Wales, Queen of England, Robert Cannell, and Golden Empress were very fine. It is only fair to say that there were but two growers, namely, Mr. J. Myra and Mr. Petfield, in this instance, against five in the case of the winning Society. The 3rd prize went to the Wimbledon Horticultural Society for a collection of well-grown blooms, the growers being Mr. C. Gibson, W. B. Faulkner, Esq., and G. Walker, Esq. In each case the flowers were fresh and well developed.

CUT BLOOMS.

Incurved.—The principal class in this section was that for forty-eight blooms, consisting of not fewer than twenty-four varieties. The entries were not very numerous, but among those who did exhibit the competition was somewhat keen. The leading honours fell to Messrs. W. & G. Drover, nurserymen, Fareham, who staged a collection of clean and solid blooms. The majority of the flowers were of uniform size, and the best being John Lambert, Lord Alcester, Jeanne d'Arc, Queen of England, Empress of India, Lady Carey, Princess Teck, Princess of Wales, Hero of Stoke Newington, and Violet Tomlin. Mr. J. Doughty, gr. to Mrs. Tomlin, Angley Park, Cranbrook, was awarded 2nd, for a scarcely less creditable lot, many blooms in this collection being very neat and compact; among others deserving of notice were Jardin des Plantes, Lord Wolseley, Empress of India, J. Lambert, Alfred Salter, and Pink Venus. Mr. R. Petfield, gr. to A. J. Thornhill, Esq., Diddington, Buckenden, came in 3rd, with a stand of large but somewhat loose blooms; Mr. W. G. Ray, Teynham, Sittingbourne, was awarded 4th prize; Mr. J. Agate, Havant, 5th, in this class.

For twenty-four incurved varieties, distinct, Mr. C. W. Knowles, gr. to Mrs. Chas. Egerton, Solna, Rochester, was placed 1st, for rather small though solid blooms. Conspicuous in this collection were Lady Harding, Empress Eugénie, Empress of India, Golden Empress, Barbara, Refulgens, A. Salter, and Mrs. Shipman. Mr. J. Myers, gr. to the Earl of Sandwich, Hinchbrook, Huntingdon, was awarded 2nd for a regular lot, among which Miss Haggas, Golden Empress, J. Doughty, and Prince Alfred were very good; the 3rd prize falling to Mr. A. Ivies, gr. to E. C. Jukes, Esq., Hadley Lodge, High Barnet, for a stand of neat blooms.

The best stand of twelve incurved varieties came from Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon, the blooms being very fine and even. The flowers were so regular that it is almost impossible to individualise any particular varieties, although Golden Empress of India, Mrs. Heale, J. Lambert, Lord Alcester, and Mrs. S. Coleman may be mentioned as being specially good. The 2nd prize in this class was gained by Mr. J. Douglas, gr. to Mrs. Whitbourne, Great Geareia, Ilford, for well-developed blooms; and Mr. H. Lees, gr. to the Duchess of Montrose, Sefton Lodge, Newmarket, came in 3rd, with creditable examples.

Mr. J. Myers, Hinchbrook, staged the best six incurved blooms, one variety only, the kind being Golden Empress; the flowers were large and yet compact. Mr. Shoemith followed a good 2nd, with well-grown examples of Lord Alcester; and Mr. Matthew Russell, gr. to Dr. C. Thews, Henfield, Sussex, was placed 3rd, with good blooms of Violet Tomlin.

Japanese.—As a whole the Japanese varieties were better than the incurved, and the competition somewhat keener. In the class for forty-eight blooms, in not less than twenty-four varieties, some excellent exhibits were staged, the best being those of Charles E. Shea, Esq., The Elms, Foots Cray; most of the blooms put up by this exhibitor were of a high-class character, M. Vivand Morel, Gloriosum, Annie Clibran, Condor, Danaë, Stanstead White, W. W. Coles, and E. Molyneux, being particularly fine. Messrs. W. & G. Drover were awarded 2nd prize for a stand of large blooms,

which, however, presented rather a ragged appearance; in this collection some excellent examples of the new hairy pink *Chrysanthemum*, *Louisa Boehmer*, were conspicuous, while Mrs. C. W. Wheeler, *Avalanche*, *Madame Baco*, *Sunflower*, and *Carew Underwood*, are also deserving of notice. The 3rd prize went to Herbert Fowler, Esq., *Claremont*, Esher, for smaller but well-grown blooms; Mr. H. R. Brown, gr. to G. D. Barclay, Esq., *Roydon Lodge*, was awarded 4th; and Mr. C. Cox, gr. to J. Trotter, Esq., *Brickenden Grange*, Hertford, 5th. In the three last-named competitors' stands some well-developed blooms were noticeable.

Mr. J. Agate, Havant, staged the best twenty-four varieties, distinct, and among others deserving of mention in this stand were *Gloriosum*, W. H. Lincoln, *Sunflower*, *Madame Baco*, *Bauty of Castlewood*, and Mrs. W. Wheeler. The 2nd prize in this class went to Mr. H. R. Brown, gr. at *Roydon Lodge*, for a brightly-coloured collection, conspicuous amongst which were *Condor*, *Belle Paule*, Mr. Garnor, and *Val d'Andorre*. W. Herbert Fowler, Esq., was placed 3rd for a fresh lot of blooms, which included a well-grown example of *Louisa Boehmer*.

Mr. A. Ocock, gr. to Mrs. McIntosh, Havering

Kingston Lisle Park, Wantage, was awarded 3rd for a very poor arrangement.

Large Flowered Reflexed.—There were very few entries in this section, but some good flowers were staged by various growers. Mr. J. Myers gained 1st honours for the best twelve blooms. Dr. Sharpe, King of the *Crimsons*, Putney George, and *Cloth of Gold* being very good in this stand. The 2nd prize was awarded to Mr. G. Carpenter, gr. to Major Collis Browne, Broad Oak, Byfleet; and the 3rd to Mr. Matthew Russell, Heathfield.

Japanese reflexed.—For twelve blooms of not less than nine varieties, Mr. C. Long, gr. to E. P. Oakshott, Orchard Dene, Ealing, was placed 1st; and Mr. R. C. Notch, Broughton Road Nursery, Ipswich, followed a close 2nd. In the first-named competitor's stand *Sunflower*, *Belle Paule*, *Criterion*, and *Mdlle. La Croix* were very good; while *Amy Furze*, *Maiden's Blush*, and *Gloire de Rocher*, a seedling of *Val d'Andorre*, were conspicuous in Mr. Notch's collection.

Large-flowered Anemones.—Mr. W. Green, gr. to Miss Wyburn, Hadley Manor, Barnet, sent the best stand of twenty-four blooms; and Mr. A. Ivies was placed 2nd, for a meritorious collection; while Mr. Myers came in 3rd.

FIG. 82.—PETUNIA, DOUBLE-FRINGED BRILLIANT CARMINE-ROSE "SUNSET." (SEE P. 586.)

Park, Romford, gained 1st honours for the best twelve blooms, this being a very good stand. The flowers were fresh and well-grown, particularly Mrs. J. Wright, M. Vivian Morel, J. Delaux, and *Fair Maid of Guernsey*. A remarkably fine bloom of Mrs. A. Hardy was also conspicuous in this collection. The 2nd prize went to Mr. W. H. Divers, gr. to J. T. Hopwood, Esq., *Ketton Park*, Stamford, and the 3rd to Mr. J. Doughty, *Angle Park*.

The best six white blooms were shown by Jas. Shaw, gr. to Lord Clinton Hope, *Deepdene*, Dorking, who staged good examples of *Avalanche*; while the 2nd prize went to Mr. C. Cox, for large blooms of *Stanstead White*. Mr. J. Hughes, gr. to the Hon. H. T. Paravicini, *Heathfield*, Brackering, was awarded 3rd prize.

The leading prize for six blooms, any colour except white, went to Charles E. Shea, Esq., for fresh flowers of *Etoile de Lyon*; while Mr. J. Douglas was awarded 2nd for good examples of *Sunflower*, and Mr. J. Hughes 3rd, for a stand of the same variety.

There were but two entries in the class for twelve Japanese blooms, distinct, the flowers to be staged with moss, ferns, or small foliage plants. The 1st prize went to W. Howe, gr. to Henry Tate, Esq., *Park Hill*, *Streatham Common*, for a stand of fresh blooms, shown well above a groundwork of *Maiden-hair Fern*; while Mr. F. Sutton, gr. to J. Taylor,

Large Anemones.—In the class for twelve blooms, Japanese included, Mr. W. Green staged the best stand, which included fresh and well-grown examples of *Lady Marguerite*, Mrs. Judge Benedict, and *Madame R. Owen*; the next best lot came from Mr. Ives; and Mr. C. Notcutt had the 3rd prize.

Japanese Incurved.—Mr. R. Petfield sent the best stand of twelve blooms, among which *Boule d'Or*, Mrs. C. Wheeler, and *Madame Audiguer* were conspicuous; Charles E. Shea, Esq., gained the 2nd prize in this class; and to Herbert Fowler, Esq., 3rd, the blooms in each case being well-grown.

Anemone Pompons.—These were poorly represented, so far as entries were concerned, but some fair blooms were staged by Mr. J. Myers, to whom the 1st prize was awarded; Mr. E. J. Salter, gr. to T. B. Haywood, Esq., *Woodhall Lodge*, Reigate, gained the 2nd prize for twelve blooms; and the 3rd was awarded to Mr. W. B. Carpenter, *Gravesend*.

Pompons.—Neither were these so plentiful as might have been expected, although those staged were of good quality. For the best twelve blooms Mr. C. J. Salter gained 1st prize, the 2nd and 3rd being awarded Mr. G. Duncan, gr. to C. T. Lucas, Esq., *Warnham Court*, Horsham, and Mr. Matthew Russell, *Henfield*, respectively.

Amateurs' Metropolitan Classes.—Nine classes were provided for amateurs and single-handed gardeners, and among these some creditable stands were

noticeable. The best were staged by Mr. F. Laughey, *Wattford*; Henry Fincham, Esq., *Cranbrook*; Mr. J. Horril, *Havant*; Mr. J. Heath, gr. to M. Gurry, Esq., *Abington Place*, *Newmarket*; Mr. J. Little, gr., *The Gardens*, *Rylands*, *Romford*; Mr. W. Jones, gr. to W. Hooper, Esq., *Glenamont*, *Sutton*; and E. Mawley, Esq., *Rosebank*, *Berkhampstead*.

The Metropolitan classes were open to competitors residing within a radius of 3½ miles of *Shoreditch Church*, and considering the conditions under which they had been grown the blooms staged were very creditable. The best stands were shown by Mr. F. Bingham, *Stoke Newington*; Mr. W. Beech, gr. to L. Seligmann, Esq., *Hereford House*, *South Kensington*; Mr. W. Davey, gr. to C. C. Paine, Esq., *Cedar House*, *Stamford Hill*; and Mr. E. Easy, gr. to J. W. Jones, Esq., *Highbury New Park*.

GROUPS AND POT PLANTS.

As has been said, the groups of plants were better than those staged last year. The leading group of *Chrysanthemums*, any varieties, was exhibited by Messrs. Reid & Bornemann, *Sydenham*, to whom the 1st prize was awarded. The plants were well-grown, and the blooms, though not particularly large, were well finished. Mr. G. Stevens, *St. John's Nursery*, *Putney*, followed closely with a fine group, the 3rd prize going to Mr. N. Davis, *Camberwell*. Messrs. Reid & Bornemann also staged a capital group of Japanese varieties; and for a group of *Chrysanthemums* and foliage plants, Mr. E. Easy gained 1st honours for a light arrangement.

Trained plants were very good, the best four specimens coming from Mr. D. Donald, gr. to J. G. Barclay, *Leyton*. The same exhibitor was also 1st for six and four trained standard specimens respectively. Mr. J. Brooker, gr. to W. Reynolds, Esq., *The Grove*, *Highbury*, N., staged the best six large-flowered specimens. Other prize winners for trained plants were Mr. W. Davey, *Stamford Hill*; Mr. J. Weaton, *Claysham Park*; Mr. W. Robinson, and Mr. E. Easy.

SPECIAL PRIZES.

Special prizes were offered by Messrs. J. Laing & Sons, *Forest Hill*; Mr. R. Owen, *Maidenhead*; Messrs. H. Caonell & Sons, *Swanley*; Messrs. Pitcher & Manda, *Hextable*; Mrs. Myers, *Carnworth*; and Mr. H. J. Jones, *Lewisham*. In several of the classes thus provided, however, there was no competition. Messrs. W. & G. Droyer took the 1st honours for six blooms of *Louisa Boehmer*, as also did Mr. Charles Blicke, gr. to Martin R. Smith, Esq., *The Warren*, *Hayes Common*, *Beckenham*; Mr. G. Foster, gr. to W. Hammond Spencer, *Glendaragh*, *Teignmouth*; W. Herbert Fowler, Esq., and Mr. T. Aplin, gr. to W. Meath Baker, Esq., *Gloucester*. The *Gardeners' Magazine* Medals were won by Mr. H. Shoosmith and Mr. Ocock.

TABLE DECORATIONS AND BOUQUETS.

There were but few entries in this section, and in some cases the exhibits staged were not of a very high-class character, though those put up by Messrs. Perkins & Co., *Coventry*; Mr. E. Chadwick, gr. to E. N. Nelson, Esq., *Hanger Hill*, *Ealing*; and Mr. R. Potter, gr. to Sir M. W. Collet, Bart., *St. Clare*, *Hensing*, *Sevenoaks*, were really good. These exhibitors were awarded 1st prizes in various classes.

MISCELLANEOUS.

Mr. H. J. Jones, *Ryecroft Nursery*, *Lewisham*, staged a grand group of single *Chrysanthemums*, which attracted much attention. The plants were well-grown, and covered with bloom. From the same grower came an extensive collection of new varieties, comprising the principal continental and English-raised novelties, some of which appeared to be of real sterling value. Messrs. Pitcher & Manda also staged a number of *Chrysanthemum* blooms, as likewise did Mr. T. S. Ware, *Tottenham*; Messrs. Carter & Co., *High Holborn*; Mr. R. Owen, *Maidenhead*, and M. W. Wells, *Redhill*. Messrs. J. Laing & Sons sent a representative collection of fruit and *Chrysanthemums*; while from Messrs. Cannell & Sons came a showy group of cut flowers, comprising zonal *Pelargoniums*, *Louisa Boehmer Chrysanthemums*, &c. Mr. Whillans, gr. to the Duke of Marlborough, *Blenheim Palace*, staged a fine group of *Caruations*; and Messrs. Cobush & Sons, *Highbury*, foliage plants. Flower-pots and fancy vases were exhibited by Messrs. W. S. Iles & Co., *Camberwell Park*; greenhouses by Messrs. Haywood & Co., *Brockley*; and audries by Mr. J. George, *Putney*.

FRUIT AND VEGETABLES.

Fruit was sparingly shown, compared with other years, but that staged was well finished.

Mr. G. Goldsmith, gr. to Sir Ed. Loder, Bart., Leonards Lee, Horsham, had the best six dishes of dessert and culinary Apples; while the leading prize for Pears went to the same grower.

Mr. W. Harman, gr. to the Earl of Darnley, Wenhams Paddock, Lutterworth, was awarded 1st for White Grapes, this exhibit being some well-coloured Muscats.

The best black Grapes were staged by Mr. C. Giffen, gr. to Miss Christy, Coombe Bank, Kingston; and Mr. W. Wilson, The Elms, Roehampton. Mr. G. Duncan, Warnham Court; Mr. J. Bowry, Forest Hill; Mr. W. Howe, Streatham Common; F. Craven, Potter's Bar, F. Davis, Castle Bar, Ealing, also took prizes for Grapes. Messrs. Cheal & Sons, Crawley, sent a large collection of highly-coloured Apples.

Collections of vegetables for the special prizes offered by Messrs. Sutton & Sons, Reading, and Messrs. Webb & Sons, Stourbridge, were very good, the leading prizes being taken by Mr. R. Lye, Newbury, and Mr. A. Miller, Royal Ashton Park, Trowbridge. The Potatoes, too, staged in competition for the prizes given by Mr. C. Fidler, Reading, and Mr. Whitehead Cousins, Covent Garden, were of first-rate quality, particularly those shown by Mr. E. S. Wiles, Banbury; Mr. A. Miller, Mr. Peckover, Banbury; and Mr. H. Ridgewell, Cambridge.

CERTIFICATES.

A meeting of the Floral Committee took place in connection with the great show, and a very large number of flowers was staged, especially of the Japanese varieties; probably some 500 blooms of new varieties were submitted for Certificates. A First-class Certificate of Merit was awarded to Japanese Comte de Galbert, a grand new variety of great beauty of a pale blush colour, large and full. This came from M. Ernest Calvat, Grenoble, a French raiser, who has succeeded in obtaining some new varieties. Exposition de Grenoble, a very promising variety of a high colour, the Committee wished to see again. Other varieties were much damaged in the course of the journey.

Messrs. James Carter & Co., Holborn, W.C., sent a number of seedlings. First-class Certificates of Merit were awarded to Lord Brooke, a very fine golden-orange incurved Japanese; Holborn Rose was much admired, but it was thought not to be sufficiently distinct.

Messrs. Pitcher & Manda, Hextable, Kent, received a First-class Certificate for Japanese Miss Libby Allen. A large yellow incurved Japanese of excellent character, and a yellow form of Louis Boehmer, the Committee wished to see again. A First-class Certificate was also awarded to large Anemone Delaware, a fine variety, the guard petals white, with yellow centre. A large batch of new varieties came from Mr. R. Owen, Maidenhead, who received a First-class Certificate of Merit for Excelsior, a large bright crise Japanese with a silvery reverse; Japanese Mrs. G. C. Schwabe, delicate rose, shaded with salmon, and tipped with gold, very distinct; and Mrs. Robinson King, a golden incurved of good colour, and fine petal and build. Mr. T. W. Flight, a Japanese, the committee wished to see again.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, sent some seedlings. Among them was Amos Perry, an incurved Japanese in the way of Thunberg, but paler (Commended). A First-class Certificate was awarded to Japanese Florence Davis, a very fine and distinct pure white variety, raised by Mr. Norman Davis, of Camberwell, and shown in admirable character. Mr. Mursell, Streatham, received a First-class Certificate of Merit for Kate Mursell, a pure white sport from Lady Trevor Lawrence; and for Coronet, a large and very fine deep orange-yellow incurved Japanese, of great beauty.

A large batch of new varieties came from Mr. H. J. Jones, of Lewisham, of a very promising character, which the committee wished to see again in better condition; Miss Libbie Allen was also in Mr. Jones' collection. From Mr. Milford, Worcester Park, came Ada Kaye, a sport from Glück, Anemone-flowered, which the Committee wished to see in better condition. Some very fine blooms of Louis Boehmer came from Mr. H. Loader, and were awarded a First-class Certificate; and a batch of plants of the same variety, in pots, of fine quality.

First-class Certificates of Merit were awarded to Mr. James Lye, Clyffe Hall, Market Lavington, for two seedling Potatoes of high character, and a round variety, a refined Schoolmaster named Advance, and kidney Renown of the Lapstone type, but tinted with

red at the broad end. Also to Mr. A. J. Harwood, Colchester, for Colchester Black Bullace, shown in large clusters of fine ripe fruit. Apple Graham's Jubilee was shown by Mr. H. Pocock, and highly commended.

ROYAL HORTICULTURAL.

TUESDAY, Nov. 10.—The usual fortnightly meeting was thinly attended, owing to the attractions of the Chrysanthemums at the Aquarium. Those, however, who visited the Drill Hall, found a good group of Chrysanthemums, from Mr. Wythes, showing what can be done in so smoky a locality as Syon. The collection from Kew was chiefly remarkable for the very great beauty of some of the single forms, which put to shame some of their more-flaunting companions. There was an interesting collection of Orchids, including the inevitable *Labiata autumnalis* and other exhibits specially noticed elsewhere. A flower of the *Stapelia gigantea* figured at p. 728, Dec. 22, 1888, attracted—as well it might—great attention. Mr. Lynch showed from the Cambridge Botanic Garden a spray of the elegant Creeper, *Porana paniculata*, *Aristolochia grandiflora*; and Mr. Wythes showed *Bignonia venusta*. The Fellows greatly appreciate Mr. Lynch's exhibits on these occasions. Would that the managers of other Botanic Gardens would follow the lead of Kew, and send up to these meetings any interesting species they may have. They form so delightful a change from the interminable series of Chrysanthemums, *Gladiosi*, *Narcissi*, or what not. Mr. Ingram's lecture on "Soils" was read by the Secretary, and consisted, in the main, of an enumeration of the principal kinds of soil found in this country, of the rocks whence they have been produced, and of the causes—water, frost, air, ice, &c.—which have been instrumental in their production.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. B. Wynne, H. Herbst, H. Cannell, W. B. H. Poe, H. H. Dombain, C. E. Pearson, W. Watson, C. Jeffries, T. Baines, C. T. Drury, G. Paul, and J. Fraser.

Some few competitive exhibits of Chrysanthemums appeared in response to the invitation of the Society, and had it not been for these the Hall would have worn a very bare appearance. Six bush plants disbudded, and six not disbudded were desired, and Mr. E. Vince, gr. at Highgate Cemetery, was 1st in the former competition, with excellent plants, $3\frac{1}{2}$ feet high and 3 feet in breadth, with very good flowers, fairly abundant; the best were, Avalanche, Madame Rendatler, M. Berard, Madame Lacroix, and Peter the Great. The plants had the rather rare furnishing of foliage to the base of the stems, and were probably two years old. Mr. J. Weston, gr. to D. Martineau, Esq., Clapham Park, was 2nd, Madame Sévin and Avalanche were his best.

In the unthinned class, Mr. Vince was 1st, with the varieties Mons. Lacroix, W. Holmes, Phœbus, Lady Selborne, Source d'Or, bearing numerous flowers—of course, of a much smaller size than those in the other class, but very decorative objects withal. 2nd in this class was Mr. J. Weston, but his plants were immoderately tall and bare of leaves, although in some instances there was plenty of bloom. Mr. Pince showed six Pompons, nice plants full of flowers, Cendrillon and Sœur Mélanie being the best.

In non-competitive groups, we observed one of Chrysanthemums from the Royal Gardens, Kew, some of which were single-flowered, namely, Mary Anderson, Gus Harris, and Miss Rose, all profusely bloomed and showy. Others consisted of Japanese varieties grown without flower disbudding.

Mr. G. Wythes, gr. at Sion House, Brentford, showed tallish well bloomed plants, of some very fine varieties of Japanese and incurves, many of the individual flowers being of exhibition proportions and quality. The plants generally carried from two to four flowers each, that were wonderfully fresh looking for this, around town, rather forward season.

Messrs. J. Carter & Co., 237-238, High Holborn, exhibited Chrysanthemums, Holborn Rose, a large flat petalled mauve-coloured Japanese, Holborn Dragon, an imported Japanese, incurved florets, white with a tinge of pink on the reverse side; Miss Bella Weston, an English seedling incurved, the flowers shown being in some cases from crown, and in others from terminal buds.

Messrs. Cannell & Sons, Swanley, had a large stand filled with blooms of the hairy variety Louis Boehmer. It is a roughish flower, of a dull lilac

colour, with too much green eye noticeable, although that is not always present, as we remarked later in some stands in the National Chrysanthemum Society's show. A Japanese, Colonel B. Smith, of the favourite orange colour, with involved and incurved florets, came also from Swauley; it is a good thing.

Mr. J. Weston showed Pompon Ethel Weston, a pale pink flower with a yellowish centre, a sport from Rosenante. An incurved flower, Mrs. Rowlands, came from Mr. Rowlands, gr., Bardney Manor, Lincoln; and a white Japanese variety, Florence Davis, was shown by Messrs. J. Veitch & Sons, Chelsea. It has confused narrow flat florets, which have a green tinge about the centre of the bloom.

Besides the *Porana*, *Aristolochia*, and *Bignonia* mentioned previously, another very handsome flower, *Gerbera Jamesoni* was sent by Mr. Lynch, of the Cambridge Botanic Garden. It had been gathered from the foot of a south wall which is overhung with glass; there were also from this garden some flowers of the botanically-curious *Narcissus viridiflorus*, a native of Spain and N. Africa. Mr. C. Wood, gr. to Lord Hylton, Merstham, showed *Stapelia gigantea*, figured in these pages in 1887, a rare and interesting subject, with a purple flower, and large fleshy calyx, 10 inches in diameter, of great substance, and banded closely with fine crimson lines. Messrs. Peter Barr & Sons, Covent Garden, showed *Aster grandiflorus*, a bright-coloured, purplish-flowered species, the blooms measuring 2 inches in diameter. A cluster of the rich orange-coloured *Bignonia venusta* came from Mr. G. Wythes. It is remarkable that the plant from which the blooms were cut is sixty years old. Some of their beautiful crosses and hybrids of *Javan Rhododendrons*, came from the nurseries of Messrs. J. Veitch & Sons, and amongst them a novelty in the shape of a semi-double flower, of a pleasing salmon tint, and at present it is without a distinctive name. A Croton named Mrs. Usher with bold yellow markings, chiefly in the middle and lower half of the erect leaves, which are 7 inches long by $1\frac{1}{2}$ broad, came from the raiser, Mr. J. Smith, gr. to R. E. Warburton, Esq., Arley Hall, Cheshire. A distinct showy variety, and a good candle-light colour.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. John Lee, R. Hogg, R. D. Blackmore, G. Eynyard, G. W. Cummins, P. Willard, C. Ross, W. Warren, T. J. Saltmarsh, G. Chiffa, G. Wythes, J. Hudson, G. Reynolds, F. Q. Lane, H. Balderson, G. Norman, J. Smith, Harrison Weir, W. Bates.

A large assortment of Carrots came up from the society's garden at Chiswick, which had been arranged into eight sections, a convenient division for those little acquainted with the diversity of form in this root.

Group 1 contained the knobby forcing varieties, of which Parisian Red and the Forcing Horn are types; 2 is a slightly larger section, of which Carter's Improved Horn is typical; 3, are the roots of the cylindrical, Carentan type; 4, are thicker than the former, but not much, if any, longer, Gueraude and Chantenary Carrots are types of this; section 5 consists of roots longer than those in section 4, but less in diameter, like Carter's Scarlet Intermediate; 6 are mostly Carrots of about the same length as the preceding, but thick, like the English Horn; 7 is a longer form of Horn, with the St. Valery as the type; and 8 includes our Long Surrey, Altricham, &c.

An excellent lot of Pears (thirty-one dishes and varieties) came also from Chiswick, and included many not yet common in gardens, namely Onondago Bouvier Bourgeois, Oken d'Hiver, Helotto Dundas, a bright-looking fruit; Charlotte de Bromes, a fine-flavoured fruit; Louis Gregoire and Comte de Paris. The best flavoured Pear was White Doyenné, and the next, perhaps, Marie Louise.

Many seedling Apples were sent by various growers, but none met with approbation from the judges, except Messrs. Saltmarsh & Sons' Chelmsford Wonder, a large yellow-skinned fruit, and Colonel Eyres' Atalanta, a seedling raised by Mr. Ross, received an Award of Merit. It is a cooker.

Mr. Myles, gr. to Lady Hutt, Appley Towers, Isle of Wight, showed the black Grape, Appley Towers, a seedling raised at that place, and not seen now for the first time. It resembles somewhat Black Alicante, and is a lightly shouldered good-looking bunch. How large it may be grown we do not know. He showed a white delicate-looking Grape, said to have been raised from Gros Colmar and Black Alicante.

A few dishes of fruit came from Messrs. W. Paul & Son, Waltham Cross.

Some Leeks blanched to a great length of stem, and some very fine stout curled Parsley, and Marigolds, came from Messrs. Dobbie & Co., Rothesay, N.B.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. H. M. Pollett, Hugh Low, E. Hill, F. Sander, H. Ballantine, H. Williams, J. O'Brien, M. T. Masters, T. B. Haywood, and A. H. Smee.

Messrs. J. Veitch & Sons, Chelsea, exhibited another handsome hybrid Orchid, raised at their establishment by Mr. Seden, *Phaius maculato-grandifolius* × (*maculatus* ♂, *grandifolius* ♀); the plant had the general habit of *P. grandifolius*, but the leaves were rather thinner than those of that species, and exhibited a few yellowish spots, as in the male parent. The spike was nearly 3 feet in height, and bore flowers as large as those of *P. grandifolius*, the sepals and petals yellow, with a slight coppery tinge; the lip yellow at the base, the in-folded front lobe being chestnut-red, and lines of the same colour extending to the base of the lip. A very handsome species of a colour much needed. Messrs. Veitch also exhibited a flower of *Cypripedium Niobe superbum* × (*Spicerianum* ♀ × *Fairrianum* ♂), a still more beautiful form of the variety previously certificated, the rich purple and white of the dorsal sepal being very showy. Baron Schroder, The Dell, Egham (gr., Mr. H. Ballantine), exhibited the beautiful *Cypripedium insigne Sanderæ*, an unique form in which the flowers are of a clear shining yellow, except the upper part of the dorsal sepal, which is white. The flower is unspotted, and not marked in any way, and is a very charming novelty.

Messrs. F. Sander & Co., St. Albans, sent a handsome new species of *Dendrobium*, named *Leeanum*, which appeared as a single specimen it is feared among their importation of *D. Phalenopsis Schroderianum*. The plant had tall slightly compressed pseudobulbs, like those of *D. taurinum*, and stout ascending spikes of flowers larger than those of *D. superbiens*; the sepals white, with a rosy purple mottling on the outer halves, the petals rich rosy-crimson, and the front lobe of the lip, which has several distinct wavy ridges down the centre, was of the same colour, the base of the lip greenish—a very fine and distinct species.

Mr. Sander also sent the new *Cypripedium Malyanum* × *Spicerianum* ♀ × *Crossianum* ♂, a singular variety, with some resemblance to *C. Leeanum*, but without the purple spotting.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., staged a very cheerful-looking group of Orchids, to which a Silver Banksian Medal was awarded. Among the fine *Cypripediums* were *C. Morganæ* ×, *C. euryandrum* ×, *C. Arthurianum* ×, with five flowers; *C. Adonis* × (*Spicerianum* × *Harrisonianum*); and several forms of *Cypripedium insigne*, of which some good plants of *C. i. punctatum violaceum*, one with four and one with six flowers, were the best and showiest. Messrs. Williams also had plants in flower of *Odontoglossum grande*, exceptionally good varieties; *Lycaste Skinneri*, with five flowers; *Oncidium varicosum*, *O. tigrinum*, *O. Kramerii*, good plants of *Dendrobium formosum giganteum*, &c.

The Right Hon. Lord Rothschild, Tring Park (gr., Mr. E. Hill), exhibited a life-size photograph of a noble specimen of a fine variety of *Vanda cerulea*, with seventeen spikes, and over 200 flowers, which recently flowered at Tring Park. A special vote of thanks was accorded.

M. S. Cooke, Esq. (gr., Mr. D. Cullimore), Kingston Hill, sent a supposed hybrid *Odontoglossum*, of handsome form, the flowers about 2 inches across; the sepals and petals of a bright yellow colour, spotted with reddish brown; the lip white, with a few purple spots. (Award of Merit, subject to its being named or verified.) Messrs. Paul & Son, Cheshunt, exhibited an interesting series of nine varieties of *Cypripedium insigne*, among which *C. i. Chantinii*, *C. i. Mooreanum*, and *C. i. albo-marginatum* were the more distinct ones.

H. M. Pollett, Esq., Fernside, Bickley, Kent (gr., Mr. T. Paterson), staged a plant, and cut flowers of three varieties, of the old autumn-flowering *Cattleya labiata*.

List of Awards.
ORCHID COMMITTEE.

First-class Certificate.

- To Messrs. Veitch & Sons, for *Phaius maculatus grandifolius*.
- To Messrs. F. Sander & Co., for *Dendrobium Leeanum*.
- To Baron Schroder, for *Cypripedium insigne Sanderæ*.

Award of Merit.

To Malcolm S. Cooke, for *Odontoglossum hybrid*, to be named.

Silver Banksian Medal.

To Messrs. B. S. Williams & Son, for Group of Orchids.

FLORAL COMMITTEE.

First-class Certificate.

- To Mr. R. J. Lynch, for *Gerbera Jamesoni*.
- To Mr. C. Wood, for *Stapelia gigantea*.
- To Messrs. B. S. Williams & Son, for *Rhopaloblabe hexandra*.

Award of Merit.

- To Messrs. Barr & Son, for *Aster grandiflorus*.
- To Messrs. H. Cannell & Sons, for *Chrysanthemum Colonel W. B. Smith*.
- To Messrs. J. Carter & Co., for *Chrysanthemums Holborn Rose and Miss Belt Wilson*.

MEDALS.

Silver Banksian.

To Mr. G. Wythes, for group of *Chrysanthemums*.

Bronze Banksian.

To Messrs. H. Cannell & Sons, for *Chrysanthemums* (cut blooms).

FRUIT AND VEGETABLE COMMITTEE.

Bronze Medal.

To Messrs. Dobbie & Co., Rothesay, N.B., for collection of Vegetables.

First-class Certificate.

To Messrs. Saltmarsh & Sons, Chelmsford, for Apples, Chelmsford Wonder.

Award of Merit.

To Mr. C. Ross, for seedling Apple, Atlanta.

Cultural Commendation.

- To Lady Hutt, Appley Towers, Kyle (gr., Mr. T. Myles), for Grape, Appley Towers.
- To Mr. Barron, Royal Horticultural Society's gardener, Chiswick, for collection of Carrots.

IPSWICH AND EAST OF ENGLAND HORTICULTURAL.

TUESDAY, November 3.—The exhibition of the Ipswich and East of England Horticultural Society has by this time assumed the definite character of a grand festival of flowers and music. There was on this occasion not only a larger and more lovely display of blossom and foliage than has perhaps ever been seen before, but the arrangement was better and more artistic, and the incidental decorations of the room were a very pretty variation upon the style hitherto adopted. The coveted Silver Medal of the National Chrysanthemum Society, for the best single bloom in any amateur's collection, was won by Mr. M. Gurry, of Abington Place, Newmarket, with a very fine white flower of *Queen of England*, which he showed among the six incurved specimens which took 1st prize. Mr. R. B. Cabbell, of Cromer, took the handsome cup offered by Mr. Wm. Colchester, of Ipswich, for the best Japanese blooms grown or fed with pure Ichthemic guano. The whole twenty-four were of enormous size, some rather coarse; but specimens of *Molyneux*, *Val d'Andorre*, and *Oondor* were worthy of high praise. With all respect to the exhibitors of cut blossoms, however, more credit is undeniably due to those who can produce a good group of plants, and in this competition the first place is well earned by the Rev. H. A. Berners, of Harkstead Rectory. Mr. R. M. Miller took the 2nd prize, with a very nice and attractive lot. For collections not exceeding 40 square feet, Mr. E. R. Turner deservedly took the 1st prize, with a very nice collection, among them being a fine specimen of *Stanstead White*. Mr. J. D. Cobbold was 2nd.

The trained and single specimen *Chrysanthemums* were poor indeed, in comparison with the rest of the show.

Groups.—There were five groups of plants arranged for effect, which formed an attractive feature of the exhibition. Major Howey, of the Grange, Woodbridge, took 1st prize with a number of good specimens, which were very lightly and artistically put together. The 2nd prize went to Mr. W. Beer for a bright, varied, and useful lot of furnishing stuff. The *Primulas*, which were not remarkable, helped to adorn the fruit room; there were good plants for table decoration in between the cut *Chrysanthemums*, and Mr. George Gilbert, of the Floral Nurseries, Ipswich, took the 1st prize for specimen foliage plants, with a grand *Paeonium tenax*.

Cut Blooms.—The cut *Chrysanthemums* occupied most classes, and comprised many blooms of great size and beauty of form. The *Duchess of Montrose* headed the list with the best incurves. Against strong competition, Mrs. Lowe, of Gosfield Hall, Halstead, Mr. R. Burrell, of Westley Hall, Bury St. Edmund's, and Mr. R. C. Notcutt, of the Broughton Road Nursery, Ipswich, succeeded in taking minor awards. The Rev. H. A. Berners came in 2nd with a good collection of 24 Japanese and incurved.

Fruit.—The display of fruit was very good, especially in Grapes, Apples, and Pears. Lord Rendlesham showed the best collection, and had splendid Grapes (black Alicante) and Doyenné du Comice Pears. C. H. Berners, Esq., Woolverstone Park, gr. Mr. Sheppard, came 2nd, and the Hon. W. Lowther, 3rd. Mr. H. Berners and the Rev. H. A. Berners were respectively 1st and 2nd for white Grapes.

Messrs. Daniel Brothers, the Nurseries, Norwich, showed largely Potato and Apples, and Mr. F. Cresswell, gr. at Stoke Park, showed well in this section.

PORTSMOUTH CHRYSANTHEMUM SHOW.

NOVEMBER, 4, 5, 6.—Another very successful exhibition has to be chronicled by the Chrysanthemum Society of Portsmouth and neighbourhood as having been held in the Drill Hall in Alfred Road, on the dates above given. This building affords ample space for exhibits and the public alike; and in few towns is there such an interest in flowers generally and especially in *Chrysanthemums* by all classes as here. The managers of the society find in the cheap price charged for admission a most satisfactory addition to its funds; and to such an extent do they carry this idea, that one penny only is charged for admission during the last three hours the exhibition remains open, and as large a sum as twenty-five pounds has been taken at the doors in pennies.

Cut Blooms.—These form the strongest characteristic of the show, no fewer than 2,600 being staged, and the competition in the leading classes as a consequence was very marked. The principal class was one for forty-eight, half incurved and half Japanese varieties, and in not less than eighteen varieties. The 1st prize in this class was a piece of plate value £25, to which £8 in money was added, the conditions being that it should be won twice consecutively or three times in all. Messrs. W. and G. Drover, nurserymen, Fareham, were the most successful exhibitors in 1890, and repeating their success this year, they secured the award, which is now theirs solely. This stand was doubtless the best—as a whole—that we so far have seen this season. The incurved were large, fresh, and well finished, and included *Golden Queen of England*, the premier incurved in the show. The Japanese were large and very fresh, and consisted of some novelties in part. Mr. A. Payne, gr. to Mrs. E. Smith, The Oaks, Emsworth, was winner of the 2nd place, and his Japanese were very good. For twenty-four distinct varieties, twelve to be Japanese and twelve incurved, several valuable prizes were offered, with the result that a good display in this class resulted. With very fine incurved and fairly good Japanese, Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Wickham, was 1st, and Mr. Payne 2nd.

Twelve incurved blooms in as many varieties: 1st, Mr. Penford, gr. to Sir F. FitzWygram, Bart., M.P., Leigh Park, Havant, with blooms of medium size; Mr. C. Steptoe, gr. to W. A. Gale, Esq., Horndean, was 2nd.

Reflexed flowers made a good display, and Mr. Penford had here the best twelve in eight varieties, each flower being excellent; Mr. Russell, gr. to Dr. C. F. Lewis, Henfield, Sussex, was 2nd. Separate classes were provided for large *Anemone* and for Japanese-*Anemone* blooms, which also produced good competition, and made a display of much interest: Mr. Penford was again 1st in each class; with Mr. Steptoe 2nd in the former, and Mr. Adams, gr. to T. S. Edgecombe, Esq., Hinton House, Southsea, 2nd in the latter.

Pompon varieties, always pretty, were also numerously shown. Mr. Russell had the best, a choice selection; and Mr. Agate, Havant, 2nd. Fimbriated varieties were shown in triplets, Mr. Laphorne, gr. to Mr. Hawkins, Gosport, taking 1st place for twelve bunches. Five competed with stands of single flowered varieties in twelve triplets set up with their own foliage, and Mr. Agate was 1st with the best varieties. Mr. Edwards, Witley Heights, Surrey, was 1st for six Japanese of one variety, and Mr. Molyneux was 1st in the any variety class with large and solid *Empress of India*, winning easily.

A Silver Cup was offered by Mr. W. Colchester for six incurved and six Japanese, grown with their special Ichthemic manure, Mr. Molyneux also won. The premier Japanese variety was a bloom *Stanstead White*, found in a stand set up by Mr. Penford.

Plants.—The 1st prize, a good one, for eight trained specimens, was easily won by Mr. Penford,

with healthy plants of 3 feet in diameter, currying good foliage and numerous flowers; Mr. G. Lambert, Gordon Terrace, Whyke Lane, Chichester, being 2nd. Mr. Penford was also 1st for one, a freely-flowered Elsie.

A novel yet good class was that for twelve distinct varieties in pots not exceeding 9 inches, inside measurement, and each to carry from six to twelve blooms. In this class, Mr. Barridge won 1st honours, with plants 2 to 4 feet high.

Groups of Chrysanthemums were few, and not very brilliant, and the plants mostly too tall.

Fruit.—A variety of fruits in season made good display. Mr. T. Hall (gr. to S. Montague, Esq.), Mr. N. Molyneux, Mr. J. Chalk (gr. to G. Road, Esq.), Messrs. Bunyard & Co., Mr. J. Watkins, Hereford, Mr. Mariner, (gr. to Lieutenant-Colonel Thistlethwayte, Drayton, Cosham), were the chief exhibitors.

DALSTON AMATEUR CHRYSANTHEMUM.

WEDNESDAY, November 4.—It is well-known in the horticultural world, that amateurs who apply themselves closely and earnestly to any branch of gardening, often excel in the production of plants, flowers, fruits, and vegetables requiring the utmost skill and attention; indeed it is not an uncommon occurrence in open competition for amateurs to defeat experienced gardeners. This results chiefly from the fact that devoting time and attention solely to one class of production gives the best chance of success in cultivation, and this is abundantly proved in the system adopted by market growers at the present time, namely, confining themselves to, and making a reputation for, a few plants, fruits, &c. which become specialties. In floriculture amateurs have done wonderful service, and amongst the Chrysanthemums especially, they have taken a prominent place in the ranks of successful exhibitors. Even in the least favourable districts, closely-pent populous localities of the metropolis and provincial towns, they have overcome innumerable difficulties, and presented the "Queen of Autumn" flowers in a condition highly creditable to themselves, eminently satisfactory to visitors, and offering every inducement to others to enter the ranks of those who engage in such a delightful, healthful, and admirable recreation.

Knowing what has been and can be accomplished in this way, a most agreeable surprise was still afforded by the fourth annual exhibition of the Dalston and De Beauvoir Town Amateur Chrysanthemum Society, which was opened by Lady Hunter at the Albion Hall on Wednesday, November 4. The hall is of moderate size, and its resources were taxed to the utmost to find space for the overflowing exhibits, contributed in competition and otherwise. Around the sides of the hall were groups of Chrysanthemums bearing abundance of brilliant flowers, while the centre tables were devoted to the cut blooms which were of satisfactory quality throughout, and in several classes would have taken a good place in much more extensive shows. There was a freshness and diversity which imparted a most pleasing character to the show, and it is almost needless to say that the committee had arranged the exhibits to the best advantage.

Glancing hurriedly at the winning contributions, we found that in the "Holmes Class" for thirty-six plants, Messrs. Rolt, Reid and Powell were the most successful, in the order named, the first also taking, in addition to the Silver-gilt Medal, a special prize of a Portable Greenhouse, presented to the society by "A Friend of Horticulture." The other two prizes were Silver and Bronze Medals respectively, and the plants in each case were well-grown healthy specimens. With twenty-four plants, Messrs. W. H. Miles, H. R. Pearce, and J. Mann, were the prize winners, the best twelve plants coming from Messrs. Prentiss, G. C. Young, and F. Pearce, and the best trained specimens from Messrs. Rolt and Reid.

The cut blooms were most praiseworthy, the Japanese bright and substantial, the incurved neat and refined. Mr. W. H. Miles had the best twenty-four blooms, twelve Japanese, and twelve incurved, thus winning the Silver Gilt Medal, and Mr. Toope's excellent heating apparatus presented as an additional prize. Mr. G. P. Rolt followed closely in this class, and was 1st with twelve Japanese and twelve Pompons, the latter wonderfully good.

Mr. Miles also had the best twelve, six incurved blooms and six Japanese. In the open classes, Messrs. Winter, Kendall, and Nye were the winners for twelve blooms.

Amongst the non-competing exhibits, Messrs. J. Laing & Sons, Forest Hill, had a valuable collection of foliage plants and Heaths. Mr. H. J. Jones, of Lewisham, sent thirty-six handsome cut blooms, and Mr. C. Gibson, Morden Park Gardens, a well known exhibitor at the leading shows, had twenty-four fine cut blooms, all which added materially to the interest and beauty of the exhibition.

Altogether the Society had good reason to be satisfied with the result of their endeavours, and it is evidently performing valuable service in the district. The committee with their chairman, Mr. Hill, and secretary, Mr. Butler, deserve especial congratulation upon the work performed, which should give ample encouragement to proceed on the same lines.

PUTNEY, WANDSWORTH, AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 5, 6.—The committee of this suburban society made a bold departure this year by carrying its annual show right into the heart of smoky Wandsworth, holding it in the spacious Town Hall, where there was elbow-room. We hope the greater attendance amply justified the change. A few remarkably fine groups of Chrysanthemums were staged, the leading one set up by Mr. Springthorpe, gr. to R. W. Alexander, Esq., Rye-hampton, being pronounced by the judges one of the best and most effective they had yet seen—very high praise for Wandsworth that. Mr. Dark, gr. to J. Hooker, Esq., Putney, whose group came 2nd, had perhaps the best quality in his blooms, but his grouping was ineffective.

Trained plants were plentiful—some excellent. Mr. Bentley, gr. to W. J. Bosworth, Esq., Rye-hampton, had the best four incurved varieties, and Mr. Springthorpe the two best Japanese, in fine plants of Mdle. Lacroix and Madame de Sévigné.

Pompons were plentiful, the best perhaps being the standards Black Douglas, Golden Madame Marthe, and a white variety, which were specially good.

Ferns in fours were exceedingly good. The best lot came from Mr. E. Moe, gr. to F. T. Delcoyne, Esq., Clapham Common, these comprising very fine specimens of *Adiantum concinnum latum*, *A. Farleyense*, *A. trapeziforme*, and *Nephrolepis rutescens tripinnatifida*. Other lots included very fine *Davallia Mooreana*, *Gymnogramma chrysophylla*, *Asplenium bulbiferum*, and *Microlepia hirta cristata*.

The prettiest miscellaneous group of plants came from Mr. Portbury, gr. to W. N. Troy, Esq., Putney Heath; *Bouvardias*, *Cyclamens*, and *Cypripediums*, formed the chief floral feature.

Mr. Methuen, gr. to W. Heiller, Esq., Wimbledon Park, had the best four stove and greenhouse plants in Crotons and Palms. Quantities of scarlet pink, and other coloured zonal Pelargoniums; Chinese Primulas, Capsicums, &c., lent welcome colour to the show. The best of these latter were the erect short red, the yellow drooping Prince of Wales, and the long red Currant or Grape varieties. All blooms of Chrysanthemums were fairly good, but behind the shows of some previous years. The best twenty-four Japanese were shown by Mr. Knowles, gr. to Mrs. Egerton, Rye-hampton, who seemed to be equally invincible in other classes, as he was also 1st for twelve Japanese, and for twenty-four and twelve incurved. From his stands were selected the premier Japanese bloom, a rather loose Stanstead White, and the incurved John Doughty, a capital flower; Jeanne d'Arc, Alfred Salter, and Refulgence were also capital blooms.

Fruit.—Apples and Pears were remarkably good, indeed, finer in their respective classes of kitchen and dessert Apples could hardly have been found. These were all the produce of small private gardens, and exhibited a wonderful advance on what used to be seen on the show tables. Atristron, Lord Derby, Warner's King, Blenheim Pippin, Gloria Mundi, Mère de Méoage, New Hawthornden, and Wellington, were fine; as also were Cox's Orange, King, and Ribston Pippins, of dessert varieties.

Pears, too, were good; Marie Louise, Beurré Diel, Beurré Hardy, Pitmaston Duchesse, &c., being excellent. The residents of Wandsworth who see only such fruit as the shops display, must indeed have marvelled when they gazed upon the fine samples placed before them on this occasion.

CRYSTAL PALACE.

NOVEMBER 6, 7.—Some very fine groups of Chrysanthemums and grandly-developed blooms were the leading features of this exhibition. As is usual the

groups were at the sides of the nave, the flowers arranged on tables in the centre, and the plants following on at the eastern end.

Cut Blooms.—There were seven collections of forty-eight varieties, and Messrs. W. & G. Drower, nurserymen, Fareham, received the 1st prize, their twenty-four incurved, and same number of Japanese being very fine. Among the newer flowers of the former were Mrs. S. Coleman, J. Doughty, Violet Tomlin, Miss M. Haggas, the Queen, Princess, and Empress types being very good.

Among the Japanese were grand blooms of W. H. Lincoln, Stanstead White, Mrs. Falconer Jameson, Mrs. C. Wheeler, a grand variety of the character of Edwin Molyneux, but more refined; Etoule de Lyon and Sundower were finely coloured. 2nd, J. W. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon, came in a good 2nd.

There were five collections of eighteen incurved, and Mr. Whittle, gr. to C. H. Goschen, Esq., Bal-lards, Addington, was placed 1st, having in fine character Violet Tomlin, John Lambert, Jeanne d'Arc, and other leading varieties admirably finished; Mr. Cox, gr. to J. Trotter, Esq., Brickendon, Hertford, was 2nd, with a capital lot of flowers. Also out of eight competitors, the 1st prize for twelve incurved was taken by Mr. J. Hughes, gr. to H. F. Paravicini, Esq., Bracknell, Berks, who had, in the best form, Alfred Salter, John Salter, Queen of England, Lord Alcester, Violet Tomlin, and John Doughty; 2nd, Mr. A. Felgate, Buckhill, Walton-on-Thames, whose stand was only just inferior to the 1st.

The class for six incurved, one variety, was very interesting; and Mr. A. Turner, gr. to F. Murray, Esq., Woodcote Hall, Epsom, was placed 1st, with superbly-finished blooms of Princess of Wales; and Mr. A. Felgate 2nd, with Queen of England—ten exhibitors competing.

Japanese blooms were superb; not only were they large in size, but superbly coloured for such a season. The best eighteen came from C. E. Shea, Esq., Fooks Cray, Kent, who had, in admirable form, the new Vivand Morel, Mrs. Falconer Jameson, Boule d'Or, Coronet (a very fine deep yellow incurved flower), a superior Taunberg, W. W. Coles, W. H. Lincoln, &c.; 2nd, Mr. Glen, The Gardens, Worth Park, Crawley, his Stanstead White being very fine and Triomphe de Lyon superbly coloured.

There were nine collections of twelve varieties, and Mr. James Douglas, gr. to Mrs. Whitbourn, Great Gearys, Hord, was 1st, with a finished lot of blooms, such as Etoule de Lyon, Boule d'Or, Avalanche, Mons. Berard, Sunflower, Puritan, Stanstead White, &c.

There were thirteen stands of six blooms of one variety, and Mr. C. Cox was 1st, with splendidly-finished Avalanche; and Mr. Glen was 2nd, with the same. This variety took the 1st prize, thus vindicating its claim to be regarded as the most symmetrical and beautiful flower grown. Next season Vivand Morel may possibly dispute its primiership.

Reflexed and Japanese reflexed were somewhat sparingly represented. The best stand of twelve blooms came from Mr. Felgate, who had the usual varieties in good form; the reflexed flowers were very attractive, and it seems a pity they are not shown in greater numbers.

Anemone-flowered were in good character, and the best eighteen (Japanese varieties being admissible) came from Mr. W. Green, gr. to Miss Wyburn, Hadley, Barnet, and their singular character appeared to attract a good deal of attention; Jean Marty, Mrs. Judge, Benedict, Gladys Spaulding, Nouvelle Alveole, L. Denil, Lady Margaret, Glück, and Acquisition are among the best.

Pompon varieties were sparingly represented, and, owing to being much dislodged, the flowers were generally large; and to many, out of character. But the pretty Pompon Anemones are delightful, and one wonders they are not more grown. Mr. C. J. Salter was 1st, with twelve bunches of three blooms, the following being specially attractive, Aglaia, Perle, Madame Montels, Caliope, Briolus Antonius, and Sadawa.

Groups were a remarkable feature. The best fitting a space of 100 feet, came from Mr. J. Townsend, nurseryman, Putney.

In the class for a group of Japanese only, Messrs. Reid & Bornemann, nurserymen, Sydenham, was 1st; and Messrs. James Carter & Co., Holborn and Forest Hill, 2nd, with bold and striking semi-circular groups of high quality.

In the class for group of 50 feet, the best came from Mr. A. Hex, gr. to the Rev. C. H. Spurgeon, Westwood, Upper Norwood, very neatly edged with Ferns. Trained plants showed a great falling off com-

pared to what was seen at the Palace shows of fifteen and twenty years ago. The best came from Messrs. Cherry, Clarke, Weston, and Cooper.

Messrs. Carter & Co.'s special prizes for six dishes of Potatoes brought several very bright collections, Mr. E. S. Wills, of Edgcote Park, taking the 1st prize with perfect tubers.

BIRMINGHAM.

NOVEMBER 11.—The thirty-first annual exhibition took place in the Town Hall, and notwithstanding the wretched weather of the first day, there was a very large attendance.

The principal prizes were those of £20, £15, and £10, for forty-eight blooms, twenty-four incurved and twenty-four Japanese, distinct, for which there were twelve competitors. Mr. Parker, gr. to J. Corbett, Esq., M.P., Impney, Droitwich, staged the best lot, the Japanese being universally acknowledged by the judges to be wonderfully fine.

In the class for twenty blooms, Mr. Parker was again 1st. For eighteen incurved, distinct, Mr. Parker was again 1st, with a fine lot.

For twelve Japanese, distinct, 1st, Mr. Coombes, gr. to the Dowager Countess of Dudley, Himley.

Classes were set aside for twelve and twenty-four *Chrysanthemum* blooms, grown in Birmingham; and Mr. Brasiere, gr. to Sir Thomas Martineau, was 1st in each class, and was closely followed by other exhibitors.

The specimen plants were very fine. In the classes for nine and six, Mr. Dyer, gr. to Mrs. Marigold, was well 1st; Sir Thomas Martineau and Mr. Cadbury running very close. Mr. G. Cadbury's three magnificent Pompons were the only lot staged, and more than deserved the 1st prize.

Fine large Groups were staged, the 1st, 2nd, and 3rd lots running very close together: 1st, Mr. W. H. Dyer, gr. to Mrs. Marigold.

Chinese Primulas also made a grand display. The 1st prize and *Gardeners' Magazine* Medal in the open classes was taken by Messrs. Thomson & Co. of the Sparkhill Nurseries.

For six stove and greenhouse plants, five lots were staged in competition, and two lots of six Orchids were put up, very fine specimens, exhibited by W. Bowd, Esq. (gr. to Mr. W. Palmer), taking the 1st prize, and the 2nd going to the Right. Hon. Joseph Chamberlain, M.P. (H. A. Burberry, Orchid grower), for single specimens of great merit.

Grapes were not so numerous as usual, but some were of excellent quality, especially the three bunches of Muscats and the single bunch of Muscats, all well finished and coloured, exhibited by Mr. Harman, gr. to the Earl of Denbigh, which took the 1st prize in each class. In the class for six bunches of black Grapes, Mr. Slade, gr. to the Duke of Newcastle, was 1st, with a bunch each of Alnwick Seedling, Gros Colmar, Gros Maroc, Mrs. Pearson, Muscat of Alexandria, and Duke of Buccleuch. In the class for three bunches of black Grapes there were nine exhibitors.

Apples were largely exhibited, many of them being very fine. For six dishes of culinary and six dishes of dessert Apples, Mr. Goodacre, gr. to the Earl of Harrington, was 1st, with two very fine exhibits; and Mr. Austin, Witley Court Gardens, was 1st for six and four dishes of Pears.

There was a fine display of vegetables in competition for Messrs. Sutton's prizes for a collection, there being twelve exhibits; and nearly as many for Mr. R. Sydenham's prizes for collections of vegetables, Mr. Greatorex taking the 1st prizes.

Messrs. Pope & Sons, Messrs. Thomson & Co., Messrs. Hewett & Co. staged honorary exhibits, to which Certificates were awarded.

HORTICULTURAL EDUCATION IN KENT.

THE Technical Education Committee of the Kent County Council has devised a scheme for the creation of county scholarships and the selection of county scholars at the Horticultural College, Swanley, Kent, under certain conditions, of which we can only mention a few, and those in a condensed form. Twenty-five scholarships are established, tenable at the college for two years, from January 20, 1892. In respect of fifteen of such scholarships, the committee will pay the whole of the fees due to the college in respect of each scholar. In respect of the remaining ten scholarships, the committee will pay half of such

fees. The fees to be paid to the college in respect of each scholar selected under this scheme amount to £60 per annum, and cover the cost of instruction, board, lodging, and surgical and medical attendance, and all books, apparatus, implements, and appliances, convenient or proper in connection with such instruction. The subjects in which instruction is provided at the college comprise—Horticulture: Orchard trees, bush fruits, fruit borders, fruit culture under glass, pruning, grafting, harvesting and marketing. Mushrooms, Tomatos, vegetables, salads, flowers, hybridisation and propagation, soils, manures. Dairy-work. Poultry-rearing. Bee-keeping. Applied Science: Zoology and general biology, natural history in relation to plant-life, botany, chemistry, horticultural chemistry, geology, meteorology, heat, light, dynamics, hydrostatics and hydro-dynamics, the steam-engine, measuring and surveying, levelling, drawing, building construction, horticultural building, materials, book-keeping, law relating to horticulture. The instruction embraces lectures, classes, laboratory practice and outdoor work under qualified instructors. All students are entitled and required, so far as health and other circumstances permit, to take part in the practical and experimental work of the college in the grounds, glasshouses, and workshops. The scholarships will be granted to three classes of candidates, as follows: Class I. Pupils or past pupils of elementary schools within the meaning of sec. 3 of the Elementary Education Act, 1870, not being teachers, assistant-teachers, or pupil-teachers included in Class II. By sec. 3 of the Elementary Education Act, 1870, the term "elementary school" means "a school, or department of a school, at which elementary education is the principle part of the education there given, and does not include any school or department of a school at which the ordinary payments in respect of the instruction, from each scholar, exceed ninepence a week." Class II. Teachers, assistant teachers, and pupil-teachers in such schools. Class III. Persons (other than those included in Classes I. and II.) who are not, and whose parents are not, in receipt of more than £400 a year from all sources, *i.e.*, who are allowed an abatement of the income tax. The twenty-five scholarships will be awarded among the three classes of candidates as follows: ten to Class I, five to Class II., and ten to Class III. The committee will pay the whole of the fees in respect to scholars in Classes I. and II., and half the fees in respect of scholars in Class III. Candidates must be males, and of not less than sixteen nor of more than twenty years of age on January 1, 1892, must have been domiciled in the county for six calendar months prior to that date, and must possess characters satisfactory to the committee. Each of such twenty-five districts is to be entitled to have one scholar at the college, and with that object is to be entitled to the nomination of five candidates for such scholarship, which five candidates may belong to any one or more of the three classes of candidates before mentioned at the option of the district. From the candidates nominated by each district one will be selected for a scholarship. The committee reserve the right upon the representation of the authorities of the college to remove any scholar whose conduct or progress is, in the opinion of the committee, unsatisfactory, and to supply the vacancy so created by the selection of another scholar from the district from which the scholar so removed was originally selected or from any other district. The scholarships will be awarded by the committee according to the result of an examination to be conducted by or under the direction of the committee, and to be held on Tuesday, December 29, 1891, at 10 30 A.M., at the following four centres or such of them as the committee may determine after the wishes of the candidates in respect thereof shall have been declared upon the nomination papers: Gravesend, Tunbridge, Canterbury, and Ashford. The examination will comprise the following subjects:—1. English; 2. Mathematics; 3. Theoretical Mechanics; 4. Inorganic Chemistry; 5. Physics;

6. Botany and Horticulture. Candidates in Class I. will be examined in the following branches of subjects 1 and 2 only [Elementary]. Candidates in Classes II. and III. will, in addition to more advanced questions upon the branches of subjects required from candidates in Class I., be examined more fully in some of the above-named subjects. In Subject 6, the examination will comprise characters of the root, stem, leaves, and parts of the flower, as illustrated by specimens of common flowering plants; structure of wood, bark, and pith; cells and vessels; food of plants, and manner in which a plant grows; functions of the root, leaves, and different parts of the flower; the comparison of a Fern and a moss with a flowering plant; the formation of different kinds of fruits; the structure of a Bean, and a grain of Wheat or Barley; the phenomena of germination. In this subject, in addition to the branches specified, a few elementary questions in practical horticulture will be set. Further particulars can be obtained from Mr. FRAS. W. CROOK, Secretary, Sessions House, Maidstone.

THE BORDEAUX MIXTURE.

SOME EXPERIMENTS ON THE PREPARATION AND EFFECTS ON VEGETATION OF THE BORDEAUX MIXTURE.

HAVING recently had brought under our notice the fact, that under certain circumstances the application of Bordeaux Mixture to the foliage of young Potato plants may lead to a certain amount of injury to their foliage, it appeared desirable to show how this unfortunate result could happen. We have heard so far of nothing but favourable results following this treatment of the Potato disease. I may say that, personally, the first intimation I received was a letter from an unknown correspondent asking details of the Jensenian method, alleging as a reason that the Bordeaux Mixture had been found an utter failure. I do not mean that these were the exact words used, but that was the sense of the communication. Naturally I felt surprised; but in the course of a few days, the *Gardeners' Chronicle* appeared with a fuller account of the experiment upon which my correspondent had based his unfavourable opinion on the matter.

It is a well-known fact that powdered sulphate of copper, dusted on the leaves of living plants, will destroy those tissues with which it comes in contact. But it is not so well known that a solution of sulphate of copper, however weak, will do the same. The explanation is simple enough. It is simply a question of concentration. The drops on the plants evaporate, and, of course, the solution becomes stronger in each one until nothing remains but the solid copper sulphate, which soon shows its presence by producing brown or black spots, and consequent destruction of leaf-tissue.

In the Bordeaux Mixture, the copper sulphate is decomposed by lime into the hydrated oxide of copper, which body has been found by experience to be fatal to the spores of the *Phytophthora*, and indeed to most other parasitic fungal spores, while it does no injury to the foliage of the host-plants.

On October 28, two samples of 3 per cent. Bordeaux Mixture were made by my friend Dr. H. C. Brown. No. 1 was made with some quick-lime which had been bought two or three days before for another purpose. It was said to be freshly-prepared good lime, and answered the purpose for which it was originally obtained quite well. We found, however, that the Bordeaux Mixture made with it gave a distinctly acid reaction with blue litmus paper, and what was of much more importance, the supernatant liquor contained large quantities of copper in solution, a copious precipitate being obtained with the ferrocyanide of potassium. On the following morning the Mixture was still acid, and gave an abundant precipitate with the ferrocyanide, although not so copious as it did the night before. After four days, *viz.*, on November 1, the supernatant liquor still showed traces of dissolved copper, but this was much

reduced in quantity—reduced to a trace; the reaction was faintly acid. The lime used for this mixture was apparently good. The addition of water to it caused it to become warm, but not distinctly hot.

No. 2 solution was made in exactly the same way, and with the same quantities, but the lime was freshly burned, and evolved great heat when water was applied to it. In this case the Bordeaux Mixture had an alkaline reaction, and no trace of copper could be found in the supernatant liquor of the ferrocyanide test. I may say that the lime used for No. 1 was obtained by myself, and that I had no idea but that it was (as it was said to be) good quick-lime until after the solution was made, and we found traces of dissolved copper in the supernatant liquor. This led us to try the effect of using another sample of really quick-lime. It is clear that a person not alive to the importance of having a mixture free from undecomposed copper sulphate would never have dreamed that his Bordeaux Mixture was not properly made, but it is equally clear that had it been used upon the foliage of young plants of any sort, especially upon that of young Potatoes, it would have produced most disastrous results.

No. 1 solution was left in Dr. Brown's laboratory for four days, until November 1. It had then lost nearly all trace of copper, but for the sake of seeing what effect it would produce, a quantity was sprayed upon the young shoots of a Tomato plant. It contained such a minute quantity of free copper sulphate that we did not expect any result could be produced, but after the lapse of three days its influence was distinctly visible upon the leaves.

As control experiments to test the effect of dissolved copper sulphate upon the foliage of living plants, Dr. Brown prepared three solutions, containing 1 per cent., 2 per cent., and 3 per cent. of copper sulphate respectively.

The 1 per cent. solution was, on November 3, sprayed upon the young shoots of a Tomato plant, upon some seedling plants of Pyrethrum, Celery, Lobelia, and a plant of Ranunculus bulbosus.

The 2 per cent. solution was applied to a Tomato, a Calceolaria, and a young plant of Clover.

The 3 per cent. on a Marguerite Daisy plant, a Scabious, and on a Tomato.

On the following morning all these plants, without exception, had their foliage blackened. Those to which the 1 per cent. solution had been applied were somewhat less injured than those upon which the stronger solutions had been sprayed, but the effect was the same upon all, and the differences much less than one would have expected. Specimens of the injured foliage are sent herewith. *Charles B. Plowright, M.D., King's Lynn, Nov. 9, 1891.*

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

HEATING BY STEAM.—*Amateur* asks if any of our readers will kindly give him some information on this method of heating. Is it cheaper than hot water, and what are its disadvantages? Why is it not more in use?

CIDER MAKING.—Can any of our readers inform "A. W., Hereford, November 9, 1891," the best method of using Hops and sugar, to increase the body and keeping-qualities of cider. How are they applied? and in what quantities per hogshead of 54 gallons?

POTATOS.

Market values remain steady, but with supplies in comparison with last year's arrivals the trade would see lower prices. Taking the cue from the market values at the commencement of this year for last year's crops, the farmers generally are speculating for the same results. We may have weather to correspond with that of last winter, but he who should speculate on such a possibility would be a "plunger," besides taking into consideration what would happen with a mild winter. Market values now about 15 per cent. higher than last year, with 30 per cent. less supplies. All other kinds of vegetables remain low, which have a great influence on the price of Potatos throughout the season. *J. B. Thomas.*

SEEDS.

LONDON, Nov. 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report an improved feeling for Clover seeds generally. American Red is called 1s. higher. Blue Peas continue in strong request at full prices. Haricot Beans are now moving upwards. White Runners offer at reasonable figures. Canary seed, having lain dormant for some years, exhibits a sudden upward jump of several shillings. Hemp seed is also firmer. For Rye there is an improved demand at enhanced quotations. Winter Tares are unchanged. Mustard and Rapeseed keep steady. Linseed, Buckwheat, Millet, and Dari realise former terms.

FRUITS AND VEGETABLES.

SPITALFIELDS: Nov. 10.—Quotations:—Brussels Sprouts, 1s. to 2s. per half-sieve; Parsnips, 4d. to 9d.; Cos Lettuce, 4d. to 9d. per score; Endive, 4d. to 1s.; Cabbage Lettuce, 3d. to 9d.; Leeks, 1s. 6d. to 2s. 6d.; frame Cucumbers, 1s. to 1s. 9d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 4s. 6d. to 5s. 6d. per cwt.; Belgian do., 2s. 9d. to 3s. 3d.; Dutch do., 3s. to 3s. 9d. per bag of 110 lb.; Spanish do., 6s. to 6s. 6d. per case; Celery, 4d. to 1s.; Horseradish, 1s. to 1s. 1d. per bundle; Cabbages, 1s. to 1s. 6d.; and Savoy, 2s. to 3s. 6d. per tally; Greens, 1s. to 1s. 6d.; Turnips, 2s. to 2s. 3d.; Carrots, 1s. to 2s. 6d.; Onions, 2s. to 2s. 6d.; Parsley, 1s. 6d. to 2s. 6d. per dozen bunches; Spinach, 1s. to 1s. 6d. per bushel; English Apples, 2s. 6d. to 6s. per bushel; American do., 10s. to 18s. per barrel; Pears, 1s. to 2s. per half-sieve; English Tomatos, 4s. to 7s. 6d. per peck; foreign do., 1s. to 2s. per box.

BOROUGH: Nov. 10.—Quotations:—Cabbages, 2s. 6d. to 4s. 4d. per tally; Broccoli, 3s. to 5s. do.; Turnips, 1s. to 1s. 6d. per dozen bunches; Carrots, 1s. to 1s. 9d. do.; English Onions, 4s. 6d. to 5s. per cwt.; English Apples, 2s. to 9s. per bushel; Pears, 2s. 6d. to 7s. do.; Canadian Apples, 12s. to 25s. per barrel; and Newtown Pippins, 20s. to 50s. do.

STRATFORD: Nov. 11.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. 6d. to 3s. 6d. per tally; Savoy, 3s. to 5s. do.; Greens, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 9d. to 1s. 3d. per dozen; do., 4s. to 6s. per tally; Turnips, 2s. to

2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 40s. to 50s. do.; do., cattle-feeding, 26s. to 32s. do.; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; Spinach, 1s. to 1s. 3d. per sieve; Carrots, 1s. 6d. to 2s. 6d. per doz. bunches; Horseradish, 1s. 2d. to 1s. 3d. per bale; Parsnips, 65s. to 70s. per ton; Mangels, 15s. to 18s. do.; Swedes, 20s. to 25s. do.; Onions, English, 100s. to 120s. do.; do., Dutch, 3s. 9d. to 4s. 6d. per bag; do., Oporto, 6s. to 6s. 6d. per case; Apples, English, 2s. to 6s. per bushel; do., American, 12s. to 22s. per barrel.

POTATOS.

SPITALFIELDS: Nov. 10.—Quotations:—Snowdrops, 60s. to 80s.; Early Rose, 50s. to 70s.; Hebrons, 60s. to 80s.; Imperators, 60s. to 80s.; Champions, 50s. to 65s.; Regents, 60s. to 80s. per ton.

BOROUGH: Nov. 10.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 55s. to 80s.; Bruces and Magnums, 60s. to 90s. per ton.

STRATFORD: Nov. 11.—Quotations:—Magnums, 65s. to 85s.; Imperators, 65s. to 80s.; Elephants, 65s. to 80s.; Snowdrops, 70s. to 80s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending Nov. 7, and for the corresponding period last year:—1891, Wheat, 35s. 7d.; Barley, 30s. 11d.; Oats, 2s. 6d. 1890, Wheat, 32s. 1d.; Barley, 29s. 5d.; Oats, 17s. 5d. Difference: Wheat, +1s. 6d.; Barley, +1s. 6d.; Oats, +3s. 1d.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; do., inferior, 40s. to 75s.; hay, best, 60s. to 92s.; do., inferior, 26s. to 50s.; and straw, 20s. to 40s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 7, is furnished from the Meteorological Office:—

"The weather of the week was quiet and dry generally, although a good deal of haze or fog prevailed over Great Britain, and the sky was often very cloudy or overcast.

"The temperature was 3° below the mean in the 'Channel Islands,' and 2° below in 'England, N.E.

and S.W.'; in the other parts of the Kingdom it did not differ materially from the normal. The highest of the maxima were recorded either on the 1st or 2nd, and varied from 57° in 'England, E. and S.', to 52° in 'England, N.E.' During the latter part of the week the daily maxima were generally below 50°. The lowest of the minima were registered during the early morning of the 1st, and varied from 26° in the 'Midland Counties,' and 27° in 'Scotland, E.', to 31° in 'England, S.W.', and 37° in the 'Channel Islands.'

"The rainfall has been much less than the mean in all districts. In several of the more southern and western localities, the fall has been scarcely appreciable.

"The bright sunshine has been very deficient in nearly all districts; in the 'Channel Islands,' however, there has been a considerable excess, the percentage of the possible duration having been as high as 66. Elsewhere the percentage ranged from 23 in 'England, S.', and 18 in 'England, E. and S.W.', to 1 in 'Scotland, W.', whilst in 'England, N.E.', the amount being less than half an hour, was not appreciable as a percentage of the possible duration."

VARIORUM.

THE OPIUM POPPY.—In Persia, where there is a liberal supply of water for irrigation, and in the close vicinity of the village, are to be seen the fields of the Opium Poppy, more especially since the failure in the silk crop, as, wherever the villages have suffered from the disease amongst the silkworms, the inhabitants have taken to the culture of opium, resulting in a complete demoralisation of the villagers, who, almost as a whole—men, women, and children—have adopted the pernicious practice of eating, besides many of smoking, the drug. In Afghanistan there is little opium grown, and the wholesale demoralisation is absent. At Bezd and other villages in Persia, children came to me asking for some means of getting rid of the habit, and out of every small crowd of children who used to surround my tent, coming to see the stranger, one or two could be picked out from amongst the number, from their haggard looks and peculiar pasty complexion, as being addicted to smoking the poison. The eaters look upon the habit of smoking as an enormity that they would never adopt. Large quantities of opium are traded in between the villages and towns, but what became of it after that I could never find out. The people were very reticent in talking about the trade in opium—I suppose, owing to the heavy Government tax upon its cultivation and sale. The oil of the seeds is much used for burning, as also for food, and the seeds are eaten in sweetmeats. *J. E. T. Aitchison's Notes on Products of Afghanistan and Persia.*

NOTICES TO CORRESPONDENTS.

ACER NEGUNDO: *H. C.* The fungi on your tree come after the tree has been injured by frost or wounds of any kind, and are not themselves a cause of disease, provided the bark be uninjured. It is extremely common on dead twigs of all kinds. There are two forms, one in the form of smooth pink pimples, the other in that of small groups of pimples or tubercles, but both forms belong to the same species of *Nectria cinnabarina*.

CORRECTION.—In our report of the Watford Chrysanthemum Show, Mr. Neve was inadvertently spoken of as gr. to H. H. Gibbs, Esq., M.P., instead of Mr. E. Beckett, who was the winning exhibitor in the principal classes. Mr. Neve was awarded first honours in other classes.

FIELD FOR GROWING MUSHROOMS: *Mushroom.* A thick dressing of fresh horse droppings dug in, or buried in patches a few yards apart, and covered with 6 inches of soil, and well trodden into a firm mass, might have the effect of inducing Mushrooms to grow in the field. The land should be made very firm by rolling it when the soil has settled after the digging. Getting these esculents to grow in fields is an uncertain business.

DAFFODILS AND SNOWDROPS IN GRASS: *A Subscriber.* We have never heard of any case of cattle being poisoned from eating the leaves of these plants; still, both contain poisonous matter.

GREASE BANDS FOR FRUIT TREES: *West.* Common cart-grease will answer the purpose. It should be spread on bands of thick paper, 6 inches wide,

which with an underlay of grease-proof paper of the same width, may be fastened with string or wire round the stems, 2 feet from the ground. If the greased paper band could be so cut as to bend over away from the stem at the top, it would answer the purpose it is intended for better than a flat band. The bands should be on the trees ere this, and they will require occasionally smearing anew.

HEAVY GOOSEBERRIES: *A. F. Z.* London, Catherine, Thumper, Macaroni, Rifleman, Lancashire Lass, Roaring Lion, and many others. Apply at any good fruit nursery.

INSECTS: *B. & Son.* The white maggots which are destroying your old crimson Clove plants, by eating out the heart of the stems at the base of the leaves, are the larvae of a two-winged fly, allied to the Lettuce fly (*Gardeners' Chronicle*, 1841, p. 364, *Anthomyia lactuca*). The plants show the presence of the maggots by the withered leaves, which should be picked and burnt. We will try to rear the fly. *I. O. W.—J. S.* The egg-cases and eggs of the Vaporer moth.—*W. W.* The eggs of the Lackey moth.

LARGE GOOD PEARS, ETC: *A. F. Z.* Jargonelle, William's Bon Chrétien, White Doyenné, Beurré Bosc, B. Diel, B. d'Areberg, B. d'Amanlis, Thompson's Napoleon, Colmar d'Or, Hacon's Incomparable, Louise Bonne de Jersey, Marie Louise, Marie Louise d'Uccle, Madame Treyve, Glout Morceau, Vicar of Winkfield, Easter Beurré, and, where it does well, Knight's Monarch. There are several other good trustworthy varieties, but they cannot be called large fruits. We know of no such Celery as you mention.

NAMES OF FRUITS: *S. Reginald.* Small specimen of Margil.—*A Constant Reader.* 1, Marie Louise; 2, Beurré d'Amanlis; 3, smashed; 4, Josephine de Malines.—*A. E. Liddington.* Rymer.—*C. W. D.* London, or Five-crowned Pippin.—*Constant Reader.* Pear: Bellissime d'Uliver.—*J. A. I.* Yorkshire Greening; 2, King of the Pippins; 3, not recognised; 4, Dumelow's Seedling.—*D. I.* Bedfordshire Foundling; 2, Striped Beefing; 3, Beauty of Kent; 4, Beurré de Capiaumont; 5, Winter's Bon Chrétien; 6, Beurré; Durham.—*G. McDonnell.* Apple: Glorie Mundi. Pears: 1, Styrian; 2, Vicar of Winkfield; 3, Old Crassane; 5, Duchesse d'Angoulême; 7, Marie Louise; *W. L.* Colonel Vaughan.

NAMES OF PLANTS: *J. M.* *Strelitzia regina*; ordinary stove treatment; water freely during growth, but very sparingly, when the plant is at rest.—*G. C.* *Abies Veitchii* (true), and *A. pectinata*, the Silver Fir.—*C. T. D.* What used to be called *Usnea florida*.—*J. T. L.* 1, *Grevillea* or *Lomatia*—send when in flower; 2, *Hemanthus albidus*; 3, *Cologyne fuliginosa*.—*C. D. I.* *Davallia pyxidata*; 2, *Pteris serrulata cristata*; 3, *Cyrtomium Fortunei*; 4, *Pteris longifolia*; 5, *Cheilanthes elegans*; 6, *Aspidium (Nephrodium) molle*.—*George.* 1, *Retinospora pisifera*, var. *filifera*; 2, *Retinospora pisifera*, var. *plumosa*; 3, *Thuiopsis dolabrata*; 4, *Thuiopsis borealis*; 5, *Thuya orientalis*, var. *Sieboldii*; 6, *Libocedrus decurrens*.—*J. T. L.* Source d'Or.—*W. L.* *Pandanus javanicus variegatus*. The fruit is not edible, but the plant is ornamental, and it is sometimes employed for table decoration.

NICHOLSON'S Gardeners' Dictionary: *A. A. T.* The work is published by Upcott Gill, 170, Strand, W.C. The report of the Conifer Conference is not yet published.

SACRED LILY OF CHINA: *D. W.* *Narcissus tazetta*, mentioned in these columns, p. 277, February 28 this year, and p. 468, April 13, 1889, where it is also figured; directions for growing the bulbs in a bowl of water being there given.

SHOW REPORTS.—Owing to the great pressure on our space, several of these are deferred to our next issue.

SULPHATE OF COPPER: *S. H., New Zealand.* See our present issue. We do not think any advantage would accrue from its use in the case of the Phylloxera.

AUTUMN and WINTER PRUNING,

TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S Celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTICUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Illustrated CATALOGUES can be had, post-free, from the PATENTEES and MAKERS, at their works and dépôt, ST. ALKMINND'S CHURCHYARD, DERY; or of the principal Ironmongers and Seedsmen, the leading stores, and kindred trades throughout the world.
